Concise synthesis of (–)-steviamine and analogues and their glycosidase inhibitory activities[†]

Nadechanok Jiangseubchatveera,^{a,b} Marc E. Bouillon,^a Boonsom Liawruangrath,^b Saisunee Liawruangrath,^c Robert J. Nash^d and Stephen G. Pyne^{*a}

A concise synthesis of (–)-steviamine is reported along with the synthesis of its analogues 10-*nor*-steviamine, 10-*nor*-ent-steviamine and 5-*epi-ent*-steviamine. These compounds were tested against twelve glycosidases (at 143 μ g mL⁻¹ concentrations) and were found to have in general poor inhibitory activity against most enzymes. The 10-*nor* analogues however, showed 50–54% inhibition of α -L-rhamnosidase from *Penicillium decumbens* while one of these, 10-*nor*-steviamine, showed 51% inhibition of *N*-acetyl- β -D-glucosaminidase (from Jack bean) at the same concentration (760 μ M).

Introduction

(-)-Steviamine 1 is the most recent member of the polyhydroxylated indolizidine natural products (Fig. 1). Steviamine was isolated from the leaves of Stevia rebaudiana (Asteraceae) and its absolute configuration was established by X-ray crystallographic analysis of its hydrobromide salt.^{1,2} (–)-Steviamine 1 is the first polyhydroxylated indolizidine to have a methyl group at C-5 and a hydroxymethyl group at C-3. This group of alkaloids which includes, swainsonine 2, castanosperimine 3 and lentiginosine 4 (Fig. 1) have potential utility as antidiabetic, antiviral, anticancer and immunoregulatory agents.³ Unlike swainsonine 2, steviamine 1 and its synthesised enantiomer ((+)-steviamine), have shown relatively weak to modest glycosidase inhibitory activity against a number of different glycosidases.⁴ The most potent activity found in this study was against β -galactosidase (from rat intestinal lactase), where *ent*steviamine had an IC₅₀ value of 35 µM.⁴ While, ent-steviamine⁴ and some of its analogues, including 10-nor-steviamine 5 (and some of its 1,2,3,8a-epimers),⁵ 5-epi-ent-steviamine 7⁴ and 1,3di-epi-10-(4-methoxyphenyl)steviamine⁶ have been synthesized recently, (-)-steviamine 1 itself has not been previously prepared. We report here a concise synthesis of (-)-steviamine 1

Scheme 1 Synthesis of steviamine 1 and 10-*nor*-steviamine 5 and its triacetate derivative 14.

L-β-ribofuranose derivative 8^9 ((3S,4R,5S)-4-(benzyloxy)-5-(benzyloxymethyl)tetrahydrofuran-2,3-diol) and commercially available (R)-4-penten-2-amine HCl 9a and E-styrylboronic acid 10 (Scheme 1). Stirring these three components in the presence of triethylamine (to generate the free amine of 9a) in ethanol at rt for 4 d, gave, after purification of the crude reaction mixture by column chromatography, the amino alcohol 11 in 77% yield, as a single diastereomer. Shorter reaction times (1-2 d) and other solvents (e.g. MeOH, CH₂Cl₂ and MeCN) gave lower yields. The configuration at the newly created, amino group bearing, stereogenic centre in 11a, that would become C-8a in the final target 1, was assumed to the desired one based on reports that the PBAMR normally provides 1,2-antiamino alcohol products via a boronate intermediate, similar to A, as shown in Scheme 1.^{7,8} This assumption was later confirmed to be correct in the eventual execution of the synthesis of 1. Treatment of 11a with 1.07 equivalents of methanesulfonyl chloride and 3.5 equivalents of triethylamine,^{8g} followed by warming of the O-mesylate intermediate to 40-45 °C for 4 h provided the fully substituted pyrrolidine 12a in 66% yield after separation of small amounts of O,N-dimesylated 11a and

unreacted **11a** by column chromatography. A ring-closing metathesis reaction of diene **11a** using 18 mol% Grubbs' second generation catalyst, in the presence of $Ti(O^{i}-Pr)_{4}$ (0.2 equivalents)^{8b,10} to deactivate the amino group in **11a**, gave the indolizidine **12a** in 76% yield. Hydrogenation/hydrogenolysis of **12a**, over PdCl₂/H₂^{8c} gave (–)-steviamine **1** in quantitative yield after neutralization/purification by basic ion-exchange chromatography.

