Received 14 April 1999; accepted 11 May 1999

Abstract: The first total synthesis of a spongipyran macrolide, altohyrtin C, is described. The convergent synthesis strategy relies on a regioselective macrolactonization, a stereoselective Wittig coupling of the two major synthetic fragments, a complex *anti* aldol reaction to join the  $C_1$ - $C_{15}$  and  $C_{16}$ - $C_{28}$  spiroketal regions, and an anomeric sulfone acylation to join the  $C_{29}$ - $C_{37}$  and  $C_{38}$ - $C_{43}$  pyran regions. The incorporation of the  $C_{44}$ - $C_{51}$  sidechain in the final stages of the synthesis establishes a viable route for the construction of variants in this pharmacologically important region. Methodological developments *en route* to the total synthesis include a 1,5 *anti*-selective methyl ketone aldol reaction and a diastereoselective approach to Lewis acid mediated  $\beta$ -*C*-glycosidation. Completion of the synthesis has confirmed the stereochemical assignments proposed in the altohyrtin series and has established the identity of the altohyrtin and spongistatin marine macrolides. © 1999 Elsevier Science Ltd. Keywords: asymmetric synthesis; antitumour compounds; marine metabolites; aldol reactions

### Introduction

Since the initial reports of their isolation from marine sponges in 1993, the spongipyran macrolides have generated considerable interest in the fields of synthetic organic chemistry<sup>1</sup> and chemical biology.<sup>2</sup> Spongistatin 1 (isolated from *Spongia*),<sup>3a</sup> altohyrtin A (from *Hyrtios altum*),<sup>4a</sup> and cinachyrolide A (from *Cinachyra*)<sup>5</sup> were independently characterized by the Pettit, Kitagawa, and Fusetani groups and shown to comprise some of the most potent antitumor substances known. Against a National Cancer Institute panel of 60 highly chemoresistant tumor cell lines, spongistatin 1 exhibited IC<sub>50</sub> values in the range of 0.03 nM; similar antitumor activities were noted for altohyrtin A and cinachyrolide A. Continued efforts by the Pettit and Kitagawa groups have isolated additional spongistatins (2-9)<sup>3b-e</sup> and altohyrtins (B, C, and 5-desacetylaltohyrtin A),<sup>4b</sup> all of which demonstrate potent *in vitro* antitumor activity. Preliminary biological investigations have demonstrated that the spongistatins inhibit tubulin polymerization by binding at a site distinct from those occupied by other known inhibitors.<sup>2a</sup>

**Structure Elucidation.** The spongipyrans have been obtained from nature in minute quantities (the largest isolation yet reported yielded 14 mg of spongistatin 1 from 200 kg of *Spongia*),<sup>6</sup> and the scarcity of these natural products has prevented the unambiguous elucidation of their structures. Inspection of Figure 1 reveals that the structures proposed for the altohyrtins and spongistatins possess identical carbon connectivities and oxygenation patterns but differ with regard to internal stereochemical relationships.<sup>7</sup> Because the initial structural assignments of the natural products were based on NMR investigations, rigorous correlations of relative stereochemical assignments between subunits could not be obtained. The resulting uncertainty, in conjunction with the similar biological activities of the three families of molecules, raised the possibility that the spongistatins, altohyrtins, and cinachyrolides might all share an identical stereostructure.

Subsequent to the initial isolation reports, Kobayashi and Kitagawa have presented a convincing case for the altohyrtin structural assignment shown in Figure 1. A detailed Mosher ester analysis led to a complete absolute stereochemical proposal for the altohyrtins. This analysis was consistent with a circular dichroism exciton chirality assignment of the  $C_{47}$  sidechain stereocenter.<sup>8a,b</sup> Most recently, a restrained molecular dynamics study incorporating NMR data has corroborated the stereochemical assignment of the  $C_{14}$ - $C_{16}$  propionate region.<sup>8c</sup>

Synthesis Plan. The extensive structural assignment work of Kobayashi and Kitagawa dictated the choice of the altohyrtins as primary targets for total synthesis. The synthesis strategy was guided by three imperatives: (1) the need for a convergent approach which could be readily altered to provide antipodes of stere-ochemically controversial subunits; (2) the desirability of an efficient route which might easily access natural product analogs with potential relevance to biological studies; and (3) an emphasis on development of new reaction methodology to achieve these objectives.

The retrosynthesis initially focused on the  $C_{44}$ - $C_{51}$  sidechain as a potentially important contributor to pharmacological activity. In both the spongistatin and altohyrtin families, the identity of the substituent at  $C_{50}$  (Cl, H, or Br) appeared to significantly influence the observed IC<sub>50</sub> values.<sup>9</sup> We therefore planned to add a sidechain allyl nucleophile to an advanced F-ring epoxide intermediate (Scheme 1, transform  $T_1$  or  $T_{2a}$ ) which could be derived from the corresponding dihydropyran (transform  $T_2$  or  $T_{3a}$ ). Successful implementation of this late stage sidechain addition would allow incorporation of a variety of  $C_{44}$ - $C_{51}$  sidechains, natural or designed, into a common, fully elaborated intermediate.

The incorporation of the sidechain was intimately tied to our strategy for macrocyclization to form the 32membered spongipyran lactone (Scheme 1, transform  $T_3$  or  $T_{1a}$ ). Macrolactonization involving the  $C_{41}$  hydroxyl and the  $C_1$  carboxylate was clearly indicated, but the congested environment at  $C_{41}$  caused some concern. We believed that a  $C_{42}$ -protected seco acid precursor would be severely hindered and therefore difficult to cyclize (transform  $T_{1a}$ , R = protecting group).<sup>10</sup> Any lactonization attempted with the  $C_{42}$  hydroxyl in place was therefore predicated on a regioselective  $C_{41}$ ,  $C_{42}$  diol macrolactonization (transform  $T_{1a}$ , R = H). An alternative approach involved macrolactonization before incorporation of the  $C_{42}$  hydroxyl. This strategy focused on the cyclization of a dihydropyran hydroxy acid (transform  $T_3$ ) followed by epoxidation (transform  $T_2$ ) and sidechain addition (transform  $T_1$ ).

Common to the two strategies was hydroxy acid A, which contains a complex array of six pyran rings (A, B, C, D, E and F) containing 21 stereogenic centers. Four of the pyran subunits participate in [5.5] dioxaspiroundecane spiroketal systems. To manage the synthesis of this complex target, a convergent synthesis plan was developed (Scheme 2). Our analysis provides for three strategic disconnections to yield four principal fragments. These fragments will be joined in three successive operations: (1) a stereoselective aldol reaction to join the AB and CD spiroketal systems; (2) formation of the EF bicycle by the addition of an E-ring anomeric sulfone anion to an F-ring carbonyl electrophile; and (3) union of these two complex fragments (ABCD + EF) by a Wittig coupling of a  $C_{29}$  unstabilized phosphonium ylide with a  $C_{28}$  aldehyde.

#### **Results and Discussion**

Synthesis of the AB Spiroketal. The  $C_1$ - $C_{15}$  fragment contains six stereogenic centers arrayed on a [5.5] spiroketal framework. Because the configuration of the anomeric carbon ( $C_7$ ) of this system corresponds to the thermodynamically favored diaxial arrangement,<sup>11</sup> acid-catalyzed spirocyclization of a dihydroxy ketone precursor under equilibrating conditions should generate the desired spiroketal (Scheme 3). The acyclic precursor can be retrosynthetically bisected at the  $C_7$ - $C_8$  bond by a methyl ketone aldol or enolate acylation reaction to provide two segments of comparable complexity.

Synthesis of  $C_1$ - $C_7$  fragment 6 (Scheme 4) began from (S) alcohol 1,<sup>12</sup> prepared from TBS-protected glutaric anhydride.<sup>13</sup> Successive trityl protection and DIBAlH reduction afforded aldehyde 2 (81%) along with recovered (S)-2-naphthylethanol. Wittig homologation<sup>14</sup> and silyl deprotection afforded 4, which was subjected to base-induced internal heteroconjugate addition through the derived benzaldehyde hemiacetal to

afford the 1,3-syn acetal 5 (83%, dr >95:5).<sup>15</sup> DIBAlH reduction provided aldehyde 6 in 56% overall yield for the six-step sequence.

(a) TrCl, Et<sub>3</sub>N, CH<sub>2</sub>Cl<sub>2</sub> (b) DIBAIH, toluene, -78 °C; (c) Ph  $\mathcal{P}=CHCO_2N(OMe)Me$ , CH<sub>2</sub>Cl<sub>2</sub>; (d) TBAF, THF; (e) KOr-Bu, PhCHO, 0 °C; (f) DIBAIH, CH<sub>2</sub>Cl<sub>2</sub>, -78 °C.

