# Iodine-induced synthesis of sulfonate esters from sodium sulfinates and phenols under mild conditions†

Jian Gao, Xiaojun Pan, Juan Liu, Junyi Lai, Liming Chang and Gaoqing Yuan\*

An iodine-induced synthesis of sulfonate esters *via* cross-coupling reactions of sodium sulfinates with phenols is reported. This synthetic route is low-cost, facile, green and efficient, and could afford the target products with good to excellent yields under mild conditions.

Sulfonate esters are well-known ester compounds and crucial pharmaceutical ingredients which work as bridge structures or ligands and have presented particular biological activities (such as antitumor and monoamine oxidase inhibitory activities) in medicinal chemistry (Fig. 1).<sup>1–4</sup> Besides, sulfonate esters play a unique role in coupling reactions because sulfonate ester groups are removed easily.<sup>5</sup> To date, many methods have been developed to synthesize sulfonate esters, mainly including the reaction of phenols with sulfonic acids,<sup>6</sup> or with thiols using H<sub>2</sub>O<sub>2</sub>–POCl<sub>3</sub> system,<sup>7</sup> and with sulfonyl chlorides in ionic liquids,<sup>8</sup> or under microwave-assistance<sup>9</sup> and catalyzed by copper oxide.<sup>10</sup> Other routes have been also reported.<sup>11</sup> Nevertheless, most of these methods suffer from harsh reaction conditions. In addition, expensive and unstable sulfonyl chlorides as sulfonylating reagents would lead to some drawbacks. Hence, it is necessary to search for low-cost, green and efficient sulfonylating reagents (sulfonyl sources) for the synthesis of sulfonate esters.

In recent years, many chemists became interested in the direct sulfonylation reaction using various sulfonylation reagents.<sup>12</sup> Among various sulfonylation reagents, sodium sulfinates seem to be more attractive due to their stability, low price and convenience handling. Actually, sodium sulfinates have been widely applied in sulfonylations,<sup>13</sup> C–H arylations<sup>14</sup> and sulfonylations.<sup>15</sup> In addition, iodine-mediated synthesis has attracted more and more attention because iodine is cheap,

readily available and eco-friendly.<sup>16</sup> Recently, some interesting reactions related phenols in organic chemistry have been also reported.<sup>17</sup>

Based on our research interest in iodine-mediated reactions,<sup>18</sup> herein we reported an iodine-induced the synthesis of sulfonate esters from sodium sulfinates and phenols under mild conditions. To our knowledge, such a route for the synthesis of sulfonate esters has not been reported to date.

To optimize the reaction conditions, the reaction of 4-chlorophenol (**1a**) with sodium *p*-toluenesulfonate (**2a**) was selected as the model reaction, and the results were shown in Table 1. When the reaction of **1a** and **2a** was carried out in the presence of I<sub>2</sub> in CH<sub>3</sub>CN for 5 h, the yield of 4-chlorophenyl 4-methylbenzenesulfonate (**3a**) was only 10% (entry 1). Pinhey's investigations indicated that base additives could efficiently promote the coupling reaction of phenols with aryllead triacetates.<sup>19</sup> Based on this idea, we suppose that base may act as the similar role in the present system. Thus, we examined the effect of various inorganic and organic bases on the coupling reaction of 4-chlorophenol with sodium *p*-toluenesulfonate. In the presence of CH<sub>3</sub>COONa, the yield of **3a** was raised to 36% (entry 2). Very pleasedly, Cs<sub>2</sub>CO<sub>3</sub>, especially K<sub>2</sub>CO<sub>3</sub>, could dramatically improve the yield of **3a** (entries 3 and 4). However, a strong

18 <sup>h</sup>	K <sub>2</sub> CO <sub>3</sub>	CH <sub>3</sub> OH	5	90
19 <sup>i</sup>	K <sub>2</sub> CO <sub>3</sub>	CH <sub>3</sub> OH	5	88

<sup>a</sup> Reaction conditions: **1a** (0.5 mmol), **2a** (0.6 mmol), I<sub>2</sub> (1 equiv.), base (1 equiv.), solvent (2 mL) and room temperature. <sup>b</sup> GC yield based on **1a**. <sup>c</sup> At 50 °C. <sup>d</sup> Reaction in a dark background. <sup>e</sup> Adding TEMPO. <sup>f</sup> Adding BHT. <sup>g</sup> Using tosyl iodide (0.6 mmol) instead of **2a** and I<sub>2</sub>. <sup>h</sup> Under N<sub>2</sub> atmosphere. <sup>i</sup> Reaction on a 10 mmol scale.

inorganic base KOH and organic bases (Et<sub>3</sub>N and pyridine) gave unsatisfactory results (entries 5–7). The effect of solvents were further investigated. Compared with other solvents (H<sub>2</sub>O, DMF, EtOH and DMSO), CH<sub>3</sub>CN or CH<sub>3</sub>OH gave the better results (entries 8–12). Considering the toxicity of CH<sub>3</sub>CN, we chose CH<sub>3</sub>OH as the solvent for this transformation. When the temperature was elevated to 50 °C, the yield of **3a** was not influenced (entry 13), so room temperature was found as the optimal temperature. In addition, the amount of I<sub>2</sub> and K<sub>2</sub>CO<sub>3</sub> has a great influence on the reaction (see ESI†). When 1 equiv. of I<sub>2</sub> or K<sub>2</sub>CO<sub>3</sub> was used in the present system, the best result could be obtained (entry 8). Moreover, when the reaction was performed on a 10.0 mmol scale (Table 1, entry 19), an excellent yield (88%) of **3a** was obtained. This means that the reaction could be scalable and has a potential application for the preparation of more complex molecules.