The NMR spectroscopic data of synthetic **1**, matched very closely (¹H NMR 0.1 ppm consistent differences, ¹³C NMR 0.04 ppm consistent differences) to those of the natural product² (see the ESI†). Further the specific rotation of the synthetic material, $[\alpha]_D^{25}$ –23.8 (*c* 1.0, MeOH), was of the same sign and close in magnitude to that of the natural product (lit.² $[\alpha]_D^{20}$ –22 (*c* 1.0, MeOH). Thus the first synthesis of (–)-steviamine **1** has been achieved in four synthetic steps from compounds **8**, **9a** and **10**. Since compound **8** was prepared in four steps (45% overall yield (see ESI†)) from commercially available β -L-ribofuranose-1,2,3,5-tetra-*O*-acetate, this synthesis represents an eight step total synthesis of steviamine **1** from commercially available starting materials with an over yield of 17%. This concise strategy was further employed to prepare the analogues **5**, **6** and **7**.

Treatment of a mixture of 8, 4-buten-1-amine HCl 9b and 10 under the aforementioned PBAMR conditions gave the amino diol 11b as a single diastereomer in 59% yield (Scheme 1). This compound was converted to 10-nor-steviamine 5, in an analogues fashion, in 30% overall yield (Scheme 1). While this compound had a specific rotation of $\left[\alpha\right]_{\mathrm{D}}^{25}$ -7.7 (c 1.0, H₂O), similar to that reported in the literature $([\alpha]_{D}^{25} - 8.7 (c \ 1.2, \ H_2O))^5$ there were significant differences in the ¹H NMR spectral data recorded in D_2O (see ESI[†]). The most significant difference was the relative chemical shifts for the protons H-1 and H-9a and H-9b in the range of $\delta \sim 3.8$ –3.9. In our sample the H9 protons were observed as dd resonances (J = 12.0, 5.0-5.5 Hz) at δ 3.87 and δ 3.81 while the H-1 resonance at δ 3.82 (apparent t, J = 6.0 Hz) was observed at a chemical shift in between those of the two H-9 resonances. The literature, however, reported the H9 protons as dd resonances (I = 12.2, 5.0-5.5 Hz) at δ 3.83 and δ 3.77 with the H-1 signal being the most downfield of this group at δ 3.87 (apparent t, J = 5.5 Hz). Further, H-8a resonated at δ 2.67–2.72 (m) in our sample while the literature value for the chemical shift of this proton was δ 2.97 (s). The ¹³C NMR chemical shifts were also significantly different with chemical shift differences varying from -1.9 to 0.2 ppm (see ESI⁺). Since NOESY and ROESY NMR experiments on our sample of 5 were not unequivocal in defining the stereochemistry of our compound, because of the closeness of the individual resonances, and because the NMR chemical shifts of these types of polyhydroxylated compounds in D_2O can vary with pH and concentration,^{8d,f} we prepared 14, the triacetate derivative of 5 (Scheme 1). ROESY NMR experiments in CDCl₃ clearly indicated the assigned stereochemistry of 14. Significant cross peaks were observed between H-8a and both H-5β and H-9, which clearly supported the relative synstereochemical relationship between these three protons (Fig. 2).

Fig. 2 Significant ROESY cross-peaks of compound 14 (SPARTAN generated structure using a DFT calculation (B3LYP/6-31G** level)).

Scheme 2 Synthesis of 5-epi-ent-steviamine 7, 10-nor-ent-steviamine 6 and its triacetate derivative 19.

For the synthesis of 5-*epi-ent*-steviamine 7 the known D- β -ribofuranose derivative **15**⁹ ((3*R*,4*S*,5*R*)-4-(benzyloxy)-5-(benzyloxymethyl)tetrahydrofuran-2,3-diol) was treated with (*R*)-4-penten-2-amine-HCl **9a**, triethylamine and *E*-styrylboronic acid **10** in ethanol solution at rt for 4 d to give the amino diol **16a** in 82% yield (Scheme 2). This compound was readily converted to 5-*epi-ent*-steviamine 7 in three efficient steps according to the protocols developed in Scheme 1. The overall yield of 7 was 38% from **15** or 24% from D- β -ribofuranose. The NMR spectroscopic data of 7 agreed well with those reported² (see ESI†), the specific rotation of 7 ($[\alpha]_D^{25}$ –4.6 (*c* 1.0, MeOH)) was of the same sign and of similar low magnitude to that reported ($[\alpha]_D^{20}$ –1.2 (*c* 1.0, MeOH)).²

10-Nor-*ent*-steviamine 6 and its triacetate derivative 19 were prepared in an analogous fashion from 15 (Scheme 2). The

NMR spectroscopic data of **5** and **6** and those of **14** and **19** were identical, allowing for slight spectrometer variations. While the optical rotations of **5** and **6** were opposite in sign they varied significantly in magnitude (see Experimental section), however those of compounds **14** and **19**, which could be purified on silica gel using organic solvents, were essentially equal and opposite in sign (**14**: $[\alpha]_D^{25} +9.4$ (*c* 0.2, CHCl₃); **19**: $[\alpha]_D^{25} -9.2$ (*c* 0.2, CHCl₃)). These results suggested that the samples of **5** or **6** may be different hydrates resulting in incorrect mass measurements. Repeated purifications of these samples did not provide more closely matching specific rotations.

