Treatment of the phosphino-N-benzoyl hydrazones $PPh_2CH_2C(R)=NNHC(=O)Ph$ (R = Bu^t, I; R = Ph, II) with $[MCl_2(NCPh)_2]$ (M = Pd or Pt) gave complexes of type $[MCl_2(Ph_2CH_2C(Bu^t)=NN=C(Ph)O_2]$ (M = Pd, 1; M = Pt, 2) containing two fused five-membered chelate rings, Metathesis with LiBr or NaI gave [MX{PPh₂CH₂C(Bu^t)=NN= C(Ph)O (X = Br or I; M = Pd or Pt). The complex [PtMe{PPh₂CH₂C(Bu^t)=NN=C(Ph)O}] (8) was obtained by treating [PtMe₂(cod)] (cod = cycloocta-1,5-diene) with one equivalent of I in hot benzene. Treatment of [PtMe₂(cod)] with two equivalents of the phosphine II gave [PtMe{PPh₂CH₂C(Ph)=NNC(=O)Ph}{PPh₂CH₂C(Ph)=NNHC(=O)-Ph] (11), containing a six-membered chelate ring and a unidentate coordinated ligand II. Treatment of [PtCl₂(NCMe)₂] with two equivalents of II in the presence of triethylamine gave [Pt{PPh₂CH=C(Ph)N–N=C(Ph)O}-{PPh,CH,C(Ph)=NNHC(=O)Ph] (12), containing a terdentate (P,N,O-bonded) doubly deprotonated ene-hydrazone ligand and a unidentate ligand II. Prolonged treatment of [PdCl₃(NCPh)₃] with two equivalents of I in the presence of triethylamine gave [Pd{PPh₂CH=C(Bu^t)NHNC(=O)Ph₂] (13), containing two chelated phosphino ene-hydrazide ligands forming six-membered rings. A similar platinum complex, [Pt{PPh₂CH=C(Bu^t)NHNC(=O)Ph}₂](14), was synthesised. The terdentate complexes of $[MX{PPh_2CH_2C(Bu^t)=NN=C(Ph)O}]$ (M = Pd, Pt; X = Cl, Me) underwent base-promoted (NEt₃) Michael-type reactions with MeO₂CC=CCO₂Me to give terdentate complexes of the type $[MX{PPh_2CH[C(CO_2Me)=CH(CO_2Me)]C(Bu')=NN=C(Ph)O}] (M = Pd, Pt; X = Cl, Me).$ The corresponding bromides and iodides were made by metathesis. The crystal structures of 1, 12 and 13 have been determined.

In a previous paper, we showed that a new type of phosphine ligand, a phosphino-N-benzoyl hydrazone, PPh₂CH₂C(Bu^t)= NNHC(=O)Ph (I), generated novel chemistry with rhodium(I) and rhodium(III) carbonyls.¹ In these rhodium complexes, the monodeprotonated phosphino-N-benzoyl hydrazone, PPh2-CH₂C(Bu^t)=NN=C(Ph)O⁻, acted as a terdentate ligand and was coordinated through P, N and O, giving two fused 5-membered chelate rings. Of the three donor atoms, one would expect phosphorus to be bonded the strongest to a metal such as rhodium, the amide oxygen to be the weakest bonded and an azinetype nitrogen to be somewhere between the two in its donor ability. One might also expect that such a phosphino N-benzoyl hydrazone might be induced to show terdentate (P,N,Obonded), bidentate (P,N-bonded) and unidentate (P-bonded) bonding modes. We have now investigated the phosphino-Nbenzoyl hydrazones, PPh₂CH₂C(R)=NNHC(=O)Ph (R = Bu^t or Ph) as ligands towards palladium and platinum and find that examples of terdentate (P,N,O) and bidentate (P,N) coordination are formed from the deprotonated phosphino-N-benzoyl hydrazone, and unidentate (P) coordination can occur from the undeprotonated form; 5- and 6-membered chelate rings have been obtained.

Results and discussion

The new ligand Z-PPh₂CH₂C(Ph)=NNHC(=O)Ph (II) was prepared by treating the keto-phosphine PPh₂CH₂C(=O)Ph with benzohydrazide in hot ethanol using acetic acid as catalyst. Preparative details are in the Experimental, along with characterising microanalytical, mass spectral and NMR data. We first investigated the coordinating ability of the deprotonated phosphino hydrazones PPh₂CH₂C(Bu^t)=NN=C(Ph)O⁻ and PPh₂CH₂C(Ph)=NN=C(Ph)O⁻ as terdentate ligands with palladium(II) and platinum(II); see Scheme 1. Where appropriate, for some of the syntheses described in this paper, we used ³¹P-{¹H} NMR spectrocopy, with an external lock, to follow the progress of reactions in the reaction mixture.

Treatment of the phosphine I with one equivalent of $[PdCl_2(NCPh)_2]$ in dichloromethane gave the chelate complex $[PdCl_2(PPh_2CH_2C(Bu^t)=NN=C(Ph)O\}]$ (1) in 83% yield. This was characterised by elemental analysis, mass spectrometry and NMR spectroscopy, see Experimental. The infrared spectrum showed a band at 330 cm⁻¹ due to ν (Pd–Cl). From the NMR data for 1, we draw particular attention to the following—the ³¹P-{¹H} NMR spectrum of complex 1 showed a singlet resonance at 32.2 ppm. The ¹H NMR spectrum of 1 showed a resonance due to the CH₂P protons as a doublet at 3.97 ppm, ²*J*(PH) = 11.8 Hz. In the ¹³C-{¹H} NMR spectrum, the carbon-13 chemical shift of 47.1 ppm is typical of a methylene carbon

Scheme 1 (i) $[MCl_2(NCPh)_2]$ (M = Pd or Pt); (ii) LiBr or NaI; MeMgI for 9; (iii) $[PtMe_2(cod)]$; (iv) PPh₃.

Fig. 1 Crystallographically determined molecular structure for $[PdCl{PPh_2CH_2C(Bu^b)=NN=C(Ph)O}]$ (1) drawn with 40% probability ellipsoids and with hydrogen atoms shown as circles of arbitrary radius.

attached to phosphorus in a five-membered chelate ring.¹⁻⁴ We also determined the crystal structure of the palladium complex 1 (Fig. 1); selected bond lengths and angles are given in Table 1. The structure shows that the mono-deprotonated phosphino-*N*-hydrazone PPh₂CH₂C(Bu^t)=NN=C(Ph)O⁻ is terdentate (P,N,O-bonded) to palladium. The ligand atoms P, N, O and Cl are planar and there is nothing unusual in the bond lengths and angles. In the P(1)–C(6)–C(5)–N(4)–Pd ring, one hydrogen of the CH₂ group is pseudo-equatorial and the other pseudo-axial.

