

Synthesis of Linear 3-Phenylpyranocoumarins: Synthesis of Robustin, Robustic Acid, and their Methyl Ethers

By Vinod K. Ahluwalia,* Chandra Prakash, and Ravinder S. Jolly, Department of Chemistry, University of Delhi, Delhi, 110 007, India

The linear 3-phenylpyranocoumarins, viz., robustin (5b; $R^4 = H$), its methyl ether (5b; $R^4 = Me$), robustic acid (5c; $R^4 = H$), its methyl ether (5c; $R^4 = Me$), 4-methoxy-3-phenylxanthyletin (5a; $R^4 = H$), and its methyl ether (5a; $R^4 = Me$), have been synthesised starting from the corresponding 7-(1,1-dimethylprop-2-ynyloxy)-coumarin derivatives having the 8-position blocked with an easily introduceable and removable group like iodine. The subsequent step consists of heating the prop-2-ynyl ethers in *NN*-dimethylaniline, which resulted in cyclization to linear pyranocoumarins, accompanied by the removal of iodine and also partial demethylation of the methoxy-group at the 4-position. The compounds obtained were identical with the natural samples and were different from authentic samples of the corresponding angular isomers.

A NUMBER of 3-aryl-4-hydroxycoumarin derivatives having a C_5 unit either in the form of side-chain or as a 2,2-dimethylpyran ring, viz., robustic acid,¹⁻⁴ robustin,⁴ their methyl ethers,⁴ lonchocarpic acid,^{3,5-7} lonchocarpin,⁷ and scandenin,^{3,7} have been found to occur in nature. The few known syntheses of such systems⁸⁻¹² are multi-staged and give poor overall yields. Here we report a convenient route for the synthesis of such compounds.

Robustin (5b; $R^4 = H$), its methyl ether (5b; $R^4 = Me$), robustic acid (5c; $R^4 = H$), and its methyl ether (5c; $R^4 = Me$) were isolated from roots of *Derris robusta*.¹⁻⁴ Their structures were determined^{4,7,13,14} on the basis of spectral data, chemical degradations, and partial synthesis. Later, these structures were supported by their total synthesis.^{8,12}

Jain and Jain⁸ reported the first total synthesis of (5c; $R^4 = H$), starting from corresponding 5-C-prenyldeoxybenzoin which was cyclodehydrogenated with dichlorodicyanobenzoquinone and finally cyclized with ethyl chloroformate. The intermediate 5-C-prenyldeoxybenzoin was prepared in low yield by prenylation of 2,4-dihydroxy-6,4'-dimethoxydeoxybenzoin with 2-methylbut-3-en-2-ol in the presence of $BF_3 \cdot Et_2O$, which resulted in the formation of 3-C-, 5-C- and 3,5-di-C-prenyl compounds. Recently, Pathare and Shah¹² have reported the synthesis of (5b; $R^4 = Me$), (5c; $R^4 = H$), and (5c; $R^4 = Me$) starting from 5,7-dihydroxy-2,2-dimethylchroman, which was converted into the required deoxybenzoins in poor yield. The final step involved the dehydrogenation with *N*-bromosuccinimide-collidine.

Further, in the above methods the α -pyranone ring was built up on the pre-formed 2,2-dimethylbenzopyran nucleus. The synthesis, which involves the formation of a 2,2-dimethylpyran ring on a pre-formed benzopyranone nucleus and which may be closer to the biosynthetic process in plants, has not been reported so far. In fact, Jain and Jain¹⁵ failed in an attempted synthesis by the latter route, since prenylation of 4,5,7-trihydroxy-3-phenylcoumarins resulted in the formation of tri-C- and tetra-C-prenyl compounds.

It has been observed^{10,16,17} that the 7-(1,1-dimethyl-

prop-2-ynyl) ethers of coumarins, when heated in *NN*-dimethylaniline, result in the formation of angular pyranocoumarins, cyclization taking place at the more reactive 8-position. If the 8-position is substituted,^{9,10} however, the corresponding 8-substituted linear pyranocoumarins are obtained. In the present method the 8-position is blocked with iodine, a substituent easily introduced and removed. Thus, 7-hydroxy-8-iodocoumarins on prenylation with 3-chloro-3-methylbut-1-yne in acetone in the presence of potassium carbonate and potassium iodide, followed by heating in *NN*-dimethylaniline resulted in the formation of linear pyranocoumarins in quantitative yield, the iodine being removed during the thermal rearrangement.

The synthesis of 4-hydroxy-8,8-dimethyl-3-phenyl-2*H*,8*H*-benzo[1,2-*b*:5,4-*b'*]dipyran-2-one (4-hydroxy-3-phenylxanthyletin) (5a; $R^4 = H$) and its methyl ether (5a; $R^4 = Me$) was effected as a test case. Thus, 2,4-dihydroxydeoxybenzoin¹⁸ on iodination with iodine-periodic acid in alcohol gave 2,4-dihydroxy-3-iododeoxybenzoin (1a), which on treatment with ethyl chloroformate in acetone in the presence of potassium carbonate, followed by alkaline hydrolysis, yielded 4,7-dihydroxy-8-iodo-3-phenylcoumarin (2a). The dihydroxy-coumarin (2a) on partial methylation with 1.1 mol equiv. of dimethyl sulphate in acetone in the presence of sodium hydrogencarbonate gave 7-hydroxy-8-iodo-4-methoxy-3-phenylcoumarin (3a), which was also prepared by direct iodination of 7-hydroxy-4-methoxy-3-phenylcoumarin¹⁹ with iodine-periodic acid. Prenylation of the coumarin (3a) with 3-chloro-3-methylbut-1-yne gave 8-iodo-4-methoxy-3-phenyl-7-(1,1-dimethylprop-2-ynyloxy)coumarin (4a), which when heated in *NN*-dimethylaniline resulted in the formation of (5a; $R^4 = H$) and (5a; $R^4 = Me$), the former presumably being formed by the demethylation of the latter; the structures were supported by spectral results. ¹H N.m.r. spectral data of (5a; $R^4 = Me$) showed two singlets at δ 7.61 and δ 6.77 corresponding to 5-H and 10-H, indicating that the cyclization had taken place at the 6-position with elimination of iodine. Further, (5a; $R^4 = H$) and (5a; $R^4 = Me$) were different from authentic samples of the corresponding angular isomers, viz., 4-

hydroxy-8,8-dimethyl-3-phenyl-2*H*,8*H*-benzo[1,2-*b*:3,4-*b'*]dipyran-2-one (4-hydroxy-3-phenylsesselin) (8a; $R^4 = H$) and its methyl ether (8a; $R^4 = Me$), respectively, which were prepared by prenylation of 7-hydroxy-4-methoxy-3-phenylcoumarin¹⁹ with 3-chloro-3-methylbut-1-yne, followed by heating in *NN*-dimethylaniline of the 4-methoxy-3-phenyl-7-(1,1-dimethylprop-2-ynyl-oxy)coumarin (7a) formed. ¹H N.m.r. spectral data of (8a; $R^4 = Me$) showed the two doublets at δ 7.45 and

6.72 (*J* 10 Hz) corresponding to *o*-coupled 5-H and 6-H, respectively.

In a precisely analogous way, the natural products, robustin (5b; $R^4 = H$), its methyl ether (5b; $R^4 = Me$), robustic acid (5c; $R^4 = H$) and its methyl ether (5c; $R^4 = Me$) were prepared and were shown to be different from the corresponding angular isomers (8b; $R^4 = H$ and Me) and (8c; $R^4 = H$ and Me) (see Scheme).