Glycosidase inhibition studies

The results of our glycosidase inhibitor testing for (-)-steviamine 1, its analogues 5-7 and swainsonine 2, ent-2 and castanosperimine 3 against twelve glycosidases are shown in Table 1. These mean % inhibition tests were determined for each compound at 143 $\mu g m L^{-1}$ according to previously published protocols.¹¹ In general compounds 1 and 5-7 were found to have poor inhibitory activity against most enzymes. None were as active as (-)-swainsonine 2 against α -L-rhamnosidase (from Penicillium decumbens) or (+)-swainsonine (ent-2) against α-D-mannosidase (from Jack bean) or castanosperimine 3 against α-D-glycosidase (from Bacillus sterothermophi*lus*) and almond β -D-glycosidase. The 10-*nor* analogues, 5 and 6, however, showed 50–54% inhibition of α -L-rhamnosidase from Penicillium decumbens while 10-nor-steviamine 5, showed 51% inhibition of N-acetyl-β-D-glucosaminidase (from bovine kidney) at the same concentration (760 μ M). It is interesting that the enantiomeric compounds 5 and 6 give almost equal inhibition of α -L-rhamnosidase whereas 7, with the extra methyl group, is a much weaker inhibitor. Both 5 and 6 have two equivalent hydroxyls to ent-swainsonine (ent-2) and swainsonine 2, respectively and yet they both follow ent-swainsonine in inhibition of α -L-rhamnosidase and not α -mannosidase. (-)-Steviamine 1 does not show significant inhibition of any glycosidase tested; it could be that it has a biological function in the source plant inhibiting a glycosidase we have not tested against or it is clear that iminosugars can be functional without glycosidase inhibition and in fact this lack of glycosidase inhibition (or high selectivity) may make them more suitable as pharmaceutical products.¹²

Interestingly, all compounds appeared to promote the activities of certain enzymes. In particular, compounds **1** and **6** seemed to significantly promote the activity of α -*D*-glucosidase (from *Bacillus sterothermophilus*). This promotion of activity could be due to enzyme stabilisation or improved folding of the enzyme *via* non-catalytic site binding.

The inhibitory activity of compound 5, which was prepared previously,⁵ and had different NMR properties to ours, was reported to have no inhibitory activity against two α -D-glucosidases (from Baker's yeast and rice), one β -D-glucosidase (from sweet almonds) and a β -D-galactosidase (from bovine liver). These results are consistent with our results shown in Table 1. The earlier report showed that compound 5 was a more

significant inhibitor of α -L-rhamnosidase (from *Penicillium decumbens*, IC₅₀ 35 μ M)) and α -D-mannosidase (from Jack bean, IC₅₀ 82 μ M)) and a significantly weaker inhibitor of α -L-fucosidase (from bovine kidney, IC₅₀ 593 μ M)). Our compound 5 also showed some, although very weak, activity against α -D-mannosidase (from Jack bean, only 31% inhibition at 708, μ M Table 1) and an IC₅₀ of approximately 708 μ M (53% inhibition) against the α -L-rhamnosidase from *Penicillium decumbens*.

Conclusions

In conclusion, a concise and efficient four step synthesis of natural (-)-steviamine 1 has been developed from the readily accessible L-β-ribofuranose derivative 8. This synthetic protocol involves a highly anti-selective Petasis reaction, and efficient ring-closing metathesis and O-mesylate cyclization reactions to prepare the piperidine and pyrrolidine rings, respectively. This synthetic protocol allowed for the synthesis of the (-)-steviamine analogues 10-nor-steviamine, 10-nor-ent-steviamine and 5-epi-ent-steviamine. These compounds were tested against twelve glycosidases (at 143 µg mL⁻¹ concentrations) and were found in general to have poor inhibitory activity against most enzymes. The 10-nor analogues however, showed 50-54% inhibition of α-L-rhamnosidase from Penicillium decumbens while one of these, 10-nor-steviamine, showed 51% inhibition of N-acetyl-β-D-glucosaminidase (from bovine kidney) at the same concentration (457 µM).

