Abstract—Cobalt(II) chloride hexahydrate (CoCl<sub>2</sub>· $6H_2O$ ) has been found to catalyze the tosylation of both aliphatic and aromatic alcohols with *p*-toluenesulfonic acid (*p*-TsOH) in high yields in 1,2-dichloroethane under reflux (ca. 80 °C). In the case of aliphatic alcohols, secondary alcohols undergo tosylation chemoselectively in the presence of primary hydroxy groups. © 2003 Elsevier Ltd. All rights reserved.

The tosylation of alcohols is a frequently used functional transformation in organic chemistry.<sup>1</sup> Typically, the moisture sensitive and very reactive sulfonyl chloride or anhydride are usually employed as the tosylating agents in the presence of bases.<sup>2</sup> Sulfonic acids are also used as tosylating agents but expensive alkylating agents such as trialkyl orthoformate, alkyl ethers or esters are needed instead of the alcohol.<sup>3</sup> Recently, organic base adducts of sulfonyls such as 1-phenylsulfonyl benzotriazole and aryl sulfonyl methylimidazolium salts have been employed for sulfonate synthesis, however, significant amounts of by-products in the form of total dissolved salts are generated.<sup>4</sup> More recently, Fe<sup>3+</sup>montmorillonite clay has been reported to catalyze the tosylation of alcohols with p-TsOH.<sup>5</sup> This method works well with aliphatic alcohols but aromatic alcohols give rearranged or polymeric products. Herein, we wish to report a simple and efficient method for the direct tosylation of both aliphatic and aromatic alcohols with 1 equiv of p-TsOH in the presence of CoCl<sub>2</sub>·6H<sub>2</sub>O in high yields (Scheme 1). This protocol also functions in the absence of additives and the removal of water is not warranted. In contrast to the Fe<sup>3+</sup>-montmorillonite catalyzed process,<sup>5</sup> this methodology chemoselectively catalyzes the tosylation of aliphatic secondary alcohols in the presence of primary hydroxy groups in high yields.

$$R \xrightarrow{OH} R' \xrightarrow{5 \mod \% \operatorname{CoCl}_2 \cdot 6\operatorname{H}_2 O}_{1 \operatorname{equiv} p\text{-TsOH}} \xrightarrow{OTs}_{R} \xrightarrow{H}_{R'} + \operatorname{H}_2 O$$

$$\xrightarrow{\operatorname{ClCH}_2\operatorname{Cl}_2\operatorname{Cl}}_{\operatorname{reflux}} \xrightarrow{26-95\%}_{R=\operatorname{alkyl}, \operatorname{aryl}; R'=\operatorname{alkyl}, H}$$

Scheme 1.

In the presence of a catalytic amount of  $CoCl_2 \cdot 6H_2O$ , the tosylation of 4-methoxylbenzyl alcohol was first examined with *p*-TsOH (Table 1). Toluene,  $CH_2Cl_2$ ,

Table 1. To sylation of 4-methoxybenzyl alcohol with p-TsOH and CoCl<sub>2</sub>·6H<sub>2</sub>O

	<i>p</i> -T	$CoCl_2 \cdot 6H_2O$ rsOH	- CH <sub>2</sub> OMe	
Entry	Solvent	Temperature (°C)	Time (h)	Yield (%) <sup>a,b,c</sup>
1	$CH_2Cl_2$	Rt	14	67
2	ClCH <sub>2</sub> CH <sub>2</sub> Cl	Reflux	1	95
3	CH <sub>3</sub> CN	Reflux	14	41
4	Toluene	Reflux	3	78

<sup>a</sup> A solution of the substrate (3 mmol), *p*-TsOH (3 mmol), CoCl<sub>2</sub>·6H<sub>2</sub>O (5 mol%), and solvent (10 mL) was stirred for the appropriate time and temperature.

<sup>b</sup> Isolated yield.

<sup>c</sup> The identity of the product was ascertained by NMR, IR, and mass spectrometric analysis.

CH<sub>3</sub>CN, and ClCH<sub>2</sub>CH<sub>2</sub>Cl were employed as the solvents. As expected, the reaction took place and afforded 4-methoxybenzyl tosylate in good yields when the reaction mixtures were allowed to stir in the presence of 5 mol % CoCl<sub>2</sub>·6H<sub>2</sub>O. Among the solvents screened, ClCH<sub>2</sub>CH<sub>2</sub>Cl was found to be suitable for this protocol and the highest yield of 95% was obtained under reflux (ca. 80 °C). The reactions in CH<sub>2</sub>Cl<sub>2</sub>, CH<sub>3</sub>CN, and toluene were less effective and afforded the tosylate in 41–78% yields. Control reactions without CoCl<sub>2</sub>·6H<sub>2</sub>O under the same reaction conditions showed no reaction.