The synthesis of the C<sub>8</sub>-C<sub>15</sub> fragment was initiated by alkylation of the (Z)-titanium enolate of the N-propionyloxazolidinone 7 with benzyloxymethylchloride to provide the known crystalline adduct 8 in 99% yield and >99:1 diastereoselection (Scheme 5).<sup>16</sup> Attempted methanolysis of the oxazolidinone chiral auxiliary in 8 using either stoichiometric or catalytic amounts of K<sub>2</sub>CO<sub>3</sub> (MeOH, 0 °C) led to mixtures (2:1) of the desired ester 9 and amide byproduct 9a resulting from endocyclic cleavage of the oxazolidinone ring. We subsequently found that the use of catalytic Sm(OTf)<sub>3</sub> in dry MeOH provided the desired methyl ester 9 in high yield. Recovery of the oxazolidinone auxiliary in this reaction is nearly quantitative (Scheme 5).

(a) i. TMSCH<sub>2</sub>MgCl, CeCl<sub>3</sub>, THF, -78 $\rightarrow$  25 °C; ii. silica gel, CH<sub>2</sub>Cl<sub>2</sub>, 25 °C; (b) i. 10, SnCl<sub>4</sub> (1.1 equiv), CH<sub>2</sub>Cl<sub>2</sub>, -78 °C; ii. 11, CH<sub>2</sub>Cl<sub>2</sub>; (c) *p*-NO<sub>2</sub>C<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H, PPh<sub>3</sub>, di-*t*-butyl azodicarboxylate, toluene/THF, 0 °C; (d) K<sub>2</sub>CO<sub>3</sub>, MeOH; (e) PPTS, acetone, reflux; (f) TESOTf, 2,6-lutidine, CH<sub>2</sub>Cl<sub>2</sub>, -78 °C.

Transformation of methyl ester 9 to the derived allylsilane 10 was achieved with trimethylsilyl methylmagnesium chloride and cerium(III) chloride followed by acidic silica gel induced elimination (Scheme 6).<sup>17</sup> The optimal conditions for the allylsilane addition to aldehyde  $11^{18}$  involved pre-treatment of 10 with SnCl<sub>4</sub> followed by addition of 11. This protocol provided 12 in 98% yield (dr = 94:6); the observed stereoselectivity suggests a closed transition state involving an internally chelated allylstannane (eq. 1).<sup>19</sup> Mitsunobu inversion of the C<sub>11</sub> alcohol<sup>20</sup> (79%) and subsequent methanolysis (99%) provided 13 possessing the desired absolute stereochemical relationships at both C<sub>11</sub> and C<sub>14</sub>. Successive ketal hydrolysis and silyl protection afforded the C<sub>8</sub>-C<sub>15</sub> methyl ketone fragment 14 in 53% overall yield for the seven-step sequence.

Union of the C<sub>1</sub>-C<sub>7</sub> and C<sub>8</sub>-C<sub>15</sub> fragments was initiated by enolization of methyl ketone 14 with dibutylboron triflate and *i*-Pr<sub>2</sub>NEt<sup>21</sup> followed by addition of aldehyde 6 to provide aldol adduct 15 (79%) as an inconsequential 1:1 mixture of C<sub>7</sub> diastereomers (Scheme 7). Oxidation of this mixture with chromium trioxide/pyridine/Celite<sup>22</sup> gave  $\beta$ -diketone 16 in 77% yield along with 12% recovered 15. Multiple deprotection and spiroketalization of this substrate was achieved by treatment with HF/H<sub>2</sub>O/CH<sub>3</sub>CN. As anticipated, the only spiroketal diastereomer obtained (75%) from this transformation was the thermodynamically favored anomer 17.<sup>23</sup>

After silvlation of the C<sub>1</sub> terminus, construction of the requisite C<sub>9</sub> tertiary carbinol stereocenter was achieved by treatment of **18** with methyllithium and cerium trichloride in THF to provide axial alcohol **19** (88%; dr >95:5).<sup>24</sup> Silvl protection was followed by debenzylation (LDBB)<sup>25</sup> to afford the primary alcohol **20** in 62% yield (2 steps). Oxidation (Dess-Martin periodinane, pyridine, 95%) to aldehyde **21** proceeded without epimerization of the C<sub>14</sub> stereocenter. It is noteworthy that this oxidant executes the transformation without inducing conjugation of the proximal olefin. Aldehyde **21**, which is too labile for chromatographic purification, must be used immediately in the critical aldol coupling to the CD-spiroketal (*vide infra*).

Synthesis of the CD Spiroketal. The CD spiroketal ( $C_{16}$ - $C_{28}$ ) contains a cluster of five stereogenic atoms arrayed on two spirofused pyran rings. Retrosynthetic unravelling of the CD spiroketal provides an acyclic dihydroxy ketone precursor which can be bisected at the  $C_{21}$ - $C_{22}$  bond to give two fragments of similar size (Scheme 8).

The configuration of the anomeric center ( $C_{23}$ ) corresponds to a putatively disfavored axial-equatorial arrangement. In the absence of additional stabilizing interactions, the preferred 1,7-dioxaspirane conformation disposes each ring oxygen axial to its adjoining ring (Scheme 9). This "axial-axial" conformational bias is reinforced by the complementary equatorially disposed methylene substituents affording a significant bias (~2.4 kcal/mol) for the illustrated "axial-axial" conformer.<sup>11</sup> In the natural product, the CD spiroketal C<sub>23</sub> configuration must be stabilized by additional factors which override the thermodynamic preference for the *bis*-axial configuration. Intramolecular hydrogen bonding can be an important influence in the stability of various spiroketal systems. This is particularly evident in systems containing a hydroxyl group and a spiro C-O bond in a 1,3 diaxial arrangement.<sup>26</sup> The axial C<sub>25</sub>-hydroxyl substituent of the CD spiroketal (C<sub>23</sub>) thereby stabilizing this particular spiroketal configuration (Scheme 9, CD<sub>1</sub>). In addition to this phenomenon, constraints imposed by the macrocyclic structure may favor the observed axial-equatorial C<sub>23</sub> configuration.

The synthesis of the acyclic precursor was initiated by the regioselective opening of (*R*)-trityl glycidol<sup>27</sup> (22) with divinylcuprate (Scheme 10). Carbinol 23 was conveniently homologated to  $\alpha,\beta$  unsaturated amide 24 in a one-pot process involving ozonolysis of the alkene, reduction of the ozonide, and *in situ* Wittig olefination of the unpurified aldehyde with the requisite stabilized ylide reagent.<sup>14</sup> Base catalyzed intramolecular heteroconjugate addition (*vide supra*) of benzaldehyde hemiacetal alkoxide provided the protected 1,3 syn diol 25 as a single stereoisomer.<sup>28</sup> Organolithium addition afforded the desired methyl ketone fragment 26 (C<sub>28</sub>-C<sub>22</sub>) in 43% overall yield from (*R*)-trityl glycidol (4 steps).

(a) VinyImagnesium bromide, CuI, THF, -78 °C; (b)  $O_3$ , CH<sub>2</sub>Cl<sub>2</sub>, Ph<sub>3</sub>P, -78 °C, then Ph<sub>3</sub>P=CHCO<sub>2</sub>N(OMe)Me, 73%; (c) KOt-Bu, PhCHO, 0 °C; (d) MeLi, THF, -78 °C.

With methyl ketone 26 in hand, we were poised to investigate the critical double stereodifferentiating<sup>29</sup> aldol coupling with aldehyde (S)-27<sup>12</sup> (Scheme 11). Control of the newly generated stereogenic center at C<sub>21</sub> in the aldol addition reaction may be influenced, in principle, by remote stereocenters on both the aldehyde and enolate components. Our efforts to achieve this coupling have resulted in the discovery of a stereoselective aldol variant in which induction is controlled entirely by enolate stereochemistry. Addition of the dibutylboron enolate<sup>21</sup> of methyl ketone 26 to aldehyde (S)-27 provides the 1,5 *anti* adduct 28, which corresponds to the desired CD spiroketal stereoarray (eq. 2). The controlling element in this reaction is the enolate  $\beta$  stereocenter, as evidenced by the identical outcome of aldol addition to (R)-27 (eq. 3). Additional experiments confirmed that the trend for 1,5-*anti* induction was general.<sup>30</sup> These results can be contrasted with the Mukaiyama aldol addition of the corresponding enolsilane 29, in which the aldehyde  $\beta$  stereocenter is the primary source of induction (eq. 4 vs. eq. 5).<sup>31</sup>

In preparative implementation of this process, reduction of the reaction temperature was found to further enhance the observed 1,5 *anti* selectivity. Thus aldol union of 26, through its derived boron enolate, with aldehyde (S)-27 at -110 °C proceeded with high diastereoselectivity (dr = 96:4). Methylation<sup>32</sup> of aldol adduct 28 afforded spirocyclization substrate 30. Subsequent removal of the oxygen protecting groups positioned at C<sub>19</sub>, C<sub>25</sub>, C<sub>27</sub>, and C<sub>28</sub> and concomitant spirocyclization were achieved upon treatment of 30 with camphorsulfonic acid in a MeOH/CH<sub>2</sub>Cl<sub>2</sub> solution (13 h, 25 °C).<sup>33</sup> Two separable isomeric spiroketal products 31 and

32 (ratio 6:1) were isolated in 70% yield. A byproduct which incorporated a second methyl ether at  $C_{25}$  was also identified (18%).<sup>34</sup> Diagnostic NOE experiments provided unequivocal stereochemical assignments for both spiroketal diastereomers.<sup>35</sup> The major isomer 31 possesses the undesired bis(axial) spirane ring fusion (CD<sub>2</sub>, Scheme 9).