Experimental section

General information

All reagents were used as received from commercial sources without further purification. Solvents were purchased as Analytical Reagents (AR) grade. Petrol refers to the hydrocarbon fraction of bp 40–60 °C. Tetrahydrofuran was stored over KOH pellets until needed, then distilled over sodium wire under nitrogen, using benzophenone as indicator. Anhydrous CH_2Cl_2 and MeOH were purchased from Aldrich. Reactions were stirred using Teflon-coated magnetic stirring bars.

Analytical TLC was performed with aluminium backed Merck F254 sorbent silica gel. TLC plates were visualized by ultraviolet light or by treatment with acidified, aqueous solution of ammonium molybdate and cerium(IV) sulfate, followed by development with a 1400 Watt heat gun. Chromatographic purification of products was carried out by flash column chromatography on silica gel (70-230 mesh). Basic ionexchange chromatography was performed using Amberlyst A-26(OH) resin. Infrared spectra were recorded as neat samples on a MIRacle 10 Shimadzu Spectrophotometer. NMR spectra were measured in CDCl3 (with TMS as internal standard) or D₂O (with MeOH as internal standard) on a Varian VNMRS PS54-500 or a Varian INOVA-500 (¹H at 500 MHz, ¹³C at 125 MHz) magnetic resonance spectrometer. Chemical shifts (δ) are reported in ppm, and coupling constants (*J*) are in Hz. The following abbreviations were used to explain the multiplicities: s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet. Low-resolution mass spectra were obtained on a Waters LCZ single quadrupole (ESI+). High-resolution mass spectra (HRMS) were recorded on a Waters OTOF (ESI+), a Waters Xevo (ESI+) or a Waters Xevo (ASAP). Polarimetry was carried out using a JASCO P-2000 Digital Polarimeter and the measurements were made at the sodium D-line with a 1 dm path length cell. Concentrations (c) are given in grams per 100 mL.

(2S,3R,4R,E)-1,3-Bis(benzyloxy)-5-((R)-pent-4-en-2-ylamino)-7-phenylhept-6-ene-2,4-diol (11a). To a solution of 8 (1.00 g, 3.03 mmol, see ESI⁺ for synthesis details) in absolute ethanol (25 mL) was added (R)-pent-4-en-2-amine-hydrochloride 9a (368 mg, 3.03 mmol, a commercial sample from NetChem, Inc. USA, >95% ee, $[\alpha]_{D}^{25}$ +4.0 (*c* 1.0, EtOH)) followed by Et₃N (0.42 mL, 3.03 mmol) and *trans*-2-phenylvinyl boronic acid (10) (448 mg, 3.03 mmol, commercial sample from Aldrich). The mixture was stirred at rt for 4 d, followed by the evaporation of all volatiles in vacuo. The residue was dissolved in CH₂Cl₂ (10 mL) and washed with sat. aq. NaHCO₃ (2 \times 10 mL). The organic layer was dried (MgSO₄), filtered and concentrated in vacuo to afford a brown foam. Purification by flash column chromatography (increasing polarity from 0:100 to 20:80 MeOH– CH_2Cl_2 as eluent) afforded the title compound (1.16 g, 77%) as a yellow foam. $R_{\rm f}$ 0.48 (10:90 MeOH-CH₂Cl₂). $[\alpha]_{D}^{25}$ +47.9 (c 2.0, CHCl₃). ((1*R*,2*S*,3*R*,5*R*,8a*R*)-2-(Benzyloxy)-3-(benzyloxymethyl)-5-methyl-1,2,3,5,6,8a-hexahydroindolizin-1-ol (13a). To a solution of 12a (490.7 mg, 1.02 mmol) in anhydrous CH_2Cl_2 (36 mL) was added *via* syringe a solution of $Ti(O^i-Pr)_4$ (0.06 mL, 0.203 mmol) in anhydrous CH_2Cl_2 (11 mL). The above solution was stirred at rt for 0.5 h, then added Grubbs II catalyst (155.3 mg, 0.183 mmol). The reaction mixture was heated at reflux at 45 °C for 2.5 h, when TLC analysis showed complete consumption of **12a**. The reaction mixture was then diluted with CH_2Cl_2 (125 mL) and washed with sat. aq. NaHCO₃ (87 mL). The aqueous layer was further extracted with CH_2Cl_2 (125 mL). The organic layers were dried (MgSO₄) and concentrated *in vacuo* to afford a dark brown oil as a crude product. Purification by flash column chromatography (increasing polarity from 50 : 50 to 0 : 100 petrol–EtOAc as eluent) afforded the title compound (294 mg, 76%) as a brown oil. $R_{\rm f}$ 0.28 (1 : 4 petrol–EtOAc). $[\alpha]_{\rm D}^{25}$ +38.6 (c 1.4, CHCl₃). IR (cm⁻¹): 3382, 3015, 2928, 2874, 2316, 1496, 1451, 1152, 1055. ¹H NMR (500 MHz, CDCl₃) δ 7.34–7.21 (m, 10H), 5.79–5.76 (m, 1H), 5.53 (d, J = 10.5 Hz, 1H), 4.93 (d, J = 9.5 Hz, 1H), 4.71, 4.45 (AB_q, $J_{\rm AB}$ = 11.5 Hz, 2H), 4.69, 4.54 (AB_q, $J_{\rm AB}$ = 12.0 Hz, 2H), 4.12 (dd, J = 9.5, 4.5 Hz, 1H), 3.97 (dd, J = 9.5, 4.5 Hz, 1H), 3.91 (brs, 1H), 3.58 (d, J = 9.0 Hz, 1H), 3.41 (dd, J = 9.5, 3.0 Hz, 1H), 3.34 (brd, J = 9.5 Hz, 1H), 1.17 (d, J = 7.0 Hz, 3H). ¹³C NMR (125 MHz, CDCl₃) δ 138.4, 137.5, 129.1, 128.4, 128.3, 128.2, 127.8, 127.6, 127.7, 78.2, 74.0, 71.5, 71.5, 70.6, 66.7, 55.7, 50.6, 26.1, 21.3. MS (ESI +ve) m/z 380.2 (M + H⁺, 100%). HRMS (ESI +ve) calculated for C₂₄H₃₀NO₃ (M + H⁺) 380.2226, found 380.2214.

