Keywords: Palladium / Platinum / N ligands / Tellurium / NMR spectroscopy

The reaction of py_2Te_2 or $(3-MeC_5H_3N)_2Te_2$ with Na_2PdCl_4 in methanol yields an insoluble brown complex, $[PdCl(TeNC_5H_3R)]_n$ (R = H or Me). Several reactions of $pyTe^-$, $(3-MeC_5H_3N)Te^-$, or $(6-MeC_5H_3N)Te^-$ with various palladium(II) and platinum(II) complexes have been carried out. Complexes of the types $[MCl(Te-N)(PR_3)]$, $[Pt(Te-N)_2(dppe)]$, $[Pt(Te-N)_2(PPh_3)_2]$, and $[Pt_2(\mu-Te-N)_2(dppe)_2][BPh_4]_2$ [M = Pd or Pt; Te-N = pyTe, (3- or $6-MeC_5H_3N)Te$] have been prepared and characterized by elemental analyses, UV/Vis, IR, and NMR (¹H, ³¹P, ¹⁹⁵Pt) spectroscopy. The complexes

Introduction

The synthesis and characterization of metal chalcogenolates continues to be an area of considerable interest. Their emerging applications as single-source precursors for a lowtemperature preparation of solid-state chalcogenide materials has further accelerated work in this area.^[1-4] The area of metal chalcogenolates has been dominated by molecules containing the M-SR linkage.^[5] In most cases, these molecules have been isolated as non-volatile insoluble (or sparingly soluble) polymers, thus making them inconvenient precursors for the preparation of metal chalcogenides. To suppress polymerization, several strategies have been explored. These include use of (a) a strongly coordinating ligand, such as tertiary phosphanes, [6,7] (b) a sterically demanding chalcogenolate ion,^[8] (c) internally functionalized small-bite ligands.^[9-13] One of the families of the latter class of ligands is the pyridine-2-chalcogenolate ion I. While the ligand chemistry of C5H4NO^{- [14]} and C5H4NS^{- [15]} has been well documented, the coordination chemistry of the pyridine-2-selenolate ion has been explored only re-

^[c] RSIC, Indian Institute of Technology, Chennai 600036, India $[MCl(Te-N)(PR_3)] \ show \ irreversible \ oxidation \ and \ reduction \ by \ CV \ in \ DMF. The molecular structure of [PdCl{Te(3-MeC_5H_3N)}(PPh_3)] (2c) \ has been established by single-crystal X-ray diffraction analysis. The palladium atom is bound to the chelating 3-methylpyridinetellurolate ligand, a chlorine atom and a PPh_3 ligand. The pyrolysis of [PdCl{Te(3-MeC_5H_3N)}(PR_3)] (PR_3 = PEt_3 \ or \ PPh_3) \ at 340 \ ^C \ yields \ PdTe.$

cently by us^[11,16] and others.^[17–21] In contrast, metal complexes with pyridine-2-tellurolate are virtually non-existent, although py_2Te_2 has been known for some time.^[22,23] Possibly, a rather tedious preparation ("difficult to reproduce"^[22]) of py_2Te_2 , the precursor for $C_5H_4NTe^-$, appears to be a limiting factor for its use as a ligand.

(E = O, S, Se, Te; R = H or Me)

Group-10 metal chalcogenides ($M_x E_y$; M = Pd or Pt; E = S, Se, Te) have found several applications in catalysis^[24] (PdTe supported on carbon is employed industrially) and in the electronic industry.^[25,26] Besides their wide structural diversity^[5] and relevance in catalysis,^[9,27,28] platinum-group metal chalcogenolates offer an attractive possibility of serving as precursors for the synthesis of metal chalcogenides.^[12,29] In continuation of our program on the molecular design of platinum-group metal precursors, we have now synthesized bis(2-pyridyl) and bis(methyl-substituted 2-pyridyl) ditelluride, and have investigated the chemistry of their palladium and platinum complexes.

