Abstract: In our recent report on the enantioselective synthesis of syn and anti 1,2-diols from oxalyldi-(N-methyl-N-methoxyamide), an unfortunate sample inversion for <sup>13</sup>C NMR analysis led us to an incorrect attribution of their relative configurations. We report now the correction of the configurations of these diols by X-ray analysis and chemical correlation to two known natural products, goniobutenolides A and B. © 1998 Elsevier Science Ltd. All rights reserved.

We previously reported a straightforward synthesis of enantiomerically pure syn and anti 1,2-diols from an oxalic acid derivative.<sup>1</sup> Unfortunately a sample inversion for <sup>13</sup>C NMR analysis of the acetonides 8 and 9 (Scheme 1), derived from diols 6 led us to an incorrect attribution of their relative configurations. We report now the X-ray determination of the absolute configuration of diols 6 as well a chemical correlation to the known natural products goniobutenolides A and B.

The scheme 1 is the corrected version of the results already described.<sup>1</sup> The  $\beta$ -hydroxy- $\gamma$ -ketosulfoxides 5 were obtained from the di-N-methyl-N-methoxyamide of oxalic acid in four steps via a high S diastereoselective DIBAL-H reduction of the  $\beta$ -keto sulfoxide 2 as a key step.<sup>2</sup> The  $\beta$ -hydroxysulfoxide (*R*,S)-3 was easily transformed into 5 by a Grignard reaction. The absolute configuration of the hydroxy center in compound 5 was deduced from our previous results<sup>2</sup> and established by chemical correlation with the known product 7 where R' = Ph.

As shown in table I, which is the corrected version of the results already reported<sup>1</sup>, DIBAL-H reduction of the  $\beta$ -silyloxy- $\gamma$ -ketosulfoxide 5 afforded the corresponding *anti*-diol 6 with good to excellent yields and diastereoselectivity except for 5a (R' = methyl) for which a Lewis acid catalysis [Yb(OTf)<sub>3</sub>] was required.<sup>1</sup> In

sharp contrast the same reaction, in the presence of the chelating Lewis acid  $ZnI_2$ , afforded in high yield and high diastereoselectivity only the *syn*-diol 6 (Scheme 1, Table I). The error in the attribution of the relative configurations of carbons C-2 and C-3 in diols 6 was due to an inversion of the samples for the <sup>13</sup>C NMR analysis of the acetonides 8 and 9 ( a smaller non-equivalence between the *gem*-dimethyl groups<sup>3</sup> for the *syn* diol, 0.8 ppm, than for the *anti* diol, 3 ppm). We report now a new assignment of the absolute and relative configurations, shown in scheme 1 and Table I, by X-ray analysis and chemical correlation.

[S(R),2(S)] 5		Reduction Conditions			[S(R),2(S),3(R)]-Syn 6, $[S(R),2(S),3(S)]$ -anti 6		
	R	Lewis Acid	reaction time	reaction temp.	isolated yield	de%	Anti -6 / Syn -6
а	Me	Yb(OTf)3	lh	-78°C	96% <sup>a</sup>	92%	96/4
a	Me	ZnI <sub>2</sub>	3h	-78°C	96% <sup>a</sup>	94%	3/97
b	Ph		30 min	-78°C	95% <sup>b</sup>	92%	96/4
b	Ph	ZnI <sub>2</sub>	30 min	-78°C	92% <sup>b</sup>	>95%	2/98
с	allyl		30 min	-78°C	93% <sup>6,c</sup>	>95%	98/2

Table I. Reduction of  $\beta$ -silyloxy  $\gamma$ -ketosulfoxide 5 to syn and/or anti  $\beta$ -silyloxy  $\gamma$ -hydroxysulfoxide 6.

a) isolated by crystallisation; b) isolated by chromatography; c) 2.5eq of DIBAL-H.

The erythro configuration of the anti-diol **6b** ( $\mathbf{R'} = \mathbf{Ph}$ ) obtained by reduction with DIBAL-H was confirmed by-X ray analysis of the corresponding acetonide **8b** showing (figure 1) a S( $\mathbf{R}$ ), 9(S), 10(S) configuration.

Figure 1. ORTEP plot of the acetonide **8b**, R'=Ph. Selected mean bond lenghts (Å) : S-O1, 1.502; S-C8, 1.804; C8-C9, 1.511; C1-S, 1.795; C1-C2, 1.383. Important dihedral angles: C6-C1-S, 118.7; C1-S-C8, 97.6; C1-S-O1,107.5; O1-S-C8, 105.2; S-C8-C9, 108.9; The <sup>13</sup>C NMR spectra<sup>4</sup> of **8b** and **9b** respectively prepared from the *anti*-diol **6b** and the *syn*-diol **6b** are in agreement with the non-equivalence of the gem-dimethyl groups known for *syn* and *anti*-diol acetonides.<sup>3</sup>

Finally we made a chemical correlation with the known natural products<sup>5</sup> Goniobutenolides A, 11 and B, 12, which are extracted from the stem bark of *Goniothalamus giganteous* Hook.f.& Thomas (Annonaceae).

The absolute configurations of the natural products 11 and 12 led us to prepare the *anti*-diol **6b** in the S(S),  $2R,3R^6$  configuration starting from (-)-(S)-methyl-p-tolylsulfoxide (Scheme 2). Then the corresponding S(S),2R,3R-acetonide **8b** was submitted to a Pummerer rearrangement to give the acetonide 10b, which was finally transformed into a 1.5/1 mixture of goniobutenolides A and B following the procedure of Ko and

Lerpinière.<sup>5</sup> Compounds 11 and 12 were separated by flash chromatography. They both showed all the characteristics described in literature<sup>5</sup>: 11:  $[\alpha]_D$  +191 (c 0.1, CHCl<sub>3</sub>); 12: mp 142°,  $[\alpha]_D$  -106 (c 0.1, CHCl<sub>3</sub>).

In conclusion the relative configuration of the diols 6 obtained by stereoselective sulfoxide directed reduction of  $\beta$ -hydroxy- $\gamma$ -ketosulfoxides of type 5 is corrected as erythro with DIBAL-H or DIBAL-H / Yb(OTf)<sub>3</sub> or three with DIBAL-H/ZnI<sub>2</sub>.