Formation of the desired axial-equatorial spiroketal 32 was accomplished by equilibration of the diaxial spiroketal 31 using either protic or Lewis acid catalysis. (eq. 6, Table 1).<sup>26d,36</sup> Equilibration of spiroisomer 31 with various Lewis acids led to preferential formation of the desired equatorial-axial spiroisomer 32.

Presumably, the C<sub>25</sub>-hydroxyl assists in these equilibrations<sup>37</sup> by participating in an internal chelate with the metal cation and the C<sub>27</sub>-anomeric oxygen (structure **B**). Given that spiroketals **31** and **32** were prone to decomposition under these Lewis acidic conditions, magnesium trifluoroacetate offered the best compromise for maximizing both mass recovery (*ca.* 80%) and selectivity (2.6:1) for this equilibration.

Scheme 11

(a) Bu<sub>2</sub>BOTf, *i*-Pr<sub>2</sub>NEt, Et<sub>2</sub>O, -110 °C, then (S)-27; (b) Me<sub>3</sub>OBF<sub>4</sub>, 2,6-di-*t*-butyl-4-methylpyridine; (c) CSA, MeOH/CH<sub>2</sub>Cl<sub>2</sub>.

Transformation of 32 to the CD-spiroketal ethyl ketone 35 (Scheme 12) was achieved by selective protection of the  $C_{28}$  hydroxyl of 32 as its derived trityl ether, TBS-silylation at  $C_{25}$ , and transformation of the  $C_{17}$ ester functionality to an ethyl ketone through the corresponding Weinreb amide 34.<sup>38</sup> It is noteworthy that attempted transamidation of ester 33 under Lewis acidic conditions (MeONHMe+HCl, AlMe<sub>3</sub>)<sup>39</sup> afforded none of the desired amide and led to appreciable epimerization of the spiroketal stereocenter to the unnatural diaxial configuration.

(a) TrCl, pyridine, 60 °C; (b) TBSOTf, 2,6-lutidine; (c) MeO(Me)NH+HCl, EtMgBr, THF, -10 °C; (d) EtMgBr, THF, 0 °C.

**AB-CD Fragment Coupling.** By employing an aldol addition of CD spiroketal ethyl ketone **35** to AB spiroketal aldehyde **21**, we planned to establish the stereocenters at  $C_{15}$  and  $C_{16}$  concomitant with the coupling of these two fragments. Ample precedent exists for establishment of the 1,2-*anti* relationship between  $C_{15}$  and  $C_{16}$  through the use of (*E*) boron enolates;<sup>40</sup> however, control of the incipient  $C_{15}$  hydroxyl configuration was

a concern. Because each reacting partner in this proposed aldol reaction has resident stereocenters which can potentially influence the stereochemical outcome of the reaction, the stereochemical preferences of each fragment were separately investigated.

The relevant experiments are shown in equations 7 and 8. AB model aldehyde **36** underwent stereoselective aldol reactions with the boron and lithium enolates of 3-pentanone (eq. 7).<sup>41</sup> The reaction of the (*E*)boron enolate prepared from dicyclohexylchloroborane and 3-pentanone with aldehyde **36** exhibited excellent selectivity for the desired *anti* aldol, Felkin addition product **37**. The (*E*)-lithium enolate derived from 3-pentanone and LiTMP/LiBr was somewhat less selective. In these experiments, it was essential to precisely control the stoichiometry of the boron Lewis acid; excess dicyclohexylchloroborane promoted the isomerization of the substrate to the corresponding  $\alpha$ , $\beta$ -unsaturated aldehyde.

In contrast, an investigation of the intrinsic diastereofacial bias of the (E) boron enolate derived from 35 indicated that remote chirality on 35 would play a subordinate role in the stereochemical outcome of the proposed aldol union (eq. 8). Stereoselective formation of the (E)-boron enolate of 35 using Brown's procedure<sup>42</sup> and subsequent aldol coupling with isobutyraldehyde gave an inseparable mixture of the two aldol products 38 (ratio 2:1). The products are presumably the two possible *anti*-aldol isomers. The absence of significant levels of 1,4 asymmetric induction arising from the C<sub>19</sub> stereocenter implies that the (E)-boron enolate of ketone 35 would have a negligible facial bias in the projected double stereodifferentiating aldol fragment coupling.

Based on these results, the critical  $C_{15}$ - $C_{16}$  bond construction was achieved by selective formation of the (*E*)-boron enolate of **35** using (*c*-Hex)<sub>2</sub>BCl and triethylamine in pentane (Scheme 13). Addition of the unpurified aldehyde **21** to the enolate solution at -78 °C provided a mixture of aldol diastereomers (dr 90:10) favoring the desired stereoisomer in 70% overall yield. The desired isomer **39** could be obtained in 64% isolated yield over two steps (oxidation and aldol).

(a) (c-Hex)<sub>2</sub>BCl, Et<sub>3</sub>N, pentane, 0 °C, 90 min, then -78 °C, add 21; (b) HF•pyridine, THF, 0 °C; (c) MeOAc<sub>2</sub>O, *i*-Pr<sub>2</sub>EtN, CH<sub>2</sub>Cl<sub>2</sub>; (d) Ac<sub>2</sub>O, DMAP, pyridine, 22 °C; (e) Me<sub>2</sub>AlCl, CH<sub>2</sub>Cl<sub>2</sub>, -78 °C; (f) Dess-Martin periodinane, CH<sub>2</sub>Cl<sub>2</sub>.

At this point, incorporation of the C<sub>5</sub> and C<sub>15</sub> acetate residues present in the altohyrtin structure was addressed. Selective desilylation of **39** at C<sub>1</sub> and C<sub>5</sub> using buffered HF•pyridine provided triol **40** (78%).<sup>43</sup> Selective monoacetylation at the C<sub>1</sub>-hydroxyl using methoxyacetic anhydride was followed by bis(acylation) at C<sub>5</sub> and C<sub>15</sub> with acetic anhydride to afford **41** (89%). The selection of the methoxyacetyl residue for interim protection of the C<sub>1</sub> terminus was made after difficulties were encountered in the selective hydrolysis of the corresponding C<sub>1</sub> acetate. Optimal conditions (Et<sub>3</sub>N, MeOH/H<sub>2</sub>O)<sup>44</sup> promoted the slow (> 72 h) removal of the C<sub>1</sub> acetate. However, during this extended reaction time, deacetylation at C<sub>1</sub> was accompanied by  $\beta$ -elimination of the C<sub>15</sub> acetate to give substantial amounts of the corresponding  $\alpha$ , $\beta$  unsaturated ketone.

Refunctionalization of the  $C_{28}$  terminus in preparation for Wittig coupling was then undertaken. Removal of the  $C_{28}$  trityl ether proved to be a challenging transformation due to the lability of the equatorial-axial spiroketal center, which precluded the use of protic acids. This deprotection was modelled with the CD spiroketal ethyl ketone **35** (eq. 9, Table 2). Transfer hydrogenolysis of the trityl ether (entry 1)<sup>45</sup> proceeded slowly, and considerable unreacted starting material remained after 36 hours. Application of these conditions to the fully elaborated ABCD *bis*-spiroketal system resulted in competing saturation of the  $C_{13}$  disubstituted olefin. A range of Lewis acids<sup>46,47</sup> (entries 2 and 3) promoted trityl deprotection; however, in nearly all cases, isomerization of the spiroketal system to the bis(axial) configuration was observed. Dimethylaluminum chloride<sup>48</sup> was uniquely effective, promoting the efficient removal of the trityl ether at -78 °C with minimal epimerization at  $C_{23}$ . It was critical in these experiments to perform a work-up procedure which resulted in the removal of the organoaluminum salts prior to concentration of the product residue. If this procedure was not performed correctly, quantitative isomerization of the product was observed (entries 4 and 5). Presumably, the intermediate organoaluminum species can internally activate the spiroketal system toward isomerization via an oxocarbenium ion intermediate (eq. 10).

This deprotection reaction was applied to the *bis* spiroketal system 41 with complete fidelity to the model experiments (Scheme 13). The  $C_{28}$ -hydroxyl compound could be isolated in good yield under these conditions. Oxidation with Dess-Martin periodinane provided aldehyde 42, a critical substrate for the Wittig fragment coupling (*vide infra*).