(1*R*,2*S*,3*R*,5*R*,8*aR*)-3-(Hydroxymethyl)-5-methyloctahydroindolizine-1,2-diol((–)-steviamine) (1). To a solution of 13a (183.5 mg, 0.484 mmol) in MeOH (10 mL) was added PdCl₂ (171.5 mg, 0.967 mmol). The mixture was stirred at rt under an atmosphere of H₂ (balloon) for 3 h. The mixture was filtered through a pad of Celite and the solids were washed with MeOH. The combined filtrates were evaporated *in vacuo* and the residue was dissolved in water (10 mL) and applied to a column of Amberlyst A-26 (OH⁻) resin (3 cm). Elution with water followed by evaporation *in vacuo* afforded the title compound (98.0 mg, 100%) as a brown oil. $[\alpha]_D^{25}$ –23.8 (*c* 1.0, MeOH) (lit.² $[\alpha]_D^{25}$ –22.0 (*c* 1.0, MeOH)). IR (cm⁻¹): 3329, 2929, 2855, 1631, 1441, 1379, 1315, 1214, 1137, 1097, 1079, 1036, 1006.

¹H NMR (500 MHz, D₂O) δ 4.33 (t, J = 7.5 Hz, 1H, H-2), 3.96 (dd, J = 12.5, 5.5 Hz, 1H, H-9), 3.91 (dd, J = 12.0, 3.5 Hz, 1H, H-9'), 3.80 (t, J = 7.0 Hz, 1H, H-1), 3.52 (dd, J = 9.5, 6.5 Hz, 1H, H-3), 2.85–2.82 (m, 1H, H-5), 2.67–2.64 (m, 1H, H-8a), 2.00 (brd, J = 12.5 Hz, 1H, H-8), 1.81 (brd, J = 13.0 Hz, 1H, H-7), 1.74 (brd, J = 13.0 Hz, 1H, H-6), 1.42–1.34 (m, 1H, H-7), 1.21–1.12 (m^a, 5H, H-6', H-8' and CH₃) [^a = overlapping of signals]. ¹³C NMR (125 MHz, D₂O) δ 74.1 (C-1), 69.3 (C-2), 66.9 (C-8a), 61.5 (C-3), 56.7 (C-9), 52.8 (C-5), 33.6 (C-6), 29.5 (C-8), 23.9 (C-7), 19.4 (CH₃). MS (ESI +ve) m/z 202.0 (M + H⁺, 100%). HRMS (ESI +ve) calculated for C₁₀H₂₀NO₃ (M + H⁺) 202.1443, found 202.1465.