Synthesis and NMR Spectroscopic Data

A methanolic solution of Na₂PdCl₄ was treated with py_2Te_2 or $(3-MeC_5H_3N)_2Te_2$ at room temperature to give a brown insoluble product, $[PdCl{Te(3-RC_5H_3N)}]_n [R = H$ (1a) or Me (1b)]. The IR spectrum of 1b exhibits a band at 281 cm⁻¹ which is assigned to the terminal v_{Pd-Cl} stretching. On treatment with tertiary phosphanes, the mononuclear complexes [MCl{Te(3-MeC₅H₃N)}(PR₃)] are obtained. The latter complexes and their platinum analogues can readily be prepared by the reaction of $[M_2Cl_2(\mu Cl_{2}(PR_{3})_{2}$ with 2 equiv. of NaTe($RC_{5}H_{3}N$) (R = H, 3-Me, or 6-Me) [(Scheme 1), prepared by the cleavage of the Te-Te bond in bis(2-pyridyl) ditelluride with NaBH₄ in methanol]. The reaction exclusively gives $[MCl{Te(RC_5H_3N)}(PR_3)]$ (2).

Similar reactions with pyO^- afford 2-pyridinolatebridged dinuclear complexes, $[M_2Cl_2(\mu-OC_5H_4N)_2-$

 $(M = Pd \text{ or } Pt; PR_3 = PEt_3, PnPr_3, PMe_2Ph, PMePh_2, PPh_3, Ptol_3, PPh_2py)$

Scheme 1

 $(PR_3)_2]$,^[30] while in the reactions with pyS^- , both monoand dinuclear complexes $[MCl(SC_5H_4N)(PR_3)]$ and $[M_2Cl_2(\mu$ -SC₅H₄N)₂(PR₃)₂] are formed, depending on the nature of the phosphane ligand.^[31-35] In solution a dimer \rightleftharpoons monomer equilibrium is established, which is shifted to either side by subtle energetic factors. The reactions with $C_5H_4NSe^-$ preferentially yield mononuclear complexes, $[MCl(SeC_5H_4N)(PR_3)]$. However, dinuclear species are formed in small concentration (ca. 5%) in certain cases when trialkylphosphanes are used.^[11] Clearly, as the Pd-E

FULL PAPER

distance (Pd-O ≈ 2.10 Å; Pd-S ≈ 2.28 Å; Pd-Se ≈ 2.45 Å; Pd-Te ≈ 2.55 Å) increases with increasing size of the chalcogen atom, the Pd-N interaction of these small-bite ligands with a single metal center is facilitated.

The reaction of PtCl₂(dppe) with 2 equiv. of NaTe(3-MeC₅H₃N) yields the yellow mononuclear complex [Pt{Te(3-MeC₅H₃N)}₂(dppe)]. The NMR spectroscopic data (¹H, ³¹P, and ¹⁹⁵Pt) are consistent with several organo-chalcogenolates, *cis*-[Pt(ER)₂(P-P)].^[6,7,11-13] The reaction, performed in a 1:1 ratio in the presence of NaBPh₄, gives a cationic complex [Pt₂{Te(3-MeC₅H₃N)}₂(dppe)₂][BPh₄]₂. The ³¹P and ¹⁹⁵Pt NMR spectra show two sets of resonances and doublets of doublets, respectively; a pattern which can be attributed to the non-equivalence of the phosphorus nuclei of the P–P ligand. Similar spectral features have been reported for [Pt₂(μ -SeCH₂CH₂NMe₂)₂(dppe)₂]²⁺ [¹³] for which the existence of an asymmetric M–Se bridge has been suggested.

Treatment of PtCl₂(PPh₃)₂ with 2 equiv. of NaTe(3-MeC₅H₃N) affords [Pt{Te(3-MeC₅H₃N)}₂(PPh₃)₂]. The ³¹P NMR spectrum of the complex exhibits a resonance at δ = 6.6 ppm, with ¹*J*(Pt-P) = 3725 Hz, together with a signal which is assigned to PPh₃ (δ = -4.5 ppm) (Table 1). A dynamic equilibrium between free PPh₃ and [M(EC₅H₄N)₂(PPh₃)] (M = Pd or Pt; E = S or Se)^[11,16] has been reported earlier.