The corresponding chloroplatinum(II) complex [PtCl{PPh₂-CH₂C(Bu^t)=NN=C(Ph)O}] (2) was prepared by treating the phosphine I with one equivalent of $[PtCl_2(NCPh)_2]$. The ³¹P-{¹H} NMR spectrum of 2 showed a singlet at -0.1 ppm with satellites, ¹J(PtP) = 3992 Hz. The large coupling is in agreement with phosphorus being *trans* to an electronegative (oxygen donor) ligand.^{5,6}

The chloropalladium(II) complex $[PdCl{PPh_2CH_2C(Ph)=NN=C(Ph)O}]$ (3) was similarly prepared by treating the phos-

phine ligand II with one equivalent of $[PdCl_2(NCPh)_2]$. The ³¹P-{¹H} NMR spectrum of **3** showed a singlet at 35.1 ppm and the infrared spectrum a band at 330 cm⁻¹ due to v(Pd-Cl). In the ¹H NMR spectrum, the methylene protons (PCH₂) gave a broad resonance at 4.22 ppm. We were able to convert these chloropalladium(II), **1**, and chloroplatinum(II), **2**, complexes into the corresponding bromo or iodo complexes by metathesis. Treatment of the chloropalladium(II) complex **1** with an excess of lithium bromide in acetone gave the corresponding bromide **4**, or with sodium iodide in acetone, the corresponding iodide **5**. The bromoplatinum(II) complex **6** and iodoplatinum(II) complex **7** were prepared similarly. Characterisation data for these four complexes are given in the Experimental.

We synthesised the methylplatinum(II) complex [PtMe{PPh2- $CH_2C(Bu^t)=NN=C(Ph)O\}$ (8) by treating $[PtMe_2(cod)]^7$ with one equivalent of the phosphine I in hot benzene. The ${}^{31}P-{}^{1}H$ NMR spectrum of 8 showed a singlet at 4.5 ppm with satellites, ${}^{1}J(\text{PtP}) = 4493$ Hz; this extremely large J value is characteristic of phosphorus trans to a highly electronegative (oxygen donor) and cis to a weakly electronegative (methyl) ligand.⁶ We attempted to prepare the corresponding methylpalladium(II) complex [PdMe{PPh₂CH₂C(Bu^t)=NN=C(Ph)O}] (9) by treating the chloropalladium(II) complex 1 with an excess of MeMgI, but we were unable to obtain the required product in an analytically pure form. However, the ³¹P-{¹H} NMR spectrum of the crude product showed a singlet at 33.4 ppm and the ¹H NMR spectrum showed two doublet resonances: one at 3.79 ppm ${^2J(PH) = 11.0 \text{ Hz}}$ due to PCH₂, the other at 0.84 ppm with ${}^{3}J(PH) = 1.1$ Hz, due to PdCH₃, *i.e.* much of the required product 9 had probably been formed.

We found that a chloride ion was easily displaced from the chloropalladium(II) complex 1 by PPh₃, so that treatment of 1 with PPh₃ gave the cation $[Pd(PPh_3){PPh_2CH_2C(Bu^t)=NN=C(Ph)O}]^+$, which we isolated as the BPh₄⁻ salt 10. The ³¹P-{¹H} NMR spectrum of 10 showed an AB pattern with ²*J*(PP) = 26 Hz; this small value for ²*J*(PP) shows that the phosphorus nuclei are mutually *cis*. In the ¹H NMR spectrum the resonance of the CH₂P protons was a double doublet at 3.89 ppm {²*J*(PH) = 11.8, ⁴*J*(PH) = 1.4 Hz}.

We studied the reaction of [PtMe₂(cod)] with two equivalents of the phosphine **II** in benzene. This gave [PtMe{PPh₂CH₂-C(Ph)=NNC(=O)Ph}{PPh₂CH₂C(Ph)=NNHC(=O)Ph] (**11**) (see Scheme 2). This methylplatinum(II) complex contained a bidentate six-membered chelate ring formed from the deprotonated ligand and a unidentate phosphino-*N*-hydrazone ligand. The ³¹P-{¹H}NMR spectrum of **11** at 36.2 MHz showed an AB pattern with satellites; $\delta P_A = 22.4$, ¹*J*(PtP) = 2898 Hz; $\delta P_B = 52.2$, ¹*J*(PtP) = 3098 Hz, with ²*J*(P_AP_B) = 472 Hz. The large value of ²*J*(P_AP_B) shows that the P atoms are mutually *trans*. In the ¹H NMR spectrum of **11**, the methylene protons in the chelate ring gave a broad resonance at 3.92 ppm. The resonance of the methylene protons in the unidentate phosphine was a doublet at

Scheme 2 (i) [PtMe₂(cod)]; (ii) [PtCl₂(NCMe)₂]; (iii) 0.5 equiv. $[MCl_2(NCPh)_2]$ (M = Pd or Pt).

4.92 ppm, ²*J*(PH) = 14.7 Hz with satellites, ³*J*(PtH) = 29.3 Hz. The methyl protons of the methylplatinum group gave a triplet resonance at 0.16 ppm, ³*J*(PH) = 7.3 Hz with satellites, ²*J*(PtH) = 70.9 Hz. The NH proton gave a broad resonance at 9.46 ppm. In the ¹³C-{¹H} NMR spectrum, the PtMe carbon resonated as a triplet at -19.4 ppm, ²*J*(PC) = 6.7 Hz, with satellites, ¹*J*(PtC) = 576 Hz.

In view of this interesting result from treating [PtMe₂(cod)] with two equivalents of II, we treated [PtCl2(NCMe)2] with two molar equivalents of the phosphino-N-hydrazone II in dichloromethane in the presence of an excess of Et₃N (without Et₃N the results were complicated). The result of treatment at 40 °C for a short time (10 min) gave [Pt{PPh₂CH=C(Ph)NN=C(Ph)O}-{PPh₂CH₂C(Ph)=NNHC(=O)Ph] (12), containing a (P,N,O) terdentate ligand derived from II via loss of two protons (*i.e.* one NH proton and one methylene proton). The ${}^{31}P{-}{{}^{1}H}$ NMR spectrum of 12 at 36.2 MHz showed an AB pattern with satellites, δP_{A} 3.4, ${}^{1}J(PtP) = 3108$ Hz for phosphorus *trans* to nitrogen and $\delta P_{\rm B} 8.0$, ¹J(PtP) = 3557 Hz for phosphorus *trans* to an oxygen donor ligand. The value ${}^{2}J(PP) = 14$ Hz shows that the two phosphorus donor atoms are *cis* to each other. The infrared spectrum showed a band at 3460 cm⁻¹ due to v(N-H). In the ¹H NMR spectrum, both the CH₂P protons, at 3.93 ppm, and the =CHP proton, at 4.81 ppm, gave doublet resonances with satellites ${}^{2}J(PH) = 10.0, {}^{3}J(PtH) = 38.3 \text{ and } {}^{2}J(PH) = 10.5,$ $^{3}J(PtH) = 18.9 Hz$, respectively}.