Synthesis of the E-Ring Sulfone. Synthesis of the  $C_{29}$ - $C_{37}$  E-ring fragment was initiated from the enantiomerically pure boron aldol adduct  $45^{12}$  (Scheme 14). Protection of the  $C_{33}$  hydroxy group and amide reduction afforded aldehyde 46 in 97% yield (2 steps). The *syn* stereotriad was completed by a Felkin selective addition of silylketene acetal 47 (87%, diastereoselection 94:6).<sup>49,50</sup> Use of the original Fukuyama conditions (Et<sub>3</sub>SiH/Pd/C)<sup>51</sup> for the reduction of thioester 48 afforded predominantly the saturated aldehyde. To circumvent this problem, the reduction was conducted in the presence of Lindlar's catalyst and a sacrificial mono-

(a) TESOTF, 2,6-lutidine; (b) DIBAIH, -78 °C; (c) 47, BF<sub>3</sub>·E<sub>2</sub>O, CH<sub>2</sub>Cl<sub>2</sub>, -78°C; (d) Lindlar cat., Et<sub>3</sub>SiH, 1-hexene, acetone; (e) CSA, MeOH; (f) TBSCl, imidazole, DMF; (g) 9-BBN, then H<sub>2</sub>O<sub>2</sub>; (h) TMSSPh, Znl<sub>2</sub>; (i) NaH, BnBr, Bu<sub>4</sub>NI; (j) mCPBA, NaHCO<sub>3</sub>.

substituted terminal olefin.<sup>52</sup> Given careful monitoring of the reaction, the aldehyde was obtained in 93% yield with minimal overreduction. Acid-catalyzed deprotection-acetalization followed by silyl protection of the remaining secondary alcohol afforded the E-ring methyl ketal **49** (81%, 3 steps). Hydroboration (9-BBN) then provided alcohol **50** (85%). Preparation of the E-ring phenylsulfone **51** was completed by successive anomeric sulfide formation (TMSSPh, ZnI<sub>2</sub>),<sup>53</sup> C<sub>29</sub> alcohol benzylation (NaH, BnBr, Bu<sub>4</sub>NI, 90% from **50**), and sulfide oxidation (mCPBA, NaHCO<sub>3</sub>, 97%).

Synthesis of the F-Ring Dihydropyran. Our previously reported synthesis<sup>1a</sup> of the  $C_{38}$ - $C_{43}$  F-ring fragment utilized a Cu(II)-catalyzed enantioselective acetate aldol reaction<sup>54</sup> for the construction of synthon 55 (Figure 2). Aldol adduct 54 was transformed via Fräter-Seebach alkylation (71% yield; dr = 5-8:1)<sup>55</sup> to the formal *anti* aldol product 55, which was elaborated to a fully functionalized F-ring dihydropyran. Subsequent to these studies, the development of a Sn(II)-catalyzed, enantioselective *anti* aldol reaction in these laboratories<sup>56</sup> suggested an improved route to this fragment (Figure 2). Adduct 56 contains the required *anti* stereoarray and incorporates a C<sub>38</sub> ester, potentially avoiding the oxidation state adjustment employed in the previous route from 55.

In analogy to our previous F-ring synthesis, adduct **56** was TES-protected and reduced (Pd/C, Et<sub>3</sub>SiH) to provide aldehyde **58** (Scheme 15). The use of Fukuyama conditions was demonstrated for the first time with *phenyl* thioesters and allowed the selective reduction of the thioester in the presence of the ethyl ester. A diastereoselective Mukaiyama aldol reaction (**47**, BF<sub>3</sub>•OEt<sub>2</sub>) provided the desired C<sub>41</sub> stereoisomer in 71% isolated yield, and a second Fukuyama reduction selectively converted ethyl thioester **59** to the corresponding  $\beta$ hydroxy aldehyde. Treatment of this aldehyde with CSA in MeOH effected deprotection and internal ketalization as well as a fortuitous transesterification of the C<sub>38</sub> ethyl ester to the corresponding methyl ester **60**. At this stage, a modified elimination sequence was employed in order to accommodate the epimerization-prone C<sub>39</sub> stereocenter. Transformation to anomeric sulfide **61**,<sup>53</sup> oxidation, and sulfoxide thermolysis<sup>57</sup> provided Fring dihydropyran methyl ester **62**.

(a) TESCI, imidazole; (b) Pd/C, Et<sub>3</sub>SiH, acetone; (c) BF<sub>3</sub>\*OEt<sub>2</sub>, toluene, -93 °C; (d) CSA, MeOH/CH<sub>2</sub>Cl<sub>2</sub> (1:1);
 (e) TESCI, imidazole; (f) TMSSPh, Znl<sub>2</sub>, 1,2-dichloroethane; (g) mCPBA, EtOAc, 0 °C; (h) benzene, 80 °C.

EF Bicycle Assemblage. Initial model studies indicated that addition of lithiated E-ring sulfone 63 to aldehydes resulted in elimination to an E-ring dihydropyran which could not be efficiently rehydrated (eq.

11).<sup>58</sup> In contrast, addition to simple acid chlorides was highly efficient and provided the intact sulfone coupling product without concomitant elimination (eq. 11).

The preparation of F-ring acid chloride **64a** was achieved via methyl ester cleavage (TMSOK, THF)<sup>59</sup> and treatment with the Ghosez reagent (Scheme 16).<sup>60</sup> This

method for acid chloride formation was unique in its tolerance of the highly acid-sensitive dihydropyran intermediate. Additional acyl derivatives of the F-ring dihydropyran were prepared from **64a** by treatment with appropriate alcohols, thiols, or amines (Scheme 16).

Acyl chloride **64a** was anticipated to be the most reactive F-ring derivative. As this intermediate could not be purified, an unpurified solution of **64a** in CH<sub>2</sub>Cl<sub>2</sub> was added directly to the sulfone anion (in THF) at -78 °C.<sup>61</sup> This procedure, under various conditions of stoichiometry, led to irreproducible results and low yields (*ca.* 30%). Following the precedent of Beau,<sup>58</sup> we next examined the pure and stable acyl derivatives **64b** and **64c**. In reactions of these partners with the lithiated E-ring sulfone, both the sulfone and the ester or thioester were recovered

(a) TMSOK, THF, then pH 5.5 buffer; (b) 1-chloro-2,N,N-trimethyl -propenylamine; (c) PhOH, Et<sub>3</sub>N, DMAP, CH<sub>2</sub>C<sub>b</sub>; (d) PhSH, pyridine, CH<sub>2</sub>Cl<sub>2</sub>; (e) 2-(methylamino)pyridine, pyridine, DMAP, CH<sub>2</sub>Cl<sub>2</sub>; (f) benzotriazole, pyridine, DMAP, CH<sub>2</sub>Cl<sub>2</sub>.

unchanged. Two observations led us to conclude that these esters had been enolized by the sulfone anion: (1) the addition of either **64b** or **64c** decolorized the characteristically bright yellow lithiated sulfone solution; (2) in the attempted coupling of phenyl ester **64b** we were able to isolate a small amount of the ester as its  $C_{39}$  epimer. It is likely that the thermodynamic acidity of the  $C_{39}$  proton is greatly enhanced by the electron withdrawing effect of the enol ether function. Moreover, the relatively flat structure of the dihydropyran may increase the kinetic acidity of the sterically accessible  $C_{39}$  proton.

These experiments prompted us to investigate substituted amides as coupling partners for which enolization is precluded by allylic strain. While the pyridylamide **64d** was inert under the reaction conditions, the benzotriazole amide **64e** proved more reactive. Treatment of the sulfone anion with **64e** afforded the desired ketone in approximately 80% yield as a 60:40 mixture of sulfone anomers using a 20% excess of the anion.<sup>62</sup> Implementation of this acylation strategy (Scheme 17) provided the EF bicycle in 55% yield from **62** (4 steps).

(a) LDA, THF, -78 °C, then 64e; (b) i. Znl<sub>2</sub>, MeOH; ii. MgBr<sub>2</sub>Et<sub>2</sub>O, MeOH; (c) KBHEt<sub>3</sub>, THF, -78 → -40 °C; (d) TESCl, imidazole, DMF.

Methanolysis of 65 provided ketone 66 in 48% isolated yield.<sup>63</sup> Of the hydride reducing agents surveyed, KBHEt<sub>3</sub> proved most effective in securing the desired alcohol stereochemistry at  $C_{38}$  (90%; dr >95:5). The observed stereoselectivity is presumably a consequence of Felkin induction from the  $C_{39}$  stereocenter. At this

juncture, single crystal X-ray analysis of alcohol 67 confirmed the structure of this advanced intermediate.<sup>64</sup> Silylation of the hindered secondary alcohol was achieved with TESCl in DMF to give 68.