((2S,3R,4R,E)-1,3-Bis(benzyloxy)-5-(but-3-enylamino)-7-phenylhept-6-ene-2,4-diol (11b) and its enantiomer 16b. To a solution of 8 (30.4 mg, 0.09 mmol) in absolute EtOH (0.75 mL) was added 3-butenylamine.hydrochloride (9b) (9.7 mg, 0.09 mmol) followed by Et₃N (0.013 mL, 0.09 mmol) and trans-2-phenylvinyl boronic acid (10) (13.3 mg, 0.09 mmol). The mixture was stirred at rt for 4 d, followed by the evaporation of all volatiles in vacuo. The residue was dissolved in CH₂Cl₂ (4 mL) and washed with sat. aq. NaHCO₃ (2×4 mL). The organic layer was dried (MgSO₄), filtered and concentrated in vacuo to afford a brown foam. Purification by flash column chromatography (increasing polarity from 0:100 to 20:80 MeOH-CH2Cl2 as eluent) afforded the title compound (26.3 mg, 59%) as a brown foam. $R_{\rm f}$ 0.45 (10:90 MeOH-CH₂Cl₂). $[\alpha]_{\rm D}^{25}$ +51.5 (c 1.3, $CHCl_3$). IR (cm⁻¹): 3376, 3029, 1452, 1088, 1072, 1028. ¹H NMR (500 MHz, CDCl₃) δ 7.39–7.19 (m, 15H), 6.51 (d,

J = 16.0 Hz, 1H), 6.23 (dd, *J* = 16.0, 9.0, 1H), 5.77–5.67 (m, 1H), 5.07 (d, *J* = 18.0 Hz, 1H), 5.03 (d, *J* = 10.5 Hz, 1H), 4.64, 4.56 (ABq, *J*_{AB} = 12.5 Hz, 2H), 4.55, 4.47 (ABq, *J*_{AB} = 11.5 Hz, 2H), 4.04–4.00 (m^a, 2H), 3.75–3.68 (m^a, 3H), 3.65 (dd, *J* = 7.0, 4.5 Hz, 1H), 2.76–2.71 (m, 1H), 2.60–2.55 (m, 1H), 2.26 (q, *J* = 7.0 Hz, 2H) [^a = overlapping of signals]. ¹³C NMR (125 MHz, CDCl₃) δ 138.5, 138.0, 136.4, 135.7, 134.6, 128.8, 128.5, 128.1, 128.0, 127.9, 127.7, 126.8, 126.8, 117.1, 79.7, 73.8, 73.5, 72.9, 71.7, 68.8, 62.8, 46.0, 33.8. MS (ESI +ve) *m*/*z* 488.5 (M + H⁺, 100%). HRMS (ESI +ve) calculated for C₃₁H₃₈NO₄ (M + H⁺) 488.2801, found 488.2784.

Its enantiomer (**16b**) was prepared as described above using **15** (see ESI[†] for syntheses details) as a starting material (0.605 mmol scale). Compound **16b** was obtained as a brown foam (167.9 mg, 57%). $[\alpha]_{\rm D}^{25}$ –58.7 (*c* 1.0, CHCl₃).

(2R,3R,4S,5R)-4-(Benzyloxy)-5-(benzyloxymethyl)-1-(but-3-enyl)-2-styrylpyrrolidin-3-ol (12b) and its enantiomer 17b. To a solution of 11b (80.0 mg, 0.1641 mmol) in anhydrous CH2Cl2 (9 mL) at 0 °C was added Et₃N (0.023 mL, 0.164 mmol) under an atmosphere of N_2 . The mixture was then cooled to -10 °C followed by the addition of a 0.13 M solution of methanesulfonyl chloride in anhydrous CH2Cl2 (1.51 mL, 0.197 mmol MeSO₂Cl). After complete addition the reaction mixture was gradually warmed to 40 °C over 3 h and stirred for further 30 min under gentle reflux. The solution was subsequently concentrated in vacuo to afford a brown oil. Purification by flash column chromatography (increasing polarity from 10:90 to 20:80 EtOAc-petrol and 20:80 MeOH-CH₂Cl₂ as eluent) afforded the title compound (63.9 mg, 83%) as a yellow oil. $R_{\rm f}$ 0.52 (3:7 EtOAc-petrol). $\left[\alpha\right]_{\rm D}^{25}$ -18.2 (c 0.7, CHCl₃). MS (ESI +ve) m/z 470.4 (M + H⁺, 100%). HRMS (ESI +ve) calculated for $C_{31}H_{36}NO_3$ (M + H⁺) 470.2695, found 470.2674. (2S,3S,4R,5S)-4-(Benzyloxy)-5-(benzyloxymethyl)-1-((*R*)-pent-4-en-2-yl)-2-styrylpyrrolidin-3-ol (17a). To a solution of 16a (241 mg, 0.481 mmol) in anhydrous CH₂Cl₂ (1.6 mL) at 0 °C