The reactions of a series of other aromatic and aliphatic alcohols were next pursued with *p*-TsOH in  $ClCH_2CH_2Cl$  as above (Table 2, entries 1–10).<sup>6</sup> Benzylic alcohols, benzyl-, 4-nitrobenzyl, and 1-phenylpropyl alcohol, were converted to the corresponding tosylates in 78–91% yields. Similarly, allylic alcohols, cinnamyl alcohol, and geraniol, underwent tosylation to afford the corresponding tosylates in 90–95% yields. In the case of the aliphatic alcohols, secondary alcohols were tosylated much faster compared to primary hydroxy groups. For example, 2-butanol, cyclohexanol, menthol, and cholesterol were transformed into the corresponding tosylates in 87-95% yields within 3.5 h, whereas decanol was less reactive and afforded decyl tosylate in only 26% yield after 10 h. When a mixture of cyclohexanol and n-hexanol was allowed to react with 0.5 equiv p-TsOH for 1 h, cyclohexanol underwent tosylation chemoselectively in 95% yield along with a trace of *n*-hexyl tosylate (Scheme 2). These studies clearly reveal that this methodology can be applied for the chemoselective direct tosylation of aliphatic secondary alcohols in the presence of primary hydroxy groups. Furthermore, when the tosylation of phenol and  $\beta$ -naphthol was examined, no reaction was observed and the starting materials were recovered intact.

 Table 2. Cobalt(II) catalyzed tosylation of alcohols with *p*-TsOH<sup>6</sup>

Entry	Substrate	Time (h)	Product	Yield (%) <sup>a,b,c</sup>
1	CH <sub>2</sub> OH	2.5	CH2OTs	91
2	O <sub>2</sub> N CH <sub>2</sub> OH	6	O <sub>2</sub> N CH <sub>2</sub> OTs	78
3	CH <sub>2</sub> OH	0.5	CH <sub>2</sub> OTs	90
4	CH2OH	0.75	CH <sub>2</sub> OTs	95
5	H <sub>15</sub> C <sub>7</sub> CH <sub>2</sub> OH	10	H <sub>15</sub> C <sub>7</sub> CH <sub>2</sub> OTs	26
6	OH C	1.5	OTS	88
7	OH ,	3.5	OTs	87
8	OH	1	OTs	95
9	У-мон	1	↓ → → → OTs	93
10	HO	1	TSO	88

<sup>a</sup> Substrate (3 mmol), *p*-TsOH (3 mmol), and CoCl<sub>2</sub>·6H<sub>2</sub>O (5 mol %) were dissolved in ClCH<sub>2</sub>CH<sub>2</sub>Cl (10 mL) and the solution was stirred under reflux (ca. 80 °C) for the appropriate time.

<sup>b</sup> Isolated yield.

<sup>c</sup> Identification of the products was ascertained by NMR, IR, and mass spectrometric analysis.

## Scheme 2.

In conclusion, the present methodology describes a simple procedure for the direct tosylation of alcohols with *p*-TsOH in the presence of the inexpensive  $CoCl_2$ ·6H<sub>2</sub>O in high yields. It functions in the absence of additives and generates water as the only by-product. In the case of aliphatic alcohols, secondary alcohols are transformed to the corresponding tosylates chemoselectively in the presence of the primary hydroxy groups.

- 6. Alcohol (3 mmol), *p*-TsOH (3 mmol) and CoCl<sub>2</sub>·6H<sub>2</sub>O (5 mol%) were dissolved in ClCH<sub>2</sub>CH<sub>2</sub>Cl (10 mL) and the solution was stirred under reflux (ca. 80 °C) for the appropriate time (see Table 2). The reaction mixture was then allowed to cool to ambient temperature and diethyl ether (50 mL) was added. The catalyst was removed by filtration and the filtrate was washed successively with saturated NaHCO<sub>3</sub> solution (3×10 mL), brine (2×10 mL), and water (1×10 mL). Drying (Na<sub>2</sub>SO<sub>4</sub>) and evaporation of the solvent on a rotary evaporator afforded a residue, which was passed through a short pad of silica gel using a mixture of ethyl acetate and hexane as eluent to afford the analytically pure tosylate.
