As a continuation of our studies on the synthesis[1,2] and reactivity[3-8] of pyrrolo- and furano-2,3-dione, we reported that quinoline-2,4-dione reacted with oxalyl chloride to afford oxazolo[3,2-a]quinolone.[9] Prompted by these results, we investigated the reaction of oxalyl chloride with N-substituted quinolones **1a,b** and 4-hydroxycoumarin **1c**. Since, the fusion of a furan-2,3-dione ring to quinolone or coumarin systems might influence their reactivity, it was thought desirable to synthesize systems having both rings.

Reaction of the sodium salt[10] of N-substituted quinolones **1a,b** with an equimolar ratio of oxalyl chloride in dry toluene at 60°C gave yellow furo[3,2-c]quinolones **3a,b** in 73% and 75% yield respectively (*Scheme 1*). Elemental analyses and spectral data helped characterize the

structure of the products. The IR spectrum of **3a** displayed characteristic absorption bands at 1835, 1780 and 1645 cm^{-1} for three CO groups. Its ^1H NMR showed the absence of a singlet[9] at δ 6.19 (=CH) and the ^{13}C NMR spectrum exhibited signals at 188.1, 161.1 and 157.2 for three C=O groups.

Reaction of 4-hydroxycoumarin **1c** with oxalyl chloride, in the presence of 4-dimethylaminopyridine[11] at reflux in 1,2-dichloroethane for 8 h, gave acid chloride derivative **2c**[1,12] (not isolated), which was then cyclized to 2,3-dioxo-2,3-dihydrofuro[3,2-c]coumarin-2,3,4-trione **3c** with anhydrous aluminum chloride in 1,2-dichloroethane. The elemental analysis and spectral data (*see Experimental Section*) were consistent with the assigned structure. The reactivity of **3a**

was examined by reactions with phenols and aromatic amines to give ester and amide derivatives[13,14] **4** and **5** respectively. The ester **4a,b** was formed from the reaction of phenols with furo[3,2-c]quinolone **3a** at rather low temperature,[15] namely 70-75°C, as shown in *Scheme 2*. In

the presence of a CH signal at δ 4.54 and 4.56, the ^{1}H NMR spectra of **5a,b** indicates that the *keto* form is the only one present. The ^{13}C NMR of **5a** shows characteristic signals at 28.52 (NCH_3), 78.58 (CH), 154.00 (CO of amide), 154.87 (C-2), 191.0 (CO) and 194.8 (C-4). Several attempts to cyclize the amide derivative **5** to pyrroledione **6** by using polyphosphoric acid or acetic anhydride as the dehydrating agent were not successful. It is worth noting that heating **5a,b** above its melting point in diphenyl ether gave **7a,b** in 32% and 42% yield respectively by extrusion of carbon monoxide. Elemental analysis and spectral data confirmed the structures of **4**, **5** and **7**.

Thermolysis of **3a** in diphenyl ether at reflux for 20 min gave α–oxoketene intermediate **8** in a way similar to that which we reported recently.[6,13] The formation of **8** was established by trapping with different heterocumulenes, *e. g.* phenyl isocyanate and Schiff's base to give oxazinedione **9** and oxazine derivatives **10a,b** respectively as shown in *Scheme 3*.

The chemical shift of C-2 in **9** and **10** is in the region usually known from O-C-N system.[6,16] The assignment of all ring carbons of **9** and **10** provided confirmation of the oxazine ring system. Furthermore, the reaction of α-oxoketene intermediate **8** with phenols and amines furnished esters **4a,b** and amides **5a,b** derivatives in 46, 50% and 35, 40% yield respectively.