Addition of the C44-C51 Sidechain. Concurrent with these studies, we investigated the feasibility of the projected late stage sidechain addition.<sup>65</sup> The synthesis plan called for stereoselective epoxidation of the F-ring dihydropyran followed by the stereoselective addition of a sidechain allyl metal to the resulting epoxide (see Scheme 1). The epoxidation was well precedented in Danishefsky's work with the similarly configured tri-O-benzyl glucal,<sup>66a</sup> and the Danishefsky 1,2-anhydrosugar 69 served as a convenient model for additions of simple allylmetals (Table 3, eq. 12). While allylmagnesium bromide effected a stereoselective and efficient epoxide opening to give  $\beta$ -C-glycoside 70 (Table 3, entry 3),<sup>67</sup> concerns about the compatibility of allylic Grignards with more advanced intermediates led us to investigate alternative conditions. AllyIstannanes (Table 2, entries 4-6) were subsequently identified as viable nucleophiles in Lewis acid mediated additions

Table 3. Allyl metal additions to a model glycal epoxide (eq. 12)

to 69; tributyltin triflate proved the optimal Lewis acid with regard to both stereoselectivity and yield (Table 3, entry 6). This addition sequence was applicable in the analogous F-ring system (eq. 13).<sup>68</sup>

Synthesis of a fully functionalized sidechain allylstannane began with the known (2S,3E)-hexa-3,5-diene-1,2-diol  $(72)^{69}$  (Scheme 18). A three-step sequence provided mono-silylated ether 73 in 90% overall yield without intervening purifications. While the corresponding tosylate and iodide were not reactive toward nucleophilic substitution, conversion of 73 to its unstable triflate derivative followed by immediate treatment with the lithium enolate of methyl- $\beta$ -dimethylaminopropionate<sup>70</sup> provided 74 in 80% yield. Quaternization and elimination of the dimethylamino group were accomplished in a single reaction (MeI, Na<sub>2</sub>CO<sub>3</sub>, 94%).<sup>71</sup> Ester reduction (DIBAIH, 95%) gave the corresponding allylic alcohol. *In situ* mesylation and displacement with tributylstannyllithium<sup>72</sup> afforded TES-protected allylstannane 76a in 85% yield. Basic deprotection and re-silylation then provided TMS-protected allylstannane 76c in 93% yield.

(a) AcCl, 2,6-lutidine, CH<sub>2</sub>Cl<sub>2</sub>, -78 °C; (b) TESCl, imidazole, CH<sub>2</sub>Cl<sub>2</sub>; (c) DIBAIH, toluene, -78 °C; (d) Tf<sub>2</sub>O, pyridine, CH<sub>2</sub>Cl<sub>2</sub>, -10 °C;
 (e) methyl-β-dimethylaminopropionate, LDA, THF, -78 °C; (f) Mel, Na<sub>2</sub>CO<sub>3</sub>, MeOH; (g) DIBAIH, CH<sub>2</sub>Cl<sub>2</sub>, -78 °C; (h) BuLi, MsCl, THF, -78 °C, then Bu<sub>3</sub>SnLi; (i) NaOH, EtOH; (j) N,O-bis(trimethylsilyl)acetamide.

This final protecting group adjustment ( $76a \rightarrow 76c$ ) represented a crucial transformation, as the efficiency of the sidechain addition was highly dependent on the identity of the allylstannane's hydroxyl protecting group (eq. 14, Table 4). All variations provided high  $\beta:\alpha$  selectivities, but the isolated yields differed significantly. More sterically demanding alcohol protecting groups generally afforded lower yields (entries 1-3),<sup>73</sup> while the electronically deactivating acetate protecting group also gave poor results (entry 4). This steric effect was somewhat surprising given the apparently remote nature of the C<sub>47</sub> hydroxyl and the unhindered environment around the  $C_{43}$  center observed in the dihydropyran crystal structure. Use of higher concentrations of allylstannane improved the reaction efficiency (entry 5 vs. entry 3), supporting the interpretation that the rate of stannane addition must compete with the rate of nonproductive decomposition of the epoxide. Since the unreacted allylstannanes could be quantitatively recovered after flash chromatography, the use of multiple equivalents of stannane was regularly employed; the optimal protocol entailed treatment of the epoxide with tributyltin triflate and 16 equivalents of TMS-protected allylstannane **76c**.<sup>74</sup>

(a) Dimethyldioxirane, acetone, CH 2Cl 2, 0 °C; (b) 16 equiv 76c, 2 equiv Bu3SnOTf, CH2Cl 2, -78 °C; (c) HF, H2O, CH3CN, 0 °C.

Application of this methodology in more complex systems was highly successful (Scheme 19). Epoxidation of bicycle 68 with dimethyldioxirane proceeded quantitatively (dr >95:5). Treatment of the epoxide with allylstannane 76c and tributylstannyl triflate provided the desired adduct 79 in 80% yield as a single diastereomer. The excess allylstannane from this experiment was recovered quantitatively after chromatography.

At this juncture, acidic conditions were evaluated for the deprotection of the EF-bis(pyran) 79. Prior experience had revealed that E-ring  $\Delta$ -C<sub>36</sub> dihydropyran formation was to be avoided since rehydration of this intermediate was problematic. Under the optimal conditions, treatment of 79 with aqueous HF resulted in removal of all four silyl protecting groups as well as hydrolysis of the C<sub>37</sub> methyl ether to provide lactol 79a. This experiment allayed concerns that the unwanted elimination to the dihydropyran would complicate the projected final deprotection sequence leading to the target structure.

Wittig Fragment Coupling and Elaboration. In accord with our plan to delay sidechain introduction to the latest possible stage, EF-bis(pyran) benzyl ether 68 was further elaborated to phosphonium salt 81 (Scheme 20). This key Wittig coupling partner was prepared via successive debenzylation (LDBB, 96%), me-sylation (MsCl, Et<sub>3</sub>N, 99%), sodium iodide substitution (NaI, acetone, 94%), and displacement by triphenylphosphine (PPh<sub>3</sub>, MeCN, 94%).

(a) LDBB, THF, -78 °C; (b) MsCl, Et<sub>3</sub>N, CH<sub>2</sub>Cl<sub>2</sub>; (c) Nal, NaHCO<sub>3</sub>, Na<sub>2</sub>SO<sub>3</sub>, acetone; (d) PPh<sub>3</sub>, CH<sub>3</sub>CN.

Deprotonation of **81** (1.26 equiv) with LiHMDS followed by addition of ABCD aldehyde **42** provided the desired Wittig product **82** in 64% yield (>95:5 Z:E).<sup>75</sup> Selective removal of the methoxyacetate C<sub>1</sub> protecting group was accomplished using NH<sub>3</sub>/MeOH in 82% yield. While hydrolysis of the secondary acetates at C<sub>5</sub>

and  $C_{15}$  was not observed, a minor byproduct resulting from  $\beta$ -elimination of the  $C_{15}$  ester was isolated (*vide supra*). The primary alcohol was oxidized to the aldehyde 83 using Dess-Martin periodinane (92% yield).

The two remaining major transformations, macrolactonization and sidechain addition, could, in principle, be carried out in either order. We first examined macrolactonization of the dihydropyran hydroxy acid 83a, which was synthesized via modified Krause oxidation<sup>76</sup> of 83 and selective deprotection of the allylic C<sub>41</sub> TES ether (HF•pyridine, pyridine, THF, 0 °C). As anticipated, this sterically unencumbered hydroxy acid readily underwent macrolactonization under Yamaguchi conditions<sup>77</sup> (room temperature, <3 h) to afford the dihydropyran macrolactone 84 (55% yield, 3 steps).

Epoxidation of this advanced dihydropyran intermediate was expected to be challenging due to the presence of two additional olefins ( $C_{28}$ - $C_{29}$  and  $C_{13}$ ). While 1,1 disubstituted olefins are less reactive toward dioxiranes, *cis* olefins are known to react readily with dimethyldioxirane.<sup>78</sup> Overoxidation at the  $C_{28}$ - $C_{29}$ olefin was thus identified as a potential problem. To examine this epoxidation, small scale experiments were designed in order to preserve this precious synthetic intermediate. Typically, 0.005 mg of macrolactone **84** were dissolved in 100  $\mu$ L CH<sub>2</sub>Cl<sub>2</sub> (0 °C). Approximately 20 equiv of a dilute solution of DMDO in acetone/CH<sub>2</sub>Cl<sub>2</sub> (100  $\mu$ L) were added, and the reaction was stirred at 0 °C. Reaction monitoring was achieved by removal of 1% aliquots from the reaction and subsequent electrospray ms analysis.<sup>79</sup> The results (Figure 3)

time (min)

Figure 3. Chemoselective epoxidation of macrocyclic dihydropyran 84

indicate that epoxidation occurred with almost complete chemoselectivity for the dihydropyran olefin despite the fact that the rate of epoxidation was significantly reduced relative to simpler systems.<sup>80</sup>

Preliminary attempts at sidechain addition to epoxide **85** (16 equiv **76c**, Bu<sub>3</sub>SnOTf, CH<sub>2</sub>Cl<sub>2</sub>) resulted in a complex mixture of compounds, none of which incorporated the C<sub>44</sub>-C<sub>51</sub> sidechain by ms or NMR. Rather than pursue this disappointing result, we focused our attention on the alternative route involving addition of the sidechain prior to macrocyclization (Scheme 22). The C<sub>1</sub> oxidation sequence (*vide supra*) was again employed and followed by silylation of the resultant acid to give ester **86** (72% yield, 2 steps from **83**). Epoxidation of the C<sub>42</sub>-C<sub>43</sub> dihydropyran was accomplished with complete chemo- and stereoselectivity (as judged by <sup>1</sup>H NMR analysis) by addition of ~1.5 equiv of dimethyldioxirane (DMDO).<sup>81</sup> Immediate treatment of the resulting epoxide with allylstannane **76c** (16 equiv) and tributylstannyl triflate (2 equiv) afforded the desired adduct **87** in 80-94% isolated yield as a single diastereomer. The excess allylstannane was recovered in quantitative yield after column chromatography.