The ¹H NMR spectra of **2** show characteristic resonances for the ligand protons. The 6-H proton signal for the (3-MeC₅H₃N)Te ligand in the platinum complexes is flanked by ¹⁹⁵Pt satellites with ³*J*(Pt-H) \approx 40 Hz. The ³¹P NMR spectra of these complexes display a single resonance indicating the formation of only one isomer. The magnitude of ¹*J*(¹⁹⁵Pt-³¹P) in the platinum complexes suggests that the phosphane ligand is *trans* to the nitrogen atom of the chelating 2-pyridinetellurolate ligands,^[11–13] and this is confirmed by the X-ray structural analysis. The ¹⁹⁵Pt NMR spectra (Table 2) show a doublet due to coupling with the single phosphorus nucleus. The ¹⁹⁵Pt resonance is considerably shielded relative to the signal for the corresponding 2pyridineselenolate complexes.^[11]

UV/Vis Spectroscopy

All these complexes are deeply colored crystalline solids. The UV/Vis spectra (Table 3) in dichloromethane show a well-separated relatively weak broad band in the visible region, and this is responsible for the deep colors observed for these complexes. The platinum complexes have an absorbance band at higher energies than that of the corresponding palladium analogues. For both the series of complexes (Pd or Pt), this band is hypsochromically shifted with increasing donor strength of the phosphane ligand. The DFT calculations of $[MCl(TeCH_2CH_2NMe_2)(PR_3)]$ (M = Pd or Pt) reveal a metal-mediated charge-transfer between coordinated ligands. The highest occupied molecular orbital (HOMO) is predominantly centered on the tellurolate ligand, whereas the lowest unoccupied molecular orbital (LUMO) is delocalized over the system, with significant phosphane contributions. The low-energy electronic transitions between the frontier orbitals give rise to the colors.^[35]

Cyclic Voltammetry

The complexes show irreversible oxidation and reduction in DMF/0.01 \mbox{M} Et₄NClO₄ (Table 4). The lower oxidation potential of the Pt/Te system indicates that the HOMO (Te) is destabilized relative to that of the corresponding Pd/Te system. Such behavior has been reported for [MCl(TeCH₂CH₂NMe₂)(PR₃)] complexes.^[35] It was difficult to oxidize the 2-pyridineselenolates [MCl-(SeC₅H₄N)(PR₃)] (high oxidation potential values).

TeCH₂CH₂NMe₂).^[12,13,35] The square plane of the palladium atom (defined by the N, Cl, P, Te atoms), the fourmembered chelate ring [Pd, N, C(5), Te], and the pyridine ring are almost coplanar, with the interplanar angles varying between 3.68 and 6.68°. The Te atom lies 0.1 Å out of the plane defined by the Pd, N, Cl, and P atoms.

The various angles around the Pd atom differ significantly from [PdCl(TeCH₂CH₂NMe₂)(PR₃)] (PR₃ = PnPr₃, PMePh₂),^[35] owing to the small bite of the four-membered (3-MeC₅H₃N)Te moiety. The Pd–Te distance is slightly longer [2.5606(8) Å] than that observed for [PdCl(TeCH₂CH₂NMe₂)(PR₃)] [PR₃ = PnPr₃ 2.5095(8) and PMePh₂ 2.5156(6) Å],^[35] while the Pd–N distance [2.085(4) Å] is shorter than that reported for [PdCl(TeCH₂CH₂N-Me₂)(PR₃)].^[35] These distances, as well as the Pd–Cl, Pd–P and Te–C bond lengths are not unusual.^[33–35,37–40]

Thermal Behavior

Thermogravimetric analysis of [PdCl{Te(3-MeC₅H₃N)} (PPh₃)] (**2c**) was carried out under a dynamic argon pressure. The TG curve shows a one-step decomposition (290°C), leading to the formation of PdTe as inferred from the calculated weight loss. In order to prepare large quantities of the telluride, a substantial amount (100–350 mg) of the complexes (**2a**, **2c**) was heated in a furnace at 340°C for 2 h under a dynamic dry argon pressure. The weight loss and XRD pattern (Figure 2) of the residue obtained after decomposition in each case matches the product obtained from TG. The XRD patterns (Figure 2) of all these samples are in agreement with the standard pattern of PdTe^[41] [analysis of the prepared PdTe: sample from **2a**: C 1.8, H < 0.2, N < 0.2; sample from **2c**: C < 0.2, H < 0.2, N < 0.2 (detection limit 0.2%)]. The scanning electron micrographs

Figure 3. SEM picture of PdTe obtained from $[PdCl\{Te(3-MeC_3H_3N)\}(PPh_3)]$

(Figure 3) of PdTe obtained from **2c** taken at different resolutions show large aggregates of microcrystals.