EXPERIMENTAL SECTION

All mps were determined on a Gallenkamp Melting point apparatus and are uncorrected. Infrared spectra were measured as KBr pellets on a Perkin-Elmer Model 298 spectrophotometer. ^{1}H NMR spectra were recorded on a Varian XL-200 spectrometer in $CDCl_3$ or DMSO-d_6 and TMS as an internal reference; chemical shifts are expressed as δ ppm. Analytical data were obtained on a C,H,N-Elemental Analyzer Carlo Erba 1106. Silica gel 60 (Merck, 230-400 mesh) was used for flash chromatography with chloroform:n-hexane (10:3) as eluent.

Synthesis of Furo[3,2-*c*]quinolones 3a,b.- A suspension of 3 mmol of powdered sodium salt of **1a,b**[10] was heated in dry toluene with 0.257 mL, 3 mmol of oxalyl chloride at 60°C for 2 h. The mixture was centrifuged to separate NaCl. Removal of the solvent under reduced pressure yielded a yellow residue which was recrystallized from dry acetonitrile to afford **3a,b** in 73% and 75% yield respectively.

5-Methyl-2,3,4,5-tetrahydrofuro[3,2-*c*]quinoline-2,3,4-trione (3a).- 73% yield, yellow crystals, mp. 138°C (dec.). IR (cm^{-1}): 2980 aliphatic (CH), 1835, 1780 and 1645 cm^{-1} for three (C=O). ^{1}H NMR ($CDCl_3$): δ 3.67 (s, 3H, CH_3) and 7.34-8.02 (m, 4H, aromatic-H). ^{13}C NMR ($CDCl_3$): δ 29.37 (NCH_3), 107.8, 112.32, 116.3, 116.9, 122.3, 122.9, 132.3, 137.8, 157.2, 161.4, 185.6 and 188.1.

3,4-Dihydro-2*H*-furo[3,2-*c*]coumarin-2,3,4-trione (3c).- A solution of the 4-hydroxycoumarin (16.2 g, 0.1 mol), oxalyl chloride (27.9 g, 0.22 mol) and 4-dimethylaminopyridine (0.5 g, 0.041 mol)[11] in chloroform (200 mL) was refluxed for 5 h. The solution was concentrated *in vacuo* and the residual oil was dissolved in 1,2-dichloroethane (70 mL), and added dropwise at room temperature into a suspension of aluminum chloride (0.3 mol) in 1,2-dichloroethane (100 mL). After 24 h, the reaction mixture was quenched with ice water (50 mL). The yellow oil was extracted with 1,2-dichloroethane, dried (molecular sieves 4°A) and concentrated *in vacuo*. The yellow residue was purified by flash chromatography using chloroform:*n*-hexane (10:3) as eluent to give 6.9 g. (32% yield) **3c** as pale yellow crystals, mp. 162°C (dec.). IR: 3040 aromatic (CH), 1825, 1750 and 1635 cm^{-1} for three (C=O). ^{1}H NMR ($CDCl_3$): δ 7.30-8.05 (m, 4H, aromatic-H).

^{13}C NMR ($CDCl_3$): δ 103.7, 114.4, 114.8, 122.3, 131.9, 154.4, 158.7, 161.9, 169.6, and 184.9.

Reaction of Furo[3,2-*c*]quinolone 3a with Phenols. General Procedure for 4a,b.- A mixture of 0.299 g. 1 mmol of furo[3,2-*c*]quinolone **3a** and 1 mmol of the corresponding phenols was heated at 70-75°C overnight. Upon cooling and treatment with ether, the product **4a,b** which separated as a white powder was collected and recrystallized from ethanol.

Phenyl 1-Methyl-2,4-dioxo-1,2,3,4-tetrahydro-3-quinolinecarboxylate (4a).- 35% yield, white powder, mp. 235°C. IR (cm^{-1}): 2980, 1745, 1675 and 1665 cm^{-1} for aliphatic (CH), ester and two (C=O) groups respectively. ^1H NMR (DMSO): δ 3.35 (s, 3H, NCH_3), 4.85 (s, 1H, CH), 7.10-8.25 (m, 9H, aromatic-H).