At this stage, the crucial regioslective diol macrolactonization (vide supra) was investigated. As a prelude to macrocycle formation, selective deprotection of ester 87 was implemented. Treatment of this intermediate with buffered HF•pyridine (THF, 0 °C), resulted in removal of the triisopropylsilyl (TIPS) ester, the  $C_{47}$  TMS ether, and the  $C_{41}$  TES ether while retaining the silyl protecting groups at  $C_9$ ,  $C_{25}$ ,  $C_{35}$ , and  $C_{38}$ (Scheme 22). Subjection of acid triol 88 to Yamaguchi macrolactonization conditions (2,4,6-trichlorobenzoyl chloride, *i*-Pr<sub>2</sub>NEt, DMAP) provided a product tentatively identified as the desired macrocycle bearing a trichlorobenzoyl group at the  $C_{47}$  oxygen. To prevent this undesired acylation, selective protection of acid triol 88 at the  $C_{47}$  hydroxyl was performed prior to macrolactonization to give TES ether 89 (TESCl, imidazole, 0 °C, 97%).<sup>82</sup>

Exposure of **89** to modified Yamaguchi conditions provided a single regioisomeric lactone **90** in 86% yield. It is noteworthy that this macrocyclization was much less facile than cyclization of the corresponding dihydropyran hydroxy acid (Scheme 21), requiring high temperature (refluxing benzene) and syringe pump addition techniques (42 h) for optimal results. The regiochemical outcome of the reaction was established by observation of the coupling patterns among the C<sub>40</sub>-C<sub>44</sub> protons in the COSY spectrum (500 MHz, benzened<sub>6</sub>). This allowed an unambiguous assignment of the C<sub>41</sub>H and C<sub>42</sub>H resonances; the large downfield shift of the C<sub>41</sub>H resonance ( $\delta$  4.84 for C<sub>41</sub>H,  $\delta$  3.45 for C<sub>42</sub>H) verified that macrolactonization had occurred at the C<sub>41</sub> hydroxyl.

Deprotection (HF/H<sub>2</sub>O/MeCN) provided synthetic altohyrtin C, which was isolated in 67-85% yield after reverse phase HPLC (Scheme 23). A detailed comparison of the natural and synthetic compounds was especially important in light of the stereochemical discrepancies which, in part, motivated the total synthesis. Thus the synthetic material was found to be identical to a sample of natural spongistatin 2<sup>83</sup> as judged by <sup>1</sup>H NMR (500 MHz, CD<sub>3</sub>CN), COSY, HPLC, electrospray mass spectroscopy, and UV spectroscopy. Comparison of optical rotations confirmed that the synthetic and natural compounds possessed the same absolute stereochemistry (synthetic  $[\alpha]^{24}_D$  +26.6 (*c* 0.04, MeOH); natural  $[\alpha]^{24}_D$  +29.2 (*c* 0.12, MeOH)). Further, comparison of 1D <sup>1</sup>H NMR and 2D COSY spectra (500 MHz, DMSO-*d*<sub>6</sub>) confirmed that the synthetic material was also identical to natural altohyrtin C.<sup>84</sup> We thus conclude that spongistatin 2 and altohyrtin C are identical compounds and speculate that the altohyrtin stereochemical assignment can be extended to the remaining members of the spongipyran family.<sup>85</sup>

**Conclusion.** The first total synthesis of a spongipyran macrolide, altohyrtin C/spongistatin 2, has been completed. The relative and absolute configurational assignment of Kobayashi and Kitagawa has been confirmed, and the spongistatin and altohyrtin families have been unified under a single structural identity. The synthesis required 32 steps (longest linear sequence) and produced the natural product in 0.9% overall yield for an average yield of 86% per step. A 1,5-anti, enolate-controlled methyl ketone aldol was developed to construct the CD-spiroketal and implemented for the first time in the synthesis of a natural product. The use of a Sn(II)-bis(oxazoline)-catalyzed, enantioselective anti aldol in a total synthesis was also demonstrated for the first time. A diastereoselective, Lewis acid mediated addition of allylstannanes to anomeric epoxides has been developed and successfully applied in a complex, late stage fragment coupling. As a result, the route to altohyrtin C reported here is, in principle, readily applicable to the sidechain congeners altohyrtin A (spongistatin 1) and altohyrtin B,<sup>4b</sup> with dihydropyran **86** serving as a common intermediate for the synthesis of these compounds and additional analogs.

#### **Experimental Section**

General. Melting points were determined with a Buchi SMP-20 melting point apparatus equipped with an Omega Model 450 AET thermocouple thermometer and are uncorrected. Infrared (IR) spectra were recorded on a Perkin Elmer 1600 series FT-IR spectrophotometer. <sup>1</sup>H NMR spectra were recorded on Bruker DMX-500, AM-500 or AM-400 spectrometers. Chemical shifts are reported in ppm from tetramethylsilane or with the solvent resonance as the internal standard. <sup>13</sup>C NMR spectra were recorded on Bruker AM-500 (125 MHz) or AM-400 (100.6 MHz) spectrometers with proton decoupling. Chemical shifts are reported in ppm from tetramethylsilane or with the solvent as the internal standard. Mass spectra were obtained on JEOL AX-505 and SX-102 high resolution magnetic sector mass spectrometers by the Harvard University Mass Spectrometry Laboratory. Optical rotations were measured on a Jasco DIP-0181 digital polarimeter with a mercury or sodium lamp, and are reported as follows: [ $\alpha$ ] t(°C)  $\lambda$ , (*c* (*g*/100 mL), solvent). Analytical thin layer chromatography (TLC) was performed on EM Reagent 0.25mm silica gel 60-F plates. Chromatography on silica gel was performed using a forced flow of the indicated solvent system (flash chromatography) on EM Reagents Silica Gel 60 (230-400 mesh) or Waters Preparative C<sub>18</sub> Silica Gel (125Å, 55-105 μm). Solvents used for extraction and chromatography were HPLC grade. Unless otherwise noted, all non-aqueous reactions and distillations were carried out under an atmosphere of dry nitrogen in glassware that had been either flamedried under a stream of nitrogen or oven-dried (80 °C) overnight. pH 7.0 phosphate buffer (0.05 M), commercially available from Fisher Scientific, was used when pH 7.0 buffer is indicated. When necessary, solvents and reagents were dried prior to use. Deuterochloroform was stored over 4 Å molecular sieves. Toluene was distilled from potassium metal. Tetrahydrofuran (THF) and diethyl ether (Et<sub>2</sub>O) were distilled from sodium or potassium metal and benzophenone ketyl. Dichloromethane (CH<sub>2</sub>Cl<sub>2</sub>), trimethylchlorosilane, oxalyl chloride, pentane, pyridine, 2,6-lutidine, triethylamine, diisopropylethylamine, and diisopropylamine were distilled from calcium hydride. Methanol (MeOH) was distilled from magnesium methoxide  $(Mg(OMe)_2)$ . Boron trifluoride etherate was distilled from calcium hydride under reduced pressure. Di-nbutylboron trifluoromethanesulfonate (di-n-butylboron triflate) was prepared according to the procedure of Inoue and Mukaiyama as modified by Evans and co-workers. Trimethylsilylmethyl chloride and benzaldehyde were distilled immediately before use. (S)-2-Naphthyl ethanol was used as received and could be reutilized after recrystallization from hot hexanes. All other commercially available reagents were used as received.