Experimental Section

General: The complexes Na2PdCl4, [PtCl2(PPh3)2], [M2Cl2(µ- $Cl_{2}(PR_{3})_{2}$] (M = Pd or Pt; PR₃ = PEt₃, PnPr₃, PMe₂Ph, PMePh₂, PPh₃), [PtCl₂(dppe)],^[42] py₂Te₂,^[43a] (3-/6-MeC₅H₃N)₂Te₂,^[43b] and the methyl-substituted 2-bromopyridines^[44] were prepared according to literature methods. The phosphanes were obtained from Strem Chemicals (USA). All reactions were carried out under nitrogen, in dry and distilled analytical grade solvents. Microanalyses were carried out in the Analytical Chemistry Division of B.A.R.C. $^1H,~^{31}P\{^1H\},~^{125}Te\{^1H\},$ and $^{195}Pt\{^1H\}$ NMR spectra were recorded with a Bruker DPX-300 NMR spectrometer, operating at 300, 121.49, 94.86, and 64.52 MHz, respectively. Chemical shifts are relative to the internal chloroform peak ($\delta = 7.26$ ppm) for ¹H, external 85% H₃PO₄ for ³¹P, Te(dtc)₂ (dtc = Et_2NCS_2) for ¹²⁵Te, and Na₂[PtCl₆] in D₂O for ¹⁹⁵Pt. A 90° pulse was used in every case. The IR spectra were recorded as Nujol mulls between CsI plates with a Bomen MB-102 FT-IR spectrometer. UV/Vis absorbance spectra were recorded with a JASCO V-530 spectrometer using quartz cuvettes with a diameter of 1 cm. Cyclic voltammetry was carried out at a scan rate of 100 $mV{\cdot}s^{-1}$ in DMF/0.01 $\mbox{\sc m}$ Et₄NClO₄, using a three-electrode configuration (glassy carbon electrode, platinum counter electrode, calomel reference electrode) and an Ecochemie potentiostat 100 with autolab software. The ferrocene/ferrocenium couple served as the external reference. Mass spectra were recorded with a VG-705 11-250J spectrometer at RSIC, Panjab University, Chandigarh. Thermogravimetric analysis (TGA) was carried out using a Setaram 92-16-18 instrument calibrated with CaC₂O₄·H₂O. The TG curves were recorded at a heating rate of 10 °C·min⁻¹ under a flow of argon. X-ray powder diffraction was measured using $Cu-K_a$ radiation. SEM photographs were taken using a JEOL JSM-T330A instrument.

Preparations

Preparation of Bis(3- and 6-methyl-2-pyridyl) Ditelluride: Sodium borohydride (4.0 g, 108 mmol) was added slowly under a flow of nitrogen to a suspension of tellurium powder (9.65 g, 76 mmol) in 2-ethoxyethanol. The resulting colorless solution was refluxed for 30 min and then cooled to room temperature; 3- or 6-methyl-substituted 2-bromopyridine (13.07 g, 76 mmol) was added and the resulting solution was refluxed until all the 2-bromopyridine was con-

sumed (48–96 h). The progress of the reaction was monitored by TLC. The nitrogen flow was stopped and the mixture was subjected to oxidation in air. The solvent was removed under vacuum and the crude residue was washed with water, and extracted with diethyl ether (4 \times 100 mL). The extract was dried with anhydrous sodium sulfate and the solvent removed using a rotary evaporator, leaving the crude ditelluride. This was purified by column chromatography (silica gel; hexane/ethyl acetate, 10:1).