The crystal structure of complex **12** is shown in Fig. 2, with selected bond lengths and angles in Table 2. The four atoms coordinated to platinum are essentially coplanar. One of the phosphino hydrazone ligands **II** is doubly deprotonated and coordinated in a terdentate manner, through phosphorus, nitrogen and oxygen, giving two adjacent five-membered chelate rings. The undeprotonated phosphine ligand **II** is coordinated in a unidentate fashion through phosphorus. The C=C double bond length C(2)-C(3) is 1.374(4) Å, which is considerably shorter than the corresponding C–C single bond [C(7)-C(8) 1.509(4) Å] in the monodentate ligand.

We treated $[PdCl_2(NCPh)_2]$ with two equivalents of the phosphino-*N*-hydrazone I in dichloromethane in the presence of triethylamine for 3 h and obtained the deprotonated bis-(chelate)palladium(II) complex $[Pd{PPh_2CH=C(Bu^t)NHNC-(=O)Ph}_2]$ (13), containing two six-membered chelate rings (Scheme 2). The ³¹P-{¹H} NMR spectrum of 13 showed a singlet at 5.2 ppm. In the ¹H NMR spectrum, the resonance of the NH proton at 8.63 ppm was broad and was lost immediately on

Fig. 2 Crystallographically determined molecular structure for [Pt-{PPh₂CH=C(Ph)NN=C(Ph)O} {PPh₂CH₂C(Ph)=NNHC(=O)Ph}] (12) drawn with 40% probability ellipsoids and with hydrogen atoms shown as circles of arbitrary radius.

contact of the CD₂Cl₂ solution with D₂O. The resonance of the =CHP proton was a doublet of doublets at 3.68 ppm, with coupling to both phosphorus and the NH proton. In the ¹H- $\{^{31}P\}$ NMR spectrum of **13**, the =CHP proton gave a doublet resonance, ⁴*J*(HH) = 1.3 Hz. In the presence of D₂O, the resonance of the =CHP proton in the ¹H- $\{^{31}P\}$ NMR spectrum of **13** collapsed to a singlet and, in the ¹H NMR spectrum, a doublet with ²*J*(PH) = 2.0 Hz. In the ¹³C- $\{^{11}H\}$ NMR spectrum, the =CHP carbon gave a doublet resonance at 62.3 ppm, ¹*J*(PC) = 73.6 Hz.

We determined the crystal structure of the bis(chelate)palladium(II) complex 13 and this is shown in Fig. 3, with selected

Fig. 3 Crystallographically determined molecular structure for $[Pd-{PPh_2CH=C(Bu^t)NHNC(=O)Ph_2]}$ (13) drawn with 40% probability ellipsoids and with hydrogen atoms shown as circles of arbitrary radius.

bond lengths and angles in Table 3. It shows that the palladium is coordinated by two six-membered chelate rings formed from the hydrazone ligand I, with mono-deprotonation of a methylene group to give two C=CHP moieties with C(2)–C(3) 1.364(4) and C(8)–C(9) 1.365(4) Å. The two equivalent sixmembered rings are puckered. There is essentially planar coordination around the palladium, with the phosphorus atoms mutually *cis*.

The corresponding platinum and palladium complexes $[Pt{PP_2CH=C(Bu')NHNC(=O)Ph}_2]$ (14), $[Pd{PPh_2CH=C(Ph)NHNC(=O)Ph}_2]$ (15) and $[Pt{PPh_2CH=C(Ph)NHNC(=O)-Ph}_2]$ (16) were prepared by treating platinum or palladium sources { $[PtCl_2(cod)]$ or $[PdCl_2(NCPh)_2]$ } with two equivalents of phosphines I or II in the presence of NEt₃ for several hours. The NMR data for 14, 15 and 16 indicate that they have *cis*-bis

chelate structures analogous to that of 13. The ³¹P-{¹H} NMR spectrum of 14 showed a singlet at -17.1 ppm with satellites, ${}^{1}J(PtP) = 3274$ Hz. This intermediate value is consistent with phosphorus trans to nitrogen.8,9

In our previous study of the products formed by PPh₂CH₂C(Bu^t)=NNHC(=O)Ph (I) on rhodium,¹ we showed that MeO₂CC=CCO₂Me (dmad) reacted with the activated CH₂ adjacent to the coordinated phosphorus to give Michael-type addition. We have now studied the action of dmad on the complexes of type 1 and 2. The various reactions are summarized in Scheme 3.

When we treated the chloroplatinum(II) complex [PtCl- $\{PPh_2CH_2C(Bu^t)=NN=C(Ph)O\}$ (2) with an excess of dmad in the presence of triethylamine, it caused a base-promoted Michael-type addition to the backbone of 2, to give the product [PtCl{PPh₂CH[C(CO₂Me)=CH(CO₂Me)]C(Bu^t)=NN=C-(Ph)O}] (17). The isolated solid product 17 was characterized by NMR spectroscopy, including assignments made based on a two-dimensional COSY experiment, infrared, mass spectrometry, elemental analysis (C, H, N) and a molecular weight determination (see Experimental). The ³¹P-{¹H} NMR spectrum of 17 showed a singlet at 21.3 ppm with satellites, ${}^{1}J(PtP)$

= 4089 Hz, a high value is consistent with phosphorus *trans* to an oxygen donor ligand.^{5,6} In the ¹H NMR spectrum of **17**, the methylene CHP proton gave a doublet resonance at 5.56 ppm, $^{2}J(PH) = 13.6$ Hz with satellites, $^{3}J(PtH) = 38.4$ Hz. The resonance of the C=CH(CO₂Me) alkenyl proton was a doublet at 6.58 ppm, ${}^{4}J(PH) = 4.3$ Hz. The CO₂Me protons resonated at 3.22 and 3.68 ppm as singlets. A two-dimensional ¹H-¹³C-{¹H}COSY experiment showed that there was a correlation between the proton at 5.56 ppm to the carbon at 57.5 ppm (i.e. a CHP moiety) and a correlation between the proton at 6.58 ppm and the carbon resonating at 131.2 ppm, *i.e.* a = $CH(CO_2Me)$ moiety. In the ¹³C-{¹H} NMR spectrum of 17, the two singlets at 52.3 and 52.8 ppm were assigned to the resonances for the OMe carbons. Two signals at 173.1 and 180.6 ppm were due to the resonances for the CO_2Me carbons. The infrared spectrum of 17 showed bands at 345m and 1730s cm⁻¹, due to v(Pt–Cl) and v(C=O), respectively. In the mass spectrum of 17, we observed the parent ion peak at 775 ($[M + 1]^+$) and a peak at 738 corresponding to the loss of a HCl molecule ($[M - HCl]^+$). The elemental analytical data are in agreement with the composition C₃₁H₃₃ClN₂O₅PPt, as required for the proposed structure of the chloroplatinum(II) complex 17. The molecular

Scheme 3 (i) MeO₂CC=CCO₂Me; (ii) LiBr or NaI; (iii) Br₂.

weight determination (osmometric) in chloroform solution for **17** gave a value of 767 Daltons, in satisfactory agreement with the molecular formula $C_{31}H_{33}CIN_2O_5PPt$ (774 Daltons).