[2'S,3S]-1-(2'-Naphthyl)ethyl-3-(*tert*-butyldimethylsiloxy)-5-triphenyl-methyloxy-pentanoate (1a). To a solution of 16.00 g (39.80 mmol) of alcohol 1 in 50 mL of CH<sub>2</sub>Cl<sub>2</sub> under argon atmosphere was added 11.06 mL (79.60 mmol) of triethylamine followed by 12.20 g (43.78 mmol) of trityl chloride. The resultant yellow cloudy mixture was stirred for 12 h at room temperature, then concentrated *in vacuo*. Purification of the residue by flash chromatography on silica gel (5% EtOAc/hexanes) gave 23.32 g (36.22 mmol, 91%) of trityl ether 1a as a clear oil:  $[\alpha]^{23}_{589}$  -33.1 (*c* 2.14, CH<sub>2</sub>Cl<sub>2</sub>); IR (neat) 3058, 2953, 2928, 2855, 1736 cm<sup>-1</sup>; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz) δ 7.78-7.83 (m, 4H), 7.40-7.49 (m, 9H), 7.19-7.31 (m, 9H), 6.06 (q, 1H), 4.31 (m, 1H), 3.15 (m, 2H), 2.51 (dd, 1H. *J* = 5.8, 15.0 Hz), 2.46 (dd, 1H, *J* = 6.5, 15.0 Hz), 1.89 (m, 2H), 1.63 (d, 3H, *J* = 6.6 Hz), 0.71 (s, 9H), -0.10 (s, 3H), -0.69 (s, 3H); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100.6 MHz) δ 170.7, 144.2, 138.9, 133.1, 132.9, 128.6, 128.3, 127.9, 127.7, 127.6, 126.8, 126.1, 125.9, 125.0, 124.0, 86.6, 72.3, 66.9, 60.4, 43.0, 37.6, 25.6, 22.2, 17.8, -4.9; exact mass (70eV, FAB/NaI) calculated for C<sub>42</sub>H<sub>48</sub>O<sub>4</sub>Sii C, 78.26; H, 7.45; found: C, 78.16; H, 7.52.

(35)-3-(*tert*-Butyldimethylsiloxy)-5-triphenylmethyloxypentanal (2). To a -78 °C solution of 23.32 g (36.22 mmol) of 1a in 360 mL of toluene was added dropwise 36.2 mL (54.33 mmol) of DIBAlH (1.5 M solution in toluene). After stirring for 2 h at -78 °C, the reaction was quenched by the addition of EtOAc (5.00 mL) followed by the slow addition of saturated Na/K tartrate solution (200 mL). After stirring at room temperature for 2 h, the aqueous solution was separated and extracted with 2 x 150 mL of Et<sub>2</sub>O. The combined organic solutions were washed with brine, dried over anhydrous MgSO<sub>4</sub>, filtered, and concentrated *in vacuo*. Purification of the residue by flash chromatography on silica gel (10% EtOAc / hexanes) gave 15.28 g (32.23 mmol, 89%) of aldehyde 2 as a clear oil:  $[\alpha]^{23}_{589}$  +1.1 (*c* 0.89, CH<sub>2</sub>Cl<sub>2</sub>); IR (neat) 3086, 3058, 3033, 2953, 2527, 2880, 2855, 2738, 1725, 1692, 1638 cm<sup>-1</sup>; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz)  $\delta$  9.76 (t, 1H, *J* = 2.4 Hz), 7.44-7.21 (m, 15H), 4.34 (qt, 1H), 3.15 (t, 2H, *J* = 6.4 Hz), 2.46 (m, 2H), 1.93 (m, 1H), 1.82 (m, 1H), 0.78 (s, 9H), 0.01 (s, 3H), -0.57 (s, 3H); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100.6 MHz)  $\delta$  202.2, 144.1, 128.6, 127.8, 127.0, 86.7, 65.9, 60.2, 50.9, 38.0, 25.7, 17.9, -4.65, -4.73; exact mass (70eV, FAB/NaI) calculated for C<sub>30</sub>H<sub>38</sub>O<sub>3</sub>SiNa: 497.2488; found: 497.2482; Rf = 0.59 (30% EtOAc / hexanes).

[2E,5S)-(tert-Butyldimethylsiloxy)-7-(triphenylmethyloxy)-[N-methoxy-N-methyl]-2-heptenamide (3). A solution of 15.28 g (32.23 mmol) of aldehyde 2 and 14.67 g (40.42 mmol) of N-methoxy-N-methyl-(triphenylphosphoranylidene)acetamide in 250 mL of CH<sub>2</sub>Cl<sub>2</sub> was stirred at room temperature for 12 h. The solvent was removed *in vacuo* to provide a viscous yellow oil. Purification of the residue by flash chromatog-raphy on silica gel (30% EtOAc / hexanes) gave 16.93 g (30.29 mmol, 94%) of 3 as a clear oil:  $[\alpha]^{23}_{589}$  -5.27 (c 1.29, CH<sub>2</sub>Cl<sub>2</sub>); IR (neat) 3086, 3058, 3033, 2930, 2884, 2856, 1666, 1634 cm<sup>-1</sup>; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz)  $\delta$  7.45-7.41 (m, 6H), 7.31-7.29 (m, 6H), 7.25-7.21 (m, 3H), 6.95 (dt, 1H, J = 7.4, 15.4 Hz), 6.38 (d, 1H, J)

J = 15.4 Hz), 3.95 (qt, 1H), 3.67 (s, 3H), 3.24 (s, 3H), 3.17 (m, 1H), 3.09 (m, 1H), 2.34 (m, 2H), 1.80 (m, 2H), 0.78 (s, 9H), 0.00 (s, 3H), -0.11 (s, 3H); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100.6 MHz)  $\delta$  166.4, 144.1, 143.8, 128.4, 127.5, 126.7, 120.7, 86.4, 68.9, 61.4, 60.6, 40.5, 37.3, 32.1, 25.6, 17.8, -4.6, -5.0; exact mass (70eV, FAB/NaI) calculated for C<sub>34</sub>H<sub>45</sub>NO<sub>4</sub>SiNa: 582.3016; found: 582.2995; R<sub>f</sub> = 0.53 (50% EtOAc / hexanes). Anal. Calcd. for C<sub>34</sub>H<sub>45</sub>NO<sub>4</sub>Si; C, 72.98; H, 8.05; N, 2.50; found: C, 72.87; H, 8.15; N, 2.43.

[2E,5S]-5-Hydroxy-7-(triphenylmethyloxy)-N-methoxy-N-methyl-2-heptenamide (4). To a solution of 16.93 g (30.29 mmol) of silyl ether 3 in 150 mL of anhydrous THF at room temperature was added 66 mL (66.00 mmol) of tetrabutylammonium fluoride (1.0 M in THF). The resulting yellow solution was stirred at room temperature for 10 h before it was diluted with 200 mL of Et<sub>2</sub>O. The mixture was washed with saturated NH<sub>4</sub>Cl solution (2 x 100 mL) and brine (2 x 100 mL), dried over MgSO<sub>4</sub>, filtered, and concentrated *in vacuo*. Purification of the residue by flash chromatography on silica gel (40% EtOAc / hexanes) gave 12.47 g (28.17 mmol, 93%) of alcohol 4 as a pale yellow oil:  $[\alpha]^{23}_{589}$  +9.0 (*c* 1.87, CH<sub>2</sub>Cl<sub>2</sub>); IR (neat) 3418, 3057, 2937, 1661, 1620 cm<sup>-1</sup>; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 500 MHz)  $\delta$  7.41-7.45 (m, 6H), 7.29-7.33 (m, 6H), 7.23-7.26 (m, 3H), 6.95 (dt, 1H, *J* = 7.4, 15.4 Hz), 6.45 (d, 1H, *J* = 15.4 Hz), 3.95 (m, 1H), 3.68 (s, 3H), 3.39 (m, 1H), 3.24 (m, 1H), 3.23 (s, 3H), 2.98 (d, 1H, *J* = 3.1 Hz), 2.38 (m, 2H), 1.78 (m, 2H); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100.6 MHz)  $\delta$  166.5, 143.7, 143.5, 128.4, 127.8, 127.0, 121.0, 87.1, 69.7, 62.0, 61.5, 40.2, 36.1, 32.2; exact mass (70eV, EI) calculated for C<sub>28</sub>H<sub>31</sub>NO<sub>4</sub>; C, 75.50; H, 6.97; N, 3.14; found: C, 75.26; H, 6.98; N, 3.10.