Bis(3-methyl-2-pyridyl) Ditelluride {[(3-MeC₅H₃N)Te]₂}: Yield 52%, m.p. 125–128°C. C₁₂H₁₂N₂Te₂ (439.4): calcd. C 32.8, H 2.7, N 6.4; found C 32.6, H 2.42, N 6.18. UV/Vis (CH₂Cl₂): λ_{max} (ε) = 297 (3260), 346 (sh, 1340), 412 (510) nm. ¹H NMR (CDCl₃): δ = 2.41 (s, Me), 6.96 (dd, *J* = 3.2, 5.0 Hz, 5-H), 7.25 (d, *J* = 4.6 Hz, 4-H); 8.20 (dd, *J* = 0.8, 3.5 Hz, 6-H) ppm. ¹³C{¹H} NMR (CDCl₃): δ = 24.4 (s, Me), 122.1 (C-4), 134.9 (C-5), 137.8 (C-2), 140.7 (C-3), 148.3 (C-6) ppm. ¹²⁵Te{¹H} NMR (CDCl₃): δ = -382.7 ppm. IR (KBr): $\tilde{v} = 3060, 2960, 2920, 1580, 1540, 1430,$ 1120, 1090, 1020, 840, 780, 660, 540 cm⁻¹. MS (EI): *m/z* (%) = 440 (7.33) [M (¹³⁰Te)]⁺, 314 (14.51) [M - Te]⁺, 216 (1.47) [M -MeC₅H₃NTe], 183 (76.62) [M - Te₂H]⁺, 92 (100) [M -CH₃pyTe₂]⁺.

Bis(6-methyl-2-pyridyl) Ditelluride: Yield 24%, m.p. 55–56°C. C₁₂H₁₂N₂Te₂ (439.4): calcd. C 32.8, H 2.7, N 6.4; found C 32.21, H 2.52, N 6.18. UV/Vis (CH₂Cl₂): λ_{max} (ε) = 292 (sh, 8110), 386 (850) nm. ¹H NMR (CDCl₃): δ = 2.50 (s, Me), 6.85 (d, *J* = 5.0 Hz, 3-H), 7.25 (t, *J* = 5.0 Hz, 4-H), 7.84 (d, *J* = 5.0 Hz, 5-H) ppm. ¹³C{¹H} NMR (CDCl₃): δ = 24.2 (s, Me), 121.0 (C-4), 128.0 (C-5), 134.9 (C-2), 137.0 (C-3), 158.9 (C-6) ppm. ¹²⁵Te{¹H} NMR (CDCl₃): δ = -426.4 ppm. IR (KBr): $\tilde{\nu}$ = 3042, 2916, 1571, 1429, 1376, 1242, 1163, 1083, 988, 826, 781, 655, 545 cm⁻¹. MS (EI): *m/z* (%) = 444 (5.5) [M (¹³⁰Te)]⁺, 314 (6.5) [M - Te]⁺, 216 (0.6) [M - MeC₅H₃NTe], 183 (30.9) [M - Te₂H]⁺, 92 (100) [M -CH₃pyTe₂]⁺.

[PdCl{Te(3-MeC₅H₃N)}]_n (1b): A methanolic solution (10 mL) of Na₂PdCl₄ (342 mg, 1.16 mmol) was added to a methanolic solution (20 mL) of $(3-MeC_5H_3N)_2Te_2$ (256 mg, 0.58 mmol) while stirring at room temperature, whereupon a brown precipitate formed. Stirring was continued for 3 h. The brown precipitate was filtered, washed with methanol, water, acetone, and diethyl ether and dried in vacuo (yield: 235 mg, 56%). Complex 1a was also prepared in a similar manner.