The analogous palladium(II) complex **18** was prepared similarly by treatment of **1** with an excess of dmad in the presence of NEt₃. The ³¹P-{¹H} NMR spectrum of **18** showed a singlet at 52.1 ppm. Mass spectral, infrared and NMR spectroscopic data were analogous to those of the chloroplatinum(II) complex **17**. We thus think that this complex has the analogous structure **18**.

The platinum(II) complex 17 was stable in solution; possibly substitution of one of the methylene hydrogens in 1 by $C(CO_2Me)=CH(CO_2Me)$ caused the chelation to platinum to be stronger (an extension of the Thorpe–Ingold effect). We thus thought it might be possible to effect replacement of the chloride by bromide without causing further change. We found this to be so. Thus, treatment of 17 with an excess of lithium bromide in acetone solution gave the corresponding bromide 19 in satisfactory (57%) yield. This complex was characterised by elemental analysis, mass spectrometry, IR spectroscopy and NMR spectroscopy (see Experimental). We similarly prepared the corresponding iodo-complex 20, and also the bromopalladium (21) and iodopalladium (22) complexes.

Treatment of the methylplatinum(II) complex [PtMe{PPh₂-CH₂C(Bu^t)=NN=C(Ph)O}] (8) with an excess of dmad in the presence of Et₃N similarly induced Michael addition and gave the methylplatinum(II) complex [PtMe{PPh₂CH[C(CO₂Me)= CH(CO₂Me)]C(Bu^t)=NN=C(Ph)O}] 23. This complex has similar NMR charateristics to those of the chloroplatinum(II) complex 17 with, additionally, a PtMe doublet resonance at 0.79 ppm, ³*J*(PH) = 1.3 Hz with satellites, ²*J*(PtH) = 71.6 Hz in the ¹H NMR spectrum.

When we treated the chloroplatinum(II) complex [PtCl-{PPh₂CH[C(CO₂Me)=CH(CO₂Me)]C(Bu^t)=NN=C(Ph)O}] (17) with an excess of bromine solution in CCl₄, a single platinum(IV) adduct, [PtClBr₂{PPh₂CH[C(CO₂Me)=CH(CO₂Me)]-C(Bu^t)=NN=C(Ph)O}] (24), was isolated as an orange solid and characterized. The ³¹P-{¹H} NMR spectrum of 24 showed a singlet at 12.6 ppm with satellites ${}^{1}J(PtP) = 2504$ Hz, which is consistent with the change of the oxidation state of the platinum from divalent to tetravalent.¹⁰ In the ¹H NMR spectrum of **24**, the CHP proton gave a doublet resonance at 6.64 ppm, ${}^{2}J(PH) = 14.4$ Hz with satellites, ${}^{3}J(PtH) = 10.2$ Hz. The resonance for the C=CH(CO₂Me) proton could not be assigned since it was obscured by the resonances of the phenyl protons. It is likely that in the octahedral platinum(IV) complex **24**, the two bromine atoms have added mutually *trans* to the platinum.¹¹ There was no reaction when we treated the chloropalladium(II) complex **18** with bromine solution.

In our previous work¹ on the adducts of MeO₂CC=CCO₂-Me (dmad) to the rhodium carbonyl complex [Rh(CO)-{PPh₂CH₂C(Bu^t)=NN=C(Ph)O}], in which the deprotonated $PPh_2CH_2C(Bu^t)=N-N=C(Ph)^-$ ligand was terdentate, *i.e.* P,N,Obound, two dmad molecules added. One gave a 5-membered metallacycle ring PPh2CH[C(CO2Me)=CH(CO2Me)]Rh, in which the C(CO₂Me)=CH(CO₂Me) moiety had both CO₂Me groups *cis* on the C=C bond. The second MeO₂CC=CCO₂Me gave rise to a terminal RhC(CO₂Me)=CH(CO₂Me) in which (again) both CO₂Me groups were cis on C=C. These cis orientations probably arose because reactions occured within the coordination sphere of the rhodium. However, the formation of 17 by attack by one acetylene carbon of dmad on the methine carbon formed by deprotonation of 1 might be followed by exo-protonation of the second (acetylenic) carbon, giving PtC(CO₂Me)=CH(CO₂Me) in which the CO₂Me groups would be mutually trans with respect to C=C. This might also be the case for 18. There are examples of olefins or acetylenes reacting within the coordination sphere of platinum(II) {or palladium(II)}, but there are also examples of *exo*-attack on unsaturated ligands attached to platinum(II) {or palladium(II)}, e.g. *exo*-attack by MeO⁻ on $[MCl_2(cod)]$ (M = Pt or Pd),¹² vinyl ester exchange (palladium)¹³ or attack by nucleophiles on coordinated allylic groups, e.g. with cations of the type [Pd(diphosphine)(allyl)]⁺.¹⁴ Thus, we have not specified the geometry around C(CO₂Me)=CH(CO₂Me) in complexes 17-24; only one geometric isomer is formed but we do not know whether it is cis or trans across C=C.

Experimental

All the reactions were carried out in an atmosphere of dry nitrogen. NMR spectra were recorded using a JEOL FX-90Q spectrometer (operating frequencies for ¹H and ³¹P of 89.5 and 36.2 MHz, respectively), a JEOL FX-100 spectometer (operating frequencies for ¹H and ³¹P were 99.5 and 40.25 MHz, respectively), or a Bruker AM-400 spectrometer (operating frequencies for ¹H, ³¹P and ¹³C were 400.13, 161.9 and 100.6 MHz, respectively). ¹H and ¹³C chemical shifts are in ppm relative to tetramethylsilane and for ³¹P are relative to 85% phosphoric acid, coupling constants are in Hz. In the proton NMR spectra, the resonances due to phenyl protons appeared between 7.0 to 7.9 ppm. Infrared spectra were recorded using a Perkin-Elmer model 257 grating spectrometer (4000–600 cm⁻¹) or a Pye Unicam SP 2000 (4000-200 cm⁻¹). EI and FAB mass spectra were recorded using a VG Autospec spectrometer with 8 kV acceleration. Molecular weights were determined on a Hitachi-Perkin Elmer model 115 apparatus in chloroform at 30 °C.