was added Et₃N (0.23 mL, 1.68 mmol) under an atmosphere of N₂. The mixture was then cooled to -10 °C followed by the addition of a 0.13 M solution of methanesulfonyl chloride in anhydrous CH₂Cl₂ (4.10 mL, 0.529 mmol MeSO₂Cl). After complete addition the reaction mixture was gradually warmed to 40 °C over 3 h and stirred for further 30 min under gentle reflux. The solution was subsequently concentrated in vacuo to afford a brown oil. Purification by flash column chromatography (increasing polarity from 10:90 to 20:80 EtOAc-petrol and 20:80 MeOH-CH₂Cl₂ as eluent) afforded the title compound (161 mg, 69%) as a brown oil. Rf 0.62 (3:7 EtOAcpetrol). $\left[\alpha\right]_{D}^{25}$ +20.0 (c 0.5 CHCl₃). IR (cm⁻¹): 3384, 3062, 3028, 2931, 2869, 1725, 1640, 1495, 1452, 1174, 1140, 1087, 1054, 1026. ¹H NMR (500 MHz, CDCl₃) δ 7.37-7.20 (m, 15H), 6.51 (d, J = 16.5 Hz, 1H), 5.98 (dd, J = 16.0, 9.0 Hz, 1H), 5.81–5.72 (m, 1H), 4.97 (d, J = 15.5 Hz, 1H), 4.95 (d, J =11.5 Hz, 1H), 4.77, 4.49 (AB_q, J_{AB} = 12.0 Hz, 2H), 4.71 (d, J = 10.0 Hz, 1H), 4.61, 4.57 (AB_q, J_{AB} = 11.5 Hz, 2H), 4.19 (dd, J = 8.0, 5.5 Hz, 1H), 3.99 (dd, J = 8.0, 6.5 Hz, 1H), 3.91 (d, J = 9.0 Hz, 1H), 3.62-3.54 (m^a, 3H), 3.06-2.99 (m, 1H), 2.43-2.38 (m, 1H), 1.98–1.92 (m, 1H), 1.12 (d, J = 7.0 Hz, 1H) [^a indicates the overlapping of signals]. ¹³C NMR (125 MHz, CDCl₃) δ 138.5, 137.5, 137.3, 137.3, 132.5, 130.6, 128.7, 128.6, 128.5, 128.0, 127.9, 127.7, 127.5, 126.4, 116.0, 77.8, 74.9, 73.8, 71.5, 70.5, 68.1, 59.8, 52.1, 40.4, 18.5. MS (ESI +ve) m/z 484.3 (M + H⁺, 100%). HRMS (ESI +ve) calculated for $C_{32}H_{38}NO_3$ $(M + H^{+})$ 484.2852, found 484.2837.

(1S,2R,3S,5R,8aS)-2-(Benzyloxy)-3-(benzyloxymethyl)-5-methyl-1,2,3,5,6,8a-hexahydroindolizin-1-ol (18a). To a solution of 17a (62.5 mg, 0.129 mmol) in anhydrous CH_2Cl_2 (4.4 mL) was added via syringe a solution of Ti(Oⁱ-Pr)₄ (0.008 mL, 0.026 mmol) in anhydrous CH₂Cl₂ (1.5 mL). The above solution was stirred at rt for 0.5 h, then Grubbs II catalyst was added (19.8 mg, 0.023 mmol). The reaction mixture was heated at reflux at 45 °C for 2.5 h, when TLC analysis showed complete consumption of 17a. The reaction mixture was then diluted with CH₂Cl₂ (16 mL) and washed with sat. aq. NaHCO₃ (11 mL). The aqueous layer was further extracted with CH_2Cl_2 (16 mL). The organic layers were dried (MgSO₄) and concentrated in vacuo to afford a dark brown oil. Purification by flash column chromatography (increasing polarity from 20:80 to 10:90 petrol-EtOAc as eluent) afforded the title compound (23.8 mg, 83%) as a brown oil. $R_{\rm f}$ 0.28 (1:4 EtOAc-petrol). $[\alpha]_{\rm D}^{25}$ -7.7 (c 0.9, CHCl₃). IR (cm⁻¹): 3376, 3030, 2925, 2869, 2358, 1636, 1453, 1375, 1265, 1207, 1087, 1060, 1027. ¹H NMR (500 MHz, CDCl₃) δ 7.36-7.25 (m, 10H), 5.73-5.70 (m, 1H), 5.60 (dd, J = 10.0, 1.0 Hz, 1H), 4.68, 4.57 (AB_q, J_{AB} = 12.0 Hz, 2H), 4.68, 4.60 (AB_q, J_{AB} = 12.0 Hz, 2H), 4.13 (dd, J = 8.0, 4.0 Hz, 1H), 3.96 (brs, 1H), 3.71 (brs, 1H), 3.63 (dd, J = 9.5, 5.0 Hz, 1H), 3.55 (brd, J = 8.5 Hz, 1H), 3.25-3.21 (m, 1H), 3.04 (brs, 1H), 2.37–2.32 (m, 1H), 1.63 (m, 1H), 1.18 (d, J = 7.0 Hz, 3H). 13 C NMR (125 MHz, CDCl₃) δ 138.4, 138.2, 128.5, 128.4, 127.9, 127.8, 127.7, 125.3, 78.4, 73.8, 73.2, 72.6, 69.3, 62.3, 60.6, 48.8, 25.6, 20.0. MS (ESI +ve) m/z 380.2 (M + H⁺, 100%). HRMS (ESI +ve) calculated for $C_{24}H_{30}NO_3$ (M + H⁺) 380.2226, found 380.2227.