[PdCl{Te(3-MeC₅H₃N)}(PEt₃)] (2a): An acetone suspension (20 mL) of $[Pd_2Cl_2(\mu-Cl)_2(PEt_3)_2]$ (108 mg, 0.18 mmol) was added to a freshly prepared methanolic solution (5 mL) of NaTe(3-MeC₅H₃N) [prepared from (3-MeC₅H₃N)₂Te₂ (82 mg, 0.19 mmol) and NaBH₄ (15 mg, 0.39 mmol)], and the mixture was stirred for 4 h at room temperature. The solvents were evaporated in vacuo and the residue was extracted with acetone (3 × 8 mL). The solution was passed through a Florisil column. The blue solution was concentrated to 3 mL, a few drops of hexane were added, and the solution was kept at -5° C in a freezer giving blue-violet crystals (130 mg, 74%). Similarly, other palladium (**2b**, **2c**, **2f**) and platinum (**3a**-**3d**) complexes were prepared. The most important data are summarized in Table 6.

[PdCl{Te(3-MeC₅H₃N)}(Ptol₃)] (2d): Solid Ptol₃ (tol = 4-MeC₆H₄) (26 mg, 0.09 mmol) was added to an acetone suspension (20 mL) of **1** (30 mg, 0.08 mmol), and the mixture was stirred for 1 h. The green solution was dried in vacuo and the residue was washed with hexane, diethyl ether and recrystallized from acetone/hexane to yield green crystals (38 mg, 68%). The complexes **2c** and **2e** were prepared in an analogous manner.

[Pt{Te(3-MeC₅H₃N)}₂(dppe)] (4a): This compound was prepared analogously to 2a by using [PtCl₂(dppe)] (110 mg, 0.17 mmol) and NaTe(3-MeC₅H₃N) [prepared from $(3-MeC_5H_3N)_2Te_2$ (73 mg, 0.17 mmol) and NaBH₄ (13 mg, 0.34 mmol)]. The yellow residue was recrystallized from a CH₂Cl₂/hexane mixture (yield: 109 mg, 64%). Complex 4b was prepared in a similar manner.

[Pt{Te(3-MeC₅H₃N)}₂(PPh₃)₂] (5): A benzene suspension of [PtCl₂(PPh₃)₂] (154 mg, 0.19 mmol) was added to a freshly prepared methanolic solution (5 mL) of NaTe(3-MeC₅H₃N) [prepared from $(3-MeC_5H_3N)_2Te_2$ (85 mg, 0.19 mmol) and NaBH₄ (15 mg, 0.39 mmol)], and the yellow-orange mixture was stirred for 4 h. The solvents were evaporated in vacuo and the residue was washed thoroughly with hexane, diethyl ether, and acetone and then extracted with benzene (3 × 8 mL). The solution was passed through a Florisil column and concentrated to 5 mL, a few drops of acetone were added, and the solution was kept at -5° C in a freezer, giving a yellow powder (95 mg, 42%).

[Pt₂{Te(3-MeC₅H₃N)}₂(dppe)₂][BPh₄]₂ (6): An acetone suspension (20 mL) of [PCl₂(dppe)] (203 mg, 0.31 mmol) was added to a freshly prepared methanolic solution (5 mL) of NaTe(3-MeC₅H₃N) [prepared from (3-MeC₅H₃N)₂Te₂ (68 mg, 0.16 mmol) and NaBH₄ (12 mg, 0.32 mmol)], while stirring. After 2 h, an acetone solution (8 mL) of NaBPh₄ (107 mg, 0.31 mmol) was added, while stirring was continued for 3 h. The solvents were evaporated under vacuum. The yellow residue was extracted with acetone (3 × 8 mL) and passed through a Florisil column. The solution was concentrated to 5 mL and yellow crystals were obtained (207 mg, 60%).

Crystallography: X-ray data on dark green crystals of [PdCl{Te(3-MeC₅H₃N)}(PPh₃)] (**2c**) were collected at room temperature with an Enraf–Nonius CAD-4 diffractometer using graphite-monochromated Mo- K_{α} radiation ($\lambda = 0.71073$ Å), employing the ω -20 scan technique. Crystal data are given in Table 7. The unit cell parameters were determined from 25 reflections measured by random search routine and indexed by the method of short vectors followed by least-squares refinement. The intensity data were corrected for Lorentz polarization and absorption effects. The structure was solved using the SHELXS86^[45] and refined using the SHELXL97^[46] computer programs. The non-hydrogen atoms were refined anisotropically. CCDC-181928 contains the supplementary crystallographic data for this paper. These data can be obtained