Syntheses

Z-PPh₂CH₂C(Bu^t)=NNHC(=O)Ph (I) was prepared according to our literature procedure.¹

Z-PPh₂CH₂C(Ph)=NNHC(=O)Ph (II). A solution of the keto-phosphine Z-PPh₂CH₂C(=O)Ph (4.4 g, 10.4 mmol), benzo-hydrazide (6.4 g, 47.0 mmol) and acetic acid (10 cm³) in ethanol (60 cm³) was heated under reflux for 12 h. This gave the required

phosphine **II** as a white crystalline solid. Yield 3.0 g, 68%. Found: C, 76.0; H, 5.35; N, 6.65; $C_{27}H_{23}N_2OP$ requires C, 76.75; H, 5.5; N, 6.65%. MS (EI) *m*/*z*: 422 (M⁺). IR (cm⁻¹): *v*(N–H) = 3360m and *v*(C=O) = 1675s. ³¹P-{¹H} NMR (36.2 MHz, CDCl₃), δ_P (ppm): -21.8 (s). ¹H NMR (100 MHz, CDCl₃), δ_H (ppm): 3.58 (2H, s, CH₂) and 9.23 (1H, br, NH, exchanges with D₂O).

[PdCl{PPh₂CH₂C(Bu')=NN=C(Ph)O}] (1). A solution containing I (1.1 g, 2.9 mmol) and $[PdCl_2(NCPh)_2]$ (990 mg 0.26 mmol) in dichloromethane (20 cm³) was put aside for 24 h. The solvent was then evaporated to low volume under reduced pressure and methanol added to the residue to give 1 as a yellow solid. Yield 1.32 g, 83%. An analytical sample was crystallised from CH₂Cl₂–MeOH. Found: C, 54.7; H, 4.7; N, 5.1; C₂₅H₂₆ClN₂OPPd·0.1CH₂Cl₂ requires C, 54.6; H, 4.8; N, 5.05%. MS (FAB) *m*/*z*: 543 ([M + 1]⁺) and 507 (M–Cl). IR (cm⁻¹): *v*(Pd–Cl) = 330m. ³¹P-{¹H} NMR (36.2 MHz, CDCl₃), *δ*_P (ppm): 32.2 (s). ¹H NMR (100 MHz, CDCl₃), *δ*_H (ppm): 1.51 (9H, s, Bu'), 3.97 [2H, d, ²J(PH)11.8, CH₂]. ¹³C-{¹H} NMR (100.6 MHz, CDCl₃) *δ*_C: 28.6 (3C, s, *CMe*₃), 38.3 (1C, d, ³J(PC) 10.7, *CMe*₃), 47.1 [1C, d, ¹J(PC) 32.6, CH₂P], 173.2 (1C, s, C=N) and 177.4 (1C, s, C=N).

[PtCl{PPh₂CH₂C(Bu¹)=NN=C(Ph)O}] (2). A solution containing the phosphine I (760 mg, 1.9 mmol) and [PtCl₂(NCPh)₂] (890 mg 1.9 mmol) in sadichloromethane (20 cm³) was put aside for 24 h. The solvent was then evaporated to low volume under reduced pressure and methanol added to the residue to give **2** as a yellow solid. Yield 690 mg, 65%. A sample was recrystallised from CH₂Cl₂–MeOH. Found: C, 44.0; H, 3.5; N, 4.75; C₂₅H₂₆ClN₂OPPt·0.8CH₂Cl₂ requires C, 44.3; H, 4.0; N, 4.0%. MS (FAB) *m/z*: 632 ([M + 1]⁺) and 596 (M – Cl). IR (cm⁻¹): v(Pt-Cl) = 325m. ³¹P-{¹H} NMR (36.2 MHz, CDCl₃), δ_P (ppm): -0.14 (s), ¹J(PtP) = 3992. ¹H NMR (100 MHz, CDCl₃), δ_H (ppm): 1.53 (9H, s, Bu^t) and 3.79 [2H, d, ²J(PH) 11.3, ³J(PtH) 10.2, CH₂].

[PdCl{PPh₂CH₂C(Ph)=NN=C(Ph)O}] (3). A solution containing the phosphine **II** (156 mg, 0.37 mmol) and [Pd-Cl₂(NCPh)₂] (141 mg 0.36 mmol) in dichloromethane (10 cm³) was put aside for 30 min. The solvent was then evaporated to low volume under reduced pressure and methanol added to the residue to give **3** as a yellow solid. Yield 110 mg, 53%. Found: C, 57.4; H, 3.8; N, 5.7; C₂₇H₂₂ClN₂OPPd requires C, 57.5; H, 4.1; N, 5.0%. MS (FAB) *mlz*: 563 ([M + 1]⁺) and 527 (M – Cl). IR (cm⁻¹): ν (Pd–Cl) = 330m. ³¹P-{¹H} NMR (36.2 MHz, CDCl₃), $\delta_{\rm P}$ (ppm): 35.1(s). ¹H NMR (100 MHz, CDCl₃), $\delta_{\rm H}$ (ppm): 4.22 (2H, br, CH₂).

[PdBr{PPh₂CH₂C(Bu')=NN=C(Ph)O}] (4). A solution containing the chloropalladium(II) complex **1** (235 mg, 0.43 mmol) and LiBr (850 mg, 9.8 mmol) in acetone (20 cm³) was put aside for 15 h. The solvent was then removed and methanol added to the residue to give **4** as a yellow solid. Yield 166 mg, 65%. Found: C, 50.85; H, 4.4; Br, 13.4; N, 4.8; C₂₅H₂₆BrN₂OPPd requires C, 51.1; H, 4.45; Br, 13.6; N, 4.8%. MS (FAB) *m*/*z*: 589 (M⁺). ³¹P-{¹H} NMR (36.2 MHz, CDCl₃), $\delta_{\rm P}$ (ppm): 34.6 (s). ¹H NMR (100 MHz, CDCl₃), $\delta_{\rm H}$ (ppm): 1.53 (9H, s, Bu^t) and 3.98 [2H, d, ²*J*(PH) 12.1, CH₂].

[PdI{PPh₂CH₂C(Bu^t)=NN=C(Ph)O}] (5). A solution containing the chloropalladium(II) complex 1 (205 mg, 0.38 mmol) and NaI (1.2 g, 7.9 mmol) in acetone (20 cm³) was put aside for 15 h. The solvent was then removed and methanol added to the residue to give 5 as an orange solid. Yield 123 mg, 51%. A sample was recrystallised from CH₂Cl₂–MeOH. Found: C, 46.05; H, 3.95; I, 19.2; N, 4.2; C₂₅H₂₆IN₂OPPd·0.2CH₂Cl₂ requires C, 46.42; H, 4.0; I, 19.4; N, 4.3%. MS (FAB) m/z: 635 ([M + 1]⁺).