(1S,2R,3S,5R,8aS)-3-(Hydroxymethyl)-5-methyloctahydroindolizine-1,2-diol (7). To a solution of 18a (37.0 mg, 0.098 mmol) in MeOH (2 mL) was added PdCl₂ (34.6 mg, 0.195 mmol). The mixture was stirred at rt under an atmosphere of H₂ (balloon) for 3 h. The mixture was filtered through a pad of Celite and the solids were washed with MeOH. The combined filtrates were evaporated in vacuo and the residue was dissolved in water (1.5 mL) and applied to a column of Amberlyst A-26 (OH⁻) resin (3 cm). Elution with water followed by evaporation in vacuo afforded the title compound (19.6 mg, 100.0%) as a brown oil. $[\alpha]_{D}^{25}$ -4.6 (*c* 1.0, MeOH), lit.⁴ $[\alpha]_{D}^{25}$ -1.2 (c 1.0, MeOH). IR (cm⁻¹): 3352, 2931, 2863, 1629, 1596, 1455, 1381, 1339, 1121, 1096, 1059, 1028. ¹H NMR (500 MHz, D₂O) δ 4.37 (t, I = 6.0 Hz, 1H, H-2), 4.09 (dd, I =10.5, 5.5 Hz, 1H, H-1), 3.77 (dd, J = 11.0, 9.5 Hz, 1H, H-9), 3.60 (dd, J = 11.0, 5.5 Hz, 1H, H-9'), 3.29-3.25 (m, 1H, H-3), 3.00-2.97 (m, 1H, H-8a), 2.55-2.51 (m, 1H, H-5), 1.77-1.75 (m, 1H, H-8), 1.71-1.63 (m^a, 2H, H-6, H-8'), 1.56-1.52 (m, 1H, H-7), 1.45-1.37 (m, 1H, H-7'), 1.16-1.08 (m, 1H, H-6'), 1.02 (d, J = 6.0 Hz, 3H, CH₃) [^a indicates the overlapping of signals]. ¹³C NMR (125 MHz, D_2O) δ 70.6 (C-1), 69.8 (C-2), 66.2 (C-3), 60.4 (C-9), 58.5 (C-8a), 55.1 (C-5), 32.0 (C-6), 22.7 (C-8), 20.4 (CH₃), 18.1 (C-7). MS (ESI +ve) m/z 202.1 (M + H⁺, 100%). HRMS (ESI +ve) calculated for $C_{10}H_{20}NO_3$ (M + H⁺) 202.1443, found 202.1450.

Glycosidase inhibition assay¹¹

All enzymes and para-nitrophenyl substrates were purchased from Sigma, with the exception of β -mannosidase which came from Megazyme. Enzymes were assayed at 27 °C in 0.1 M citric acid/0.2 M disodium hydrogen phosphate buffers at the optimum pH for the enzyme. The incubation mixture consisted of 10 μ L enzyme solution, 10 μ L of 1 mg mL⁻¹ aqueous solution of test compound and 50 µL of the appropriate 5 mM para-nitrophenyl substrate made up in buffer at the optimum pH for the enzyme. The reactions were stopped by addition of 70 µL 0.4 M glycine (pH 10.4) during the exponential phase of the reaction, which had been determined at the beginning using uninhibited assays in which water replaced inhibitor. Final absorbances were read at 405 nm using a Versamax microplate reader (Molecular Devices). Assays were carried out in triplicate, and the values given are means of the three replicates per assay.
