THERMAL STUDIES ON COMPLEXES OF ZINC(II) AND CADMIUM(II) WITH 5,6-BENZOQUINOLINE-N-OXIDE

A.K. SRIVASTAVA. ANUPAMA SRIVASTAVA and P.C. JAIN

Meerut College, Meerut-250 001 (India) (Received 8 January 1988)

In recent years, a number of complexes of 5,6-benzoquinoline [1-5] and aromatic amine-N-oxides [6-9] have been isolated and characterised. However, the thermal investigations of these complexes have been carried out only to a limited extent. In this paper we report the thermal decomposition characteristics, i.e. cleavage of metal-ligand bond and accompanying enthalpy change, as determined by thermogravimetry (TG), differential thermal gravimetry (DTG) and differential thermal analysis (DTA), of zinc(II) and cadmium(II) complexes of 5,6-benzoquinoline-N-oxide and their intermediates.

EXPERIMENTAL

5,6-Benzoquinoline was obtained from Merck and its oxide was prepared by the method described for quinoline-N-oxide [10]. The metal salts and other chemicals used were of BDH AnalaR grade.

The metal complexes were prepared by the following general method: an ethanolic solution of the corresponding metal salt (0.01 mole in 40 ml) was refluxed with a solution of the ligand (0.04 mole in 30 ml ethanol) on a waterbath for about 0.5 h. From the refluxate the complexes were separated either on standing or on concentrating and cooling to room temperature. The product was collected, washed with cold ethanol and finally with diethylether and dried in vacuo over P_4O_{10} .

The elemental analyses and physical measurements were made as reported earlier [11]. The differential thermal analysis and thermogravimetry units employed were similar to those described earlier [12]. All experiments were carried out in static air. Heating rates employed were 10 °C min⁻¹ for DTA and 5 °C min⁻¹ for TGA.

RESULTS AND DISCUSSION

The composition together with the analytical and partial IR data of Zn(II) and Cd(II) complexes of 5,6-benzoquinoline-N-oxide (BenzqnO) are

Analytical, partial IR and thermal decomposition data of 5,6-benzoquinoline-N-oxide complexes of Zn(II) and Cd(II)

reported in Table 1. The IR assignments are largely based on the assignments in benzoquinoline and quinoline-N-oxide [13]. The decrease in the frequency of the $\nu(NO)$ vibrations from 1235 cm⁻¹ in the ligand to 1220 \pm 5 cm⁻¹ in the complexes is attributed to a change in the nature of the nitrogen-oxygen bond as a result of metal-oxygen coordination [6-9]. The $\delta(NO)$ bending vibration, observed at 840 cm⁻¹ in BenzqnO, also shows a slight shift supporting the metal-oxygen coordination [6-9]. The bands observed in the 450-430 cm⁻¹ region have been tentatively assigned to metal-oxygen stretching vibration. In the thiocyanate complexes, the $\nu(C-S)$ vibrations lie in the 860-820 cm⁻¹ region and $\nu(C-N)$ in the 2080-2060 cm⁻¹ region, strongly suggesting N-bonded NCS [14].

Thermal studies

The TG and DTG curves do not show the presence of water. TG analysis of the complexes shows that all the Zn(II) and Cd(II) complexes are stable up to about 200 °C, beyond which decomposition starts and continues up to about 300 °C. Analysis of the thermograms shows that two moles of BenzqnO are lost at this stage. It is therefore assumed that two molecules of the ligand are loosely bonded to the metal in the complexes. On further heating in the temperature range 305-405 °C the complexes $MX_2 \cdot 2BenzqnO$ (M = Zn, Cd) lose all the remaining ligand molecules. Finally, metal oxide is obtained as residual mass at about 600 °C. In all cases, the second decomposition reaction is indicated by the endo peak and the final decomposition to metal oxide by the exo peak in the DTG curve.

Thus, the analysis of the thermograms indicates that the decomposition process is completed in the following three steps

$$MX_2 \cdot 4BenzqnO \rightarrow MX_2 \cdot 2BenzqnO \rightarrow MX_2 \rightarrow MO$$

$$(M = Zn, Cd; X = Cl, Br, CH3COO, NCS).$$

If the minimum TG decomposition temperature is taken as a rough criterion of thermal stability, then the order for the complexes reported herein is: $Cl > Br > NCS > CH_3COO$.