³¹P-{¹H} NMR (36.2 MHz, CDCl₃), $\delta_{\rm P}$ (ppm): 37.8 (s). ¹H NMR (100 MHz, CDCl₃), $\delta_{\rm H}$ (ppm): 1.53 (9H, s, Bu^t) and 4.02 [2H, d, ²*J*(PH) 12.1, CH₂].

[PtBr{PPh₂CH₂C(Bu^t)=NN=C(Ph)O}] (6). A solution containing the chloroplatinum(II) complex (2) (175 mg, 0.27 mmol) and LiBr (540 mg, 5.15 mmol) in acetone (20 cm³) was put aside for 15 h. The solvent was then removed and methanol added to the residue to give **6** as a yellow solid. Yield 92 mg, 50%. A sample was recrystallised from CH₂Cl₂–MeOH. Found: C, 43.7; H, 3.6; Br, 11.5; N, 4.3; C₂₅H₂₆BrN₂OPPt·0.2CH₂Cl₂ requires C, 43.6; H, 3.8; Br, 11.5; N, 4.0%. MS (FAB) *m/z*: 677 ([M + 1]⁺). ³¹P-{¹H} NMR (36.2 MHz, CDCl₃), $\delta_{\rm P}$ (ppm): 0.88 (s), ¹J(PtP) = 3919. ¹H NMR (100 MHz, CDCl₃), $\delta_{\rm H}$ (ppm): 1.58 (9H, s, Bu^t) and 3.63 [2H, d, ²J(PH) 11.3, ³J(PtH) 9.9, CH₂].

[PtI{PPh₂CH₂C(Bu¹)=NN=C(Ph)O}] (7). A solution containing the chloroplatinum(II) complex **2** (155 mg, 0.24 mmol) and NaI (760 mg, 5.1 mmol) in acetone (20 cm³) was put aside for 15 h. The solvent was then removed and methanol added to the residue to give **7** as an orange solid. Yield 118 mg, 68%. Found: C, 41.1; H, 3.35; I, 17.3; N, 3.9; C₂₅H₂₆IN₂OPPt requires C, 41.5; H, 3.6; I, 17.55; N, 3.9%. MS (FAB) *m/z*: 724 ([M + 1]⁺). ³¹P-{¹H} NMR (36.2 MHz, CDCl₃), $\delta_{\rm P}$ (ppm): 2.79 (s), ¹*J*(PtP) = 3676. ¹H NMR (100 MHz, CDCl₃), $\delta_{\rm H}$ (ppm): 1.55 (9H, s, Bu^t) and 3.80 [2H, d, ²*J*(PH) 11.2, ³*J*(PtH) 9.7, CH₂].

[PtMe{PPh₂CH₂C(Ph)=NN=C(Ph)O}] (8). A solution containing [PtMe₂(cod)] (57 mg, 0.17 mmol) and the phosphine **I** (69 mg, 0.17 mmol) in benzene (4 cm³) was heated at 80 °C for 2 h. The solvent was then removed and methanol added to the residue to give **8** as a yellow solid. Yield 42 mg, 40%. Found: C, 50.95; H, 4.75; N, 4.5; C₂₆H₂₉N₂OPPt requires C, 51.05; H, 4.8; N, 4.6%. MS (FAB) *m*/*z*: 612 (M⁺). ³¹P-{¹H} NMR (36.2 MHz, CDCl₃), $\delta_{\rm P}$ (ppm): 4.5 (s), ¹*J*(PtP) = 4493. ¹H NMR (100 MHz, CDCl₃), $\delta_{\rm H}$ (ppm): 0.86 [3H, ³*J*(PH) 1.3, ²*J*(PtH) 71.8, PtMe], 1.51 (9H, s, Bu^t) and 3.78 [2H, d, ²*J*(PH) 11.0, ³*J*(PtH) 29.5, CH₂].

[Pd(PPh₃){PPh₂CH₂C(Bu[†])=NN=C(Ph)O}]BPh₄ (10). A solution containing the chloropalladium(II) complex 1 (106 mg, 0.19 mmol) and triphenylphosphine (52 mg, 0.19 mmol) in chloroform (5 cm³) was put aside for 1 h. The solvent was then removed and the residue redissolved in methanol (2 cm³), a solution of NaBPh₄ in methanol was added to give 10 as yellow crystalline solid. Yield 170 mg, 82%. Found: C, 73.25; H, 5.4; N, 2.35; C₆₇H₆₁BN₂OP₂Pd requires C, 73.85; H, 5.65; N, 2.6%. MS (FAB) *m/z*: 769 ([M – BPh₄]⁺). ³¹P-{¹H} NMR (36.2 MHz, CDCl₃), δ_P (ppm): 24.9 (d), 37.8 (d), ²J(PP) = 26. ¹H NMR (100 MHz, CDCl₃), δ_H (ppm): 1.41 (9H, s, Bu^t) and 3.89 [2H, dd, ²J(PH) 11.8, ⁴J(PH) 1.4, CH₂].

[PtMe{PPh₂CH₂C(Ph)=NNC(=O)Ph}{PPh₂CH₂C(Ph)=

NNHC(=O)Ph}] (11). A solution of the phosphine II (103 mg, 0.24 mmol) and [PtMe2(cod)] (40 mg 0.12 mmol) in benzene (5 cm³) was put aside for 25 min. The solvent was then evaporated to low volume under reduced pressure and n-hexane added to the residue to give 11 as an orange solid. Yield 111 mg, 87%. Found: C, 61.45; H, 4.45; N, 5.2; C₅₅H₄₈N₄O₂P₂Pt·CH₃OH requires C 61.9; H, 4.8; N, 5.15%. MS (FAB) m/z: 1054 $([M + 1]^{+})$ and 1038 $([M - Me]^{+})$. IR (cm^{-1}) : v(N-H) = 3050m. ³¹P-{¹H}NMR (36.2 MHz, CDCl₃), $\delta_{\rm P}$ (ppm): 22.4 (d), ¹J(PtP) = 2898; 52.2 (d), ${}^{1}J(PtP) = 3098$ and ${}^{2}J(PP) = 472$. ${}^{1}H$ NMR (100 MHz, CDCl₃), δ_H (ppm): 0.16 [3H, t, ³J(PH) 7.3, ²J(PtH) 70.9, PtMe], 3.92 (2H, br, CH₂), 4.92 [2H, d, ²J(PH) 14.7, ³*J*(PtH) 29.3, CH₂] and 9.46 [1H, br, NH, exchanges with D₂O]. ¹³C-{¹H} NMR (100.6 MHz, CDCl₃) $\delta_{\rm C}$: -19.4 [1C, t, ²J(PC) 6.7, ¹J(PtC) 576, PtMe], 26.2 [1C, d, ¹J(PC) 26.0, CH₂], 27.7 [1C, d, ¹J(PC) 21.8, CH₂], 147.4 (1C, s, C=N), 155.4 [1C, d, ²J(PC) 6.2, C=N], 166.2 (1C, s, C=O) and 172.9 (1C, s, C=O).

