A simple and highly efficient synthesis of penta- and tri-substituted pyrroles has been developed using the Paal–Knorr reaction catalysed by aqueous zinc tetrafluoroborate at room temperature under solvent-free conditions.

Pyrroles are important heterocyclic constituents of natural products,¹ bioactive molecules² and electrically conducting materials.³ Hence, substantial efforts have been made to develop efficient methods for the synthesis of these compounds.⁴ The Paal–Knorr reaction, in which 1,4-dicarbonyl compounds are converted into pyrroles *via* acid-mediated cyclization with primary amines, remains most common and attractive. Procedures using catalysts such as potassium exchanged layered zirconium phosphate (1–24 h, room temperature),^{4(a)} montmorillonite–KSF (10–25 h, room temperature),^{4(b)} ionic liquid (0.5–6 h, room temperature),^{4(c)} Bi(OTf)₃/[bmIm]BF₄ (4–5 h, 90 °C),^{4(d)} microwave (3 min)^{4(e),4(f),4(o)} and Bi(NO₃)₃ (10–25 h, room temperature)^{4(g)} have been employed for the Paal–Knorr synthesis of pyrroles. There are also other approaches to the synthesis of these compounds.^{4(h)–(n)} However, these procedures provide primarily tri-substituted pyrroles and access to tetra- and penta-substituted ones is very limited.^{4(f),4(k)} Many of these procedures require long reaction times and expensive catalysts.

We report here a very simple and efficient methodology for the synthesis of penta- and tri-substituted pyrroles by the Paal–Knorr reaction catalysed by aqueous zinc tetrafluoroborate⁵ without any organic solvent (Scheme 1).

Scheme 1

1,4-Diketones were condensed with aliphatic and aromatic amines by this reaction to produce substituted pyrroles.[†] The results are summarised in Table 1. Functional groups such as OMe, CO₂H, OH, Cl and SH on the amines remained intact under the reaction conditions. On the other hand, both electron-

withdrawing and electron-donating substituents on the 1,4-diketones are well acceptable in this procedure.

In general, the reactions are very clean, fast and high yielding. This procedure gives an easy access to penta-substituted pyrroles,

[†] General procedure for the synthesis of pyrroles. A mixture of a primary amine (1.2 mmol) and 1,4-diketone (1 mmol) was stirred at room temperature in the presence of a catalytic amount (0.01 ml, 2 mol%) of an aqueous solution (40%) of zinc tetrafluoroborate for a few minutes as required to complete the reaction (TLC). The reaction mixture was then extracted with diethyl ether (3×10 ml), and the extract was washed successively with aqueous HCl (1.3 N) and water. It was then dried (Na₂SO₄) and evaporated to leave the crude product, which was purified by column chromatography on silica gel (hexane–ethyl acetate, 95:5) to provide the pure product (61–90%). The new compounds (Table 1, entries 2, 3, 5–11) are properly characterised by their spectroscopic data (IR, ¹H and ¹³C NMR) and elemental analyses.

Entry 2: white solid, mp 48 °C. IR (ν/cm^{-1}): 1429, 1544, 1693. ¹H NMR (300 MHz, CDCl₃) δ : 0.88 (t, 3H, *J* 5.1 Hz), 1.13–1.19 (m, 2H), 1.24 (t, 6H, *J* 7.1 Hz), 1.42–1.50 (m, 2H), 2.19 (s, 6H), 3.67 (t, 2H, *J* 7.8 Hz), 4.15 (q, 4H, *J* 7.1 Hz). ¹³C NMR (75 MHz, CDCl₃) δ : 10.5 (2C), 13.4, 13.9 (2C), 22.0, 32.1, 43.2, 59.6 (2C), 115.6 (2C), 132.5 (2C), 165.5 (2C). Found (%): C, 65.35; H, 8.77; N, 4.56. Calc. for C₁₆H₂₅NO₄ (%): C, 65.06; H, 8.53; N, 4.74.

Entry 3: white solid, mp 53 °C. IR (ν/cm^{-1}): 1544, 1683, 1703. ¹H NMR (300 MHz, CDCl₃) δ : 0.89 (t, 3H, *J* 6.3 Hz), 1.21–1.31 (m, 6H), 1.38 (t, 6H, *J* 7.2 Hz), 1.54–1.61 (m, 2H), 2.36 (s, 6H), 3.73 (t, 2H, *J* 7.8 Hz), 4.25 (q, 4H, *J* 7.2 Hz). ¹³C NMR (75 MHz, CDCl₃) δ : 10.6 (2C), 13.7, 14.0 (2C), 22.3, 26.2, 30.1, 31.1, 43.6, 59.8 (2C), 112.0 (2C), 132.5 (2C), 165.6 (2C). Found (%): C, 66.57; H, 8.91; N, 4.15. Calc. for C₁₈H₂₉NO₄ (%): C, 66.84; H, 9.04; N, 4.33.

Entry 5: reddish gummy oil. IR (ν/cm^{-1}): 1382, 1610, 1701. ¹H NMR (300 MHz, CDCl₃) δ : 1.23 (t, 6H, *J* 7.0 Hz), 2.03 (s, 6H), 3.76 (s, 3H), 4.18 (q, 4H, *J* 7.0 Hz), 6.89 (d, 2H, *J* 7.0 Hz), 6.97 (d, 2H, *J* 7.0 Hz). ¹³C NMR (75 MHz, CDCl₃) δ : 11.5 (2C), 14.1 (2C), 55.3, 59.9 (2C), 112.1 (2C), 114.5 (2C), 128.9 (2C), 129.2, 134.3 (2C), 159.6, 165.5 (2C). Found (%): C, 66.08; H, 6.66; N, 3.99. Calc. for C₁₉H₂₃NO₅ (%): C, 66.07; H, 6.71; N, 4.06.

In conclusion, the present procedure using an inexpensive catalyst like zinc tetrafluoroborate provides a very simple one-pot synthesis of pyrroles. The significant advantages offered by this procedure are: (a) easy access to highly functionalised units; (b) faster reaction (5–60 min) compared to other methods; (c) mild conditions (room temperature); (d) organic solvent-free reaction and (e) cost effectiveness.

This study was supported by CSIR, New Delhi [grant no. 01(1936)/04]. S.G. and A.D. acknowledge the support of CSIR for their fellowships.
