**$\beta$ -DIKETONE SYNTHESIS BY REACTION OF  
 $\alpha$ -HALOKETONES WITH ACID CHLORIDES OR ACID  
ANHYDRIDES PROMOTED BY SAMARIUM TRIIODIDE**

**ABSTRACT:** Promoted by  $\text{SmI}_3$ ,  $\alpha$ -haloketones were reacted with acid chlorides or acid anhydrides and  $\beta$ -diketones were synthesized via intermediate samarium enolates.

Recently the application of lanthanoid compounds in organic synthesis has been of great interest<sup>1</sup>. Very recently carbon-carbon bond formation reactions mediated by trivalent lanthanoid compounds have rapidly increased.  $\alpha$ -Haloketones react with aldehydes in the presence of  $\text{CeI}_3$  to give  $\alpha, \beta$ -unsaturated ketones<sup>2</sup>. We reported similar reactions promoted by  $\text{SmI}_3$ <sup>3</sup>. We assumed therein that samarium enolate formation from  $\alpha$ -haloketones is the key step of the reaction. Some months ago, Mori reported that in the presence of  $\text{SmI}_2$  or  $\text{SmI}_3$   $\alpha$ -haloketones can react with  $\alpha$ -ketocarboxylates and  $\alpha$ -diketones to form  $\alpha$ -hydroxy- $\gamma$ -ketocarboxyhelates and 2-hydroxy-1,4-diketones<sup>4</sup>. Here we wish

to report a facile synthesis of  $\alpha$ -diketones from  $\alpha$ -haloketones and acid chlorides or acid anhydrides mediated by  $\text{SmI}_3$ .

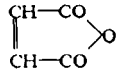

TABLE 1. Reaction Conditions and Yields with Acid Chlorides

No	Acid Chlorides	$\beta$ -Diketones	Reaction Time (h)	Yields (%)
1	$\text{CH}_3\text{COCl}$	$\text{PhCOCH}_2\text{COCH}_3$	0.5	65
2	$\text{CH}_3\text{CH}_2\text{COCl}$	$\text{PhCOCH}_2\text{COCH}_2\text{CH}_3$	0.5	82
3	$\text{CH}_3\text{CH}_2\text{CH}_2\text{COCl}$	$\text{PhCOCH}_2\text{COCH}_2\text{CH}_2\text{CH}_3$	1	67
4	$(\text{CH}_3)_2\text{CHCH}_2\text{COCl}$	$\text{PhCOCH}_2\text{COCH}_2\text{CH}(\text{CH}_3)_2$	1	72
5	$\text{CH}_3(\text{CH}_2)_4\text{COCl}$	$\text{PhCOCH}_2\text{CO}(\text{CH}_2)_4\text{CH}_3$	1	79
6	$\text{PhCOCl}$	$\text{PhCOCH}_2\text{COPh}$	0.5	71
7	$\text{CH}_3(\text{CH}_2)_7\text{COCl}$	$\text{PhCOCH}_2\text{CO}(\text{CH}_2)_7\text{CH}_3$	1	64
8	$\text{CH}_3(\text{CH}_2)_{10}\text{COCl}$	$\text{PhCOCH}_2\text{CO}(\text{CH}_2)_{10}\text{CH}_3$	1	60

TABLE 2. Reaction Conditions and Yields with Acid Chlorides

No	Acid Anhydrides	$\beta$ -Diketones	Reaction Time (h)	Yields (%)
1	$(\text{CH}_3\text{CO})_2\text{O}$	$\text{PhCOCH}_2\text{COCH}_3$	1	80
2		$\text{PhCOCH}_2\text{CO}-\text{C}=\text{C}-\text{H}$ $\text{HOOC}-\text{C}=\text{C}-\text{H}$	1.5	91
3	$(\text{CH}_3\text{CH}_2\text{CO})_2\text{O}$	$\text{PhCOCH}_2\text{COCH}_2\text{CH}_3$	1	86
4	$(\text{CH}_3\text{CH}_2\text{CH}_2\text{CO})_2\text{O}$	$\text{PhCOCH}_2\text{COCH}_2\text{CH}_2\text{CH}_3$	1	90
5	$[(\text{CH}_3)_2\text{CHCH}_2\text{CO}]_2\text{O}$	$\text{PhCOCH}_2\text{COCH}_2\text{CH}(\text{CH}_3)_2$	1.5	85
6	$[\text{CH}_3(\text{CH}_2)_4\text{CO}]_2\text{O}$	$\text{PhCOCH}_2\text{CO}(\text{CH}_2)_4\text{CH}_3$	1.5	81
7	$(\text{PhCO})_2\text{O}$	$\text{PhCOCH}_2\text{COPh}$	1.5	75

Similar to the reactions mentioned above, this reaction proceeds quickly and smoothly at room temperature and gives good yields. The acid anhydrides give better yields than acid chlorides. The solvent ( $\text{CH}_3\text{CN}$ ) and the acid chlorides and acid anhydrides must be dried thoroughly and freshly redistilled, otherwise the amounts of byproducts due to reduction of  $\alpha$ -haloketones will be increased. This suggests that the reaction intermediates may be the samarium (III) enolates formed in situ from  $\alpha$ -haloketones. THF can not be used as solvent as in the presence of  $\text{SmI}_2$  acid chlorides and acid anhydrides lead to THF ring opening<sup>5</sup>.

### Experimental

$^1\text{H}$  NMR spectra were recorded in  $\text{CCl}_4$  on JEOL PM 60si spectrometer using TMS as internal standard. IR spectra were obtained on a PE 683 spectrometer. Melting points are reported uncorrected.

The solvents used were pre-dried according to standard procedures. The acid chlorides and acid anhydrides used were freshly redistilled before use. The reactions were performed in a Schlenk type glass apparatus under a nitrogen atmosphere.

**General procedure for the preparation of  $\beta$ -diketones:**  $\alpha$ -haloketone (1mmol) in  $\text{CH}_3\text{CN}$  (2ml) and acid chloride (1mmol) in  $\text{CH}_3\text{CN}$  (2ml) were added sequentially to the  $\text{SmI}_2$  (1mmol) in  $\text{CH}_3\text{CN}$  (10ml) at room temperature. After being stirred for 1hr, dilute hydrochloric acid (0.1M, 1ml) was dropped into the solution and the resulting mixture was stirred for a few minutes. Before the reaction mixture was extracted with ether some of the  $\text{CH}_3\text{CN}$  was evaporated in vacuum. After usual work-up, the product was separated by preparative TLC (silica gel) with cyclohexane and ethyl acetate as eluent.