[Pt{PPh₂CH=C(Ph)NN=C(Ph)O}{PPh₂CH₂C(Ph)=NNHC-(=O)Ph}] (12). A solution containing the phosphine II (96 mg, 0.23 mmol) and [PtCl₂(NCMe)₂] (40 mg, 0.11 mmol) in dichloromethane (5 cm³) was warmed for 10 min, then treated with triethylamine (0.1 cm³) and put aside for 20 min. The solvent was then removed and methanol added to the residue to give (12) as an orange solid. Yield 66 mg, 58%. Found: C, 61.85; H, 4.1; N, 5.5; C₅₄H₄₄N₄O₂P₂Pt·CH₃OH requires C, 61.75; H, 4.5; N, 5.25%. MS (FAB) *m*/*z*: 1038 ([M + 1]⁺). [Pd{PPh₂CH=C(Ph)NHNC(=O)Ph}₂] (15). A solution containing the phosphine **II** (109 mg, 0.26mmol) and [PdCl₂(NCPh)₂] (50 mg, 0.13 mmol) in dichloromethane (5 cm³) was treated with triethylamine (0.1 cm³, 0.7 mmol) and the mixture put aside for 12 h. The solvent was then removed and methanol added to the residue to give **15** as an orange solid. Yield 100 mg, 81%. Found: C, 67.75; H, 4.45; N, 5.9; C₅₄H₄₄N₄O₂P₂Pd·0.2CH₂Cl₂ requires C, 67.4; H, 4.6; N, 5.7%. MS (FAB) *m*/*z*: 949 ([M + 1]⁺). IR (cm⁻¹): *v*(C=C) = 1595m and *v*(N–H) = 3325m. ³¹P-{¹H} NMR (36.2 MHz, CDCl₃), $\delta_{\rm P}$ (ppm): 5.7 (s). ¹H NMR (100 MHz, CDCl₃), $\delta_{\rm H}$ (ppm): 4.10 [1H, dd, ²*J*(PH) 2.7, ⁴*J*(HH) 1.7, PCH=] and 8.09 [1H, br, NH, exchanges with D₂O].

[Pt{PPh₂CH=C(Ph)NHNC(=O)Ph}₂] (16). A solution containing the phosphine II (104 mg, 0.25 mmol) and [PtCl₂(NCPh)₂] (58 mg, 0.12 mmol) in dichloromethane (5 cm³) was treated with triethylamine (0.1 cm³) and then put aside for 20 h. The solvent was then removed and methanol added to the residue to give **16** as a pale yellow solid. Yield 96 mg, 78%. Found: C, 61.75; H, 4.0; N, 5.25; $C_{54}H_{44}N_4O_2P_2pt \cdot 0.2CH_2Cl_2$ requires C, 61.7; H, 4.2; N, 5.3%. MS (FAB) *m/z*: 1038 ([M + 1]⁺). IR (cm⁻¹): ν (C=C) = 1595m and ν (N–H) = 3320m. ³¹P-{¹H} NMR (36.2 MHz, CDCl₃), δ_P (ppm): -16.6(s), ¹*J*(PtP) = 3311. ¹H NMR (100 MHz, CDCl₃), δ_H (ppm): 4.15 [1H, dd, ²*J*(PH) 4.6, ⁴*J*(HH) 1.3, ³*J*(PtH) 37.8, PCH=] and 10.90 [1H, br, NH, exchanges with D₂O].

[PtCl{PPh₂CH[C(CO₂Me)=CH(CO₂Me]=C(Bu^t)N-N=

C(Ph)O }] (17). A solution of the chloroplatinum(II) complex 2 (70 mg, 0.11 mmol) and dimethyl acetylenedicarboxylate $(15 \mu l, 100 \text{ mmol})$ 0.12 mmol) in chloroform (2 cm³) was treated with triethylamine (15 µl) and then put aside for 12 h. The solvent was then removed and methanol added to the residue to give 17 as a pale pink solid. Yield 47 mg, 55%. Found: C, 47.8; H, 4.15; Cl, 4.7; N, 3.45; C₃₁H₃₃ClN₂O₅PPt requires C, 48.05; H, 4.3; Cl, 4.6; N, 3.6%. MS (FAB) m/z: 775 ([M + 1]⁺) and 738 (M-HCl). IR (cm⁻¹): v(C=O) = 1730s and v(Pt-Cl) = 345m. ³¹P-{¹H} NMR $(36.2 \text{ MHz}, \text{CDCl}_3), \delta_P \text{ (ppm): } 21.3(\text{s}), {}^1J(\text{PtP}) = 4089. {}^1H \text{ NMR}$ (100 MHz, CDCl₃), $\delta_{\rm H}$ (ppm): 1.42 (9H, s, Bu^t), 3.22 (3H, s, OMe), 3.68(3H, s, OMe), 5.56 [1H, d, ²*J*(PH) 13.6, ³*J*(PtH) 38.4, PCH] and 6.58 [1H, d, ⁴J(PH) 4.3, =CHCO₂]. ¹³C-{¹H} NMR (100.6 MHz, CDCl₃) δ_C: 28.8 (3C, s, CMe₃), 39.3 [1C, d, ³*J*(PC) 7.3, *C*Me₃], 52.3 (1C, s, OMe), 52.9 (1C, s, OMe), 57.5 [1C, d, ¹J(PC) 34.8, CHP], 131.2 (1C, s, =CHCO₂Me), 163.9 (1C, s, C=N), 165.3 [1C, d, J(PC) 2.8, C=N], 172.9 [1C, s, C=O] and 180.6 [1C, d, J(PC) 3.6, C=O). Molecular weight in chloroform = 767 Daltons; calc. for $C_{31}H_{33}ClN_2O_5PPt$ 775 Daltons.

[PdCl{PPh₂CH[C(CO₂Me)=CH(CO₂Me]=C(Bu^t)N-N= C(Ph)O}] (18). Compound 1 (710 mg, 1.3 mmol) and dimethyl acetylenedicarboxylate (0.27 ml, 2.2 mmol) in chloroform (10 cm³) was treated with triethylamine (0.30 ml) and the solution put aside for 5 h. The solvent was then removed and methanol added to the residue to give 18 as a pale pink solid. Yield 0.45 g, 51%. Found: C, 53.95; H, 4.6; Cl, 5.3; N, 4.15; C₃₁H₃₃ClN₂O₅PPd requires C, 54.3; H, 4.85; Cl, 5.1; N, 4.1%. MS (FAB) m/z: 685 (M⁺) and 649 (M–HCl). IR (cm⁻¹): v(C=O) = 1730s and v(Pd-Cl) = 340m. ³¹P-{¹H} NMR (36.2 MHz, CDCl₃), δ_{P} (ppm): 52.1(s). ¹H NMR (100 MHz, CDCl₃), $\delta_{\rm H}$ (ppm): 1.41 (9H, s, Bu^t), 3.26 (3H, s, OMe), 3.67 (3H, s, OMe), 5.60 [1H, d, ²J(PH) 14.7, PCH] and 6.69 [1H, d, ${}^{4}J(PH)4.4$, =CHCO₂]. ${}^{13}C-{}^{1}H$ NMR (100.6 MHz, CDCl₃) δ_{C} : 28.8 (3C, s, CMe₃), 39.5 [1C, d, ³J(PC) 9.5, CMe₃], 52.3 (1C, s, OMe), 52.8 (1C, s, OMe), 57.4 [1C, d, ¹J(PC) 27.5, CHP], 130.9 (1C, s, =CHCO₂Me), 163.8 (1C, s, C=N), 165.1 [1C, d, J(PC) 3.1, C=N], 172.5 [1C, d, J(PC) 3.5, C=O] and 178.4 [1C, d, J(PC) 3.4, C=O].