Under the optimized reaction conditions, the scope of synthesis of sulfonate esters by using various phenols with **2a** was investigated (Table 2). A series of *ortho* and *para*-substituted phenols by electron-withdrawing groups (R = F, Br, I, NO<sub>2</sub>, CN) all proceeded smoothly to afford the corresponding products (**3d–3f**, **3i–3k**) in excellent yields. However, when some electron-donating groups (R = CH<sub>3</sub>, isopropyl) substituted phenols were used, a long reaction time was needed, a lower yield was obtained, and some by-products substituted by iodine were observed (**3c**, **3g**, **3h**, **3l**). This result may be attributed to the fact

<sup>a</sup> Reaction conditions: **1** (0.5 mmol), **2a** (0.6 mmol), I<sub>2</sub> (0.5 mmol), K<sub>2</sub>CO<sub>3</sub> (1 equiv.), CH<sub>3</sub>OH (2 mL), room temperature. <sup>b</sup> Isolated yield based on **1**. <sup>c</sup> CH<sub>3</sub>CN (2 mL) as the solvent. <sup>d</sup> Using CH<sub>3</sub>ONa (0.5 mmol) instead of K<sub>2</sub>CO<sub>3</sub>.

that the presence of electron-donating groups is not favourable for the conversion of phenols to aryloxy anion. In the present reaction system, the aryloxy anion may be one of key intermediates. To our delight, naphthol and quinolin-8-ol performed with good yields (**3m–3o**). Specially, aliphatic alcohols could react well with sodium *p*-toluenesulfonate (**2a**) in CH<sub>3</sub>CN solvent to afford the target products (**3p–3r**) with good yields when K<sub>2</sub>CO<sub>3</sub> was replaced by CH<sub>3</sub>ONa. These results indicate that aliphatic alcohols are also suitable for this transformation in the presence of a strong base CH<sub>3</sub>ONa.

On the other hand, the reactions of some sodium sulfinates with **1a** were examined, and the result was summarized in Table 3. Various sodium sulfinates with 4-fluoro, 4-chloro, 4-bromo, 4-methoxy and 4-ethyl groups substituted on aryl rings all proceeded smoothly to give good to excellent yields (**3s–3x**). In addition, 4-chlorophenylphenylmethane sulfonate (**3y**) was also obtained in a high yield.

To investigate the reaction mechanism, several controlled experiments were performed (Table 1, entries 14–18). Firstly, when radical scavenger TEMPO or BHT was added to this reaction system (Table 1, entries 15 and 16), no desired **3a** was obtained, indicating that the reaction involves a radical pathway. Besides, when the reaction of tosyl iodide instead of molecule iodine with **2a** was carried out (Table 1, entry 17), **3a** was still obtained in a high yield, revealing that tosyl iodide may be an intermediate in this transformation. Even if the reaction was proceeded in a dark background or under N<sub>2</sub> atmosphere, the yield of **3a** was almost unchanged (Table 1, entries 14 and 18). This means that visible light and oxygen were irrelevant for this transformation. As a result, a possible mechanism is

<sup>a</sup> Reaction conditions: **1a** (0.5 mmol), sodium sulfinate (0.6 mmol), **I**<sub>2</sub> (0.5 mmol), K<sub>2</sub>CO<sub>3</sub> (1 equiv.), CH<sub>3</sub>OH (2 mL), 5 h and room temperature. <sup>b</sup> Isolated yield based on sodium sulfinate.

proposed in Scheme 1. Sodium sulfinate firstly reacts with I<sub>2</sub> to form sulfonyl iodide (**A**),<sup>20</sup> which is easily subjected to homolysis to give a sulfonyl radical (**E**). At the same time, phenols is transformed to aryloxy anion (**B**) in alkaline medium. Then, the aryloxy anion **B** is combined with the radical **E** to generate the radical anion **C**, followed by the reaction with **A** to afford the desired sulfonate ester, together with radical anion **D**.<sup>21</sup> The radical anion **D** could generate the radical **E** to enter into the next reaction cycle. In the present reaction system, molecular I<sub>2</sub> practically is a reactant or an inducer, which is delineated in Scheme 2. The total reaction equation (Scheme 2) could explain well why the full conversion of 0.5 mmol of **1a** to **3a** requires 0.5 mmol of I<sub>2</sub> (see ESI, Table S1,<sup>†</sup> entry 6).

Scheme 1 Proposed reaction mechanism.

Scheme 2 A total reaction equation for this transformation.

In conclusion, we have developed a simple, metal-free and eco-friendly synthesis of sulfonate esters from sodium sulfonates and phenols. Compared with the reported methods (such as using sulfonyl chlorides as starting materials), the present route appears to be more attractive and efficient for the synthesis of sulfonate esters. Further study on this reaction's application is ongoing currently in our laboratory.