[PtBr{PPh₂CH[C(CO₂Me)=CH(CO₂Me]=C(Bu¹)NN=C(Ph)-O}] (19). A solution containing the chloroplatinum(II) complex **17** (118 mg, 0.15 mmol) and LiBr (415 mg, 4.8 mmol) in acetone (20 cm³) was put aside for 15 h. The solvent was then removed and methanol added to the residue to give **19** as a yellow solid. Yield 70 mg, 57%. Found: C, 44.6; H, 3.8; N, 3.35; C₃₁H₃₃BrN₂O₅PPt·0.3CH₂Cl₂ requires C, 44.5; H, 4.0; N, 3.3%. MS (FAB) *m/z*: 820 (M - 1). IR (cm⁻¹): ν (C=O) = 1735s. ³¹P-{¹H} NMR (36.2 MHz, CDCl₃), $\delta_{\rm P}$ (ppm): 20.9(s), ¹*J*(PtP) = 4011. ¹H NMR (100 MHz, CDCl₃), $\delta_{\rm H}$ (ppm): 1.48(9H, s, Bu¹), 3.35 (3H, s, OMe), 3.71(3H, s, OMe), 5.67 [1H, d, ²*J*(PH) 13.1, ³*J*(PtH) 22.5, PCH] and 6.65 [1H, d, ⁴*J*(PH) 4.3, =CHCO₂].

[PtI{PPh₂CH[C(CO₂Me)=CH(CO₂Me]=C(Bu^t)NN=C(Ph)-O}] (20). A solution containing the chloroplatinum(II) complex 17 (111 mg, 0.14 mmol) and NaI (429 mg, 2.9 mmol) in acetone (20 cm³) was put aside for 15 h. The solvent was then removed and methanol added to the residue to give 20 as an orange solid. This was recrystallised from CH₂Cl₂-MeOH. Yield 90 mg, 74%. Found: C, 41.7; H, 3.7; N, 3.8; C₃₁H₃₃IN₂O₅PPt·0.5CH₂Cl₂

Molecular weight in chloroform = 765 Daltons for calc. for $C_{31}H_{33}IN_2O_5PPd$ 777 Daltons.

[PtMe{PPh₂CH[C(CO₂Me)=CH(CO₂Me]=C(Bu^t)NN=C-

(Ph)O}] (23). A solution containing the methylplatinum(II) complex 9 (33 mg, 0.054 mmol) and dimethyl acetylenedicarboxylate (40 µl, 49 mg, 0.34 mmol) in chloroform (6 cm³) was treated with an excess of triethylamine (50 µl, 35 mg, 0.34 mmol) and then put aside for 24 h. The solvent was then removed and methanol added to the residue to give 23 as a pale yellow solid. Yield 24 mg, 64%. Found: C, 50.85; H, 4.7; N, 3.5; C₃₂H₃₆N₂O₅PPt requires C, 50.95; H, 4.8; N, 3.7%. MS (FAB) *mlz*: 753 (M – 1). IR (cm⁻¹): *v*(C=C) = 1640m and *v*(C=O) = 1730s. ³¹P-{¹H} NMR (36.2 MHz, CDCl₃), $\delta_{\rm H}$ (ppm): 26.1 (s), ¹J(PtP) = 4823. ¹H NMR (100 MHz, CDCl₃), $\delta_{\rm H}$ (ppm): 0.79 [3H, d, ¹J(PH) 1.3, ¹J(PtH) 71.6, PtMe], 1.46 (9H, s, Bu^t), 3.33 (3H, s, OMe), 3.68 (3H, s, OMe), 5.62 [1H, d, ²J(PH) 13.0, PCH] and 6.63 [1H, d, ⁴J(PH) 4.2, =CHCO₂].

[PtBr₂Cl{PPh₂CH[C(CO₂Me)=CH(CO₂Me]=C(Bu')NN=C-(Ph)O}] (24). A solution of bromine (0.22 mmol) in CCl₄ was added to a solution containing **17** (100 mg, 0.13 mmol) in CHCl₃ (5 cm³) and was put aside for 5 min. The solvent was then removed and methanol added to the residue to give **24** as an orange solid. Yield 50 mg, 41%. Found: C, 36.95; H, 3.15; N, 2.6; C₃₁H₃₃Br₂ClN₂O₅PPt·CHCl₃ requires C, 36.45; H, 3.25; N, 2.65%. MS (FAB) *mlz*: 775 ([M + 1 - 2Br]⁺). IR (cm⁻¹): ν (C=C) = 1640m and ν (C=O) = 1735s. ³¹P-{¹H} NMR (36.2 MHz, CDCl₃), $\delta_{\rm P}$ (ppm): 12.6 (s), ¹J(PtP) = 2504. ¹H NMR (100 MHz, CDCl₃), $\delta_{\rm H}$ (ppm): 1.64 (9H, s, Bu^t), 3.59 (3H, s, OMe), 3.67 (3H, s, OMe), 6.64 [1H, d, ²J(PH) 14.4, ³J(PtH) 10.2, PCH].

X-Ray crystallography

X-Ray diffraction experiments were carried out at 200 K on a Stoe STADI4 4-circle diffractometer with Mo-K α radiation ($\lambda = 0.71073$ Å) and an Oxford Cryosystems open-flow N₂ gas cryostat, following a standard procedure. Semi-empirical absorption corrections based on psi-scans were applied to all three datasets. The structures were solved by direct methods (SHELXS 86¹⁵) and refined by full-matrix least squares (against F^2) using SHELXL 97.¹⁶ All non-H atoms were refined with anisotropic displacement parameters, H atoms with isotropic displacement parameters. In the refinements, all the H atoms bonded to C atoms were allowed for as "riding" atoms. H atoms bonded to N in **12** and **13** were refined isotropically. Crystal data and experimental details are summarised in Table 4.

CCDC reference numbers 174213-174215.