[25,45,65]-4-(*N*-methoxy-*N*-methyl-carboxamidomethyl)-6-[(2-triphenylmethyloxy)-ethyl]-2-phenyl-1,3dioxane (5). To a solution of 5.00 g (11.23 mmol) of amide 4 in 112 mL of THF at 0 °C was added 1.25 mL (12.35 mmol) of freshly distilled benzaldehyde followed by 0.051 g (0.56 mmol) of *t*-BuOK. The resulting yellow solution was stirred for 15 min at 0 °C. This sequence was repeated again. After 25 min the reaction mixture was quenched with 100 mL of pH 7 phosphate buffer. The aqueous solution was separated and extracted with 3 x 100 mL of Et<sub>2</sub>O. The combined organic solutions were washed with brine, dried over anhydrous MgSO<sub>4</sub>, filtered, and concentrated *in vacuo*. Purification of the residue by flash chromatography on silica gel (30% EtOAc / hexanes) gave 5.13 g (9.32 mmol, 83%) of amide 5 as a white solid: mp 199-201 °C;  $[\alpha]^{23}_{589}$  -21.0 (*c* 1.59, CH<sub>2</sub>Cl<sub>2</sub>); IR (CH<sub>2</sub>Cl<sub>2</sub>) 3058, 2938, 2877, 1660 cm<sup>-1</sup>; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz)  $\delta$  7.20-7.47 (m, 20H), 5.60 (s, 1H), 4.42 (m, 1H), 4.20 (m, 1H), 3.67 (s, 3H), 3.39 (m, 1H), 3.21 (s, 3H), 3.18 (m, 1H), 2.98 (dd, 1H, *J* = 5.6, 15.3 Hz), 2.54 (dd, 1H, *J* = 6.0, 15.3 Hz), 1.89 (m, 2H), 1.78 (dt, 1H, *J* = 13.0 Hz), 1.44 (dt, 1H, *J* = 11.2, 12.8 Hz); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100.6 MHz)  $\delta$  171.4, 144.3, 138.6, 128.7, 128.4, 128.0, 127.7, 126.8, 126.1, 100.4, 86.4, 73.7, 73.5, 61.4, 59.0, 38.2, 37.1, 36.3, 32.0; exact mass (70eV, EI) calculated for C<sub>35</sub>H<sub>37</sub>NO<sub>5</sub>: 551.2672; found: 551.2662; R<sub>f</sub> = 0.16 (30% EtOAc / hexanes).

[25,45,65]-4-(Formylmethyl)-6-[(2-triphenylmethyloxyethyl)]-2-phenyl-1,3-dioxane (6). To a solution of 5.13 g (9.32 mmol) of amide 5 in 46 mL of CH<sub>2</sub>Cl<sub>2</sub> at -78 °C was added dropwise 8.07 mL (12.12 mmol) of a 1.5 M solution of DIBAlH in toluene. The resulting solution was stirred at -78 °C for 45 min before it was quenched by the addition of 10 mL of EtOAc followed by 50 mL of saturated Na/K tartrate solution. After stirring at room temperature for 2 h, the aqueous solution was separated and extracted with Et<sub>2</sub>O (2 x 150 mL). The combined organic solutions were washed with brine, dried over anhydrous MgSO<sub>4</sub>, filtered, and concentrated *in vacuo*. Purification of the residue by flash chromatography on silica gel (20% EtOAc / hexanes) gave 4.36 g (8.85 mmol, 95%) of aldehyde 6 as a white solid: mp 48-49 °C;  $[\alpha]^{23}_{589}$ -11.2 (*c* 3.78, CH<sub>2</sub>Cl<sub>2</sub>); IR (neat) 3086, 3058, 2946, 2917, 2874, 2731, 1725 cm<sup>-1</sup>; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz)  $\delta$  9.86 (t, 1H, *J* = 1.7 Hz), 7.22-7.50 (m, 20H), 5.61 (s, 1H), 4.44 (m, 1H), 4.22 (m, 1H), 3.42 (ddd, 1H, *J* = 4.8, 8.7 Hz), 3.19 (dt, 1H, *J* = 5.3, 9.1 Hz), 2.80 (ddd, 1H, *J* = 2.1, 7.4, 16.9 Hz), 2.59 (ddd, 1H, *J* = 1.5, 5.0, 16.9 Hz), 1.95 (m, 1H), 1.88 (m, 1H), 1.66 (dt, 1H, *J* = 2.3, 13.0 Hz), 1.47 (dt, 1H, *J* = 11.2, 13.0 Hz); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100.6 MHz)  $\delta$  200.3, 144.2, 138.2, 128.6, 128.1, 127.7, 126.9, 126.0, 100.4, 86.5, 73.6, 71.8, 58.9, 49.3, 36.7, 36.2; exact mass (70eV, EI) calculated for C<sub>33</sub>H<sub>32</sub>O<sub>4</sub>: 492.2300; found: 492.2287; R<sub>f</sub> = 0.38 (30% EtOAc / hexanes).

Methyl-(2S)-3-(benzyloxy)-2-methyl-propanoate (9). To a solution of 20.00 g (56.65 mmol) of 8 in 150 mL of anhydrous MeOH was added 2.73 g (5.66 mmol) of dry Sm(OTf)<sub>3</sub>, and the resulting clear solution was

stirred for 3 h at room temperature. The solvent was removed *in vacuo* to provide a clear oil. To this oil was added *n*-hexane which precipitated (*R*)-4-benzyl-2-oxazolidinone in 95% yield. Purification of the residue by flash chromatography on silica gel (10% EtOAc / hexanes) gave 11.43 g (54.95 mmol, 97%) of methyl ester **9** as a clear liquid:  $[\alpha]^{23}_{589}$  +12.1 (*c* 10.10, CHCl<sub>3</sub>); IR (neat) 3087, 3067, 3026, 1734 cm<sup>-1</sup>; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz)  $\delta$  7.36-7.22 (m, 5H), 3.69 (s, 3H), 4.52 (s, 2H), 3.66 (dd, 1H, *J* = 7.3, 9.1 Hz), 3.04 (dd, 1H, *J* = 5.9, 9.1 Hz), 2.79 (dqd, 1H, *J* = 5.9, 7.1, 7.3 Hz), 1.18 (d, 3H, *J* = 7.1 Hz); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100.6 MHz)  $\delta$  175.0, 138.0, 128.1, 127.4, 72.9, 71.8, 51.5, 40.0, 13.8; exact mass (70eV, CI/NH<sub>3</sub>) calculated for C<sub>12</sub>H<sub>20</sub>NO<sub>3</sub>: 226.1443; found: 226.1450; Rf = 0.30 (15% EtOAc / hexanes).

[25]-1-Benzyloxy-2-methyl-3-[(trimethylsilyl)methyl]-but-3-ene (10). In a 3-necked 250 mL round bottomed flask, powdered CeCl<sub>3.7</sub>H<sub>2</sub>O (33.96 g, 91.15 mmol) was heated under vacuum (1 mm Hg) at 160 °C for 10 h with vigorous stirring, resulting in the formation of a white mobile solid. The reaction flask was flushed with nitrogen and allowed to cool to room temperature. 140 mL of THF was added to the vigorously stirred cerium (III) chloride, forming a uniform white suspension, which was left to stir for 2 h. During this time, a separate 3-necked 100 mL flask, fitted with a condenser and a pressure equalized dropping funnel, was charged with 2.21 g (91.15 mmol) of magnesium turnings, and the whole apparatus was flame dried under a flow of nitrogen. To this flask was added dropwise a solution of ClCH<sub>2</sub>TMS (12.72 mL, 91.15 mmol) in 50 mL of THF. This mixture was stirred for 1.5 h until almost all of the magnesium was dissolved. The cerium (III) chloride suspension was cooled to -78 °C. To this suspension was added dropwise the Grignard reagent, forming an off-white suspension which was stirred at -78 °C for 1 h. Ester 9 (6.32 g, 30.38 mmol) in 15 mL of THF was added dropwise over 5 min, and the resulting mixture was warmed gradually to room temperature. When consumption of starting ester was complete by TLC, the solution was cooled to -78 °C and quenched by the addition of 5% hydrochloric acid until pH 4.0 and then allowed to warm to room temperature. The aqueous solution was separated and extracted with Et<sub>2</sub>O (2 x 100 mL). The combined organic solutions were washed with brine (2 x 50 mL) and saturated NaHCO<sub>3</sub> (2 x 50 mL), then dried over anhydrous MgSO4. The solvent was removed in vacuo to provide a slightly yellow liquid which was dissolved in 100 mL of CH<sub>2</sub>Cl<sub>2</sub>. To this solution was added 15.00 g of silica gel and 2 drops of 1% hydrochloric acid, and this mixture was stirred at room temperature until TLC indicated complete consumption of starting material. The silica gel was then removed by filtration and washed with 300 mL of  $CH_2Cl_2$ . The solvent was removed in vacuo to give a clear pale yellow liquid which was purified by flash chromatography on silica gel (2% EtOAc / hexanes) to afford 6.69 g (25.52 mmol, 84%) of allylsilane 10 as a clear liquid:  $\left[\alpha\right]_{23589}^{23}$  +6.2 (c 1.14, CH<sub>2</sub>Cl<sub>2</sub>); IR (neat) 3085, 3066, 3030, 2956, 2854, 2791, 1632 cm<sup>-1</sup>; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz) δ 7.35-7.25 (m, 5H), 4.63 (s, 1H), 4.60 (s, 1H), 4.53 (d, 1H, J = 12.1 Hz), 4.50 (d, 1H, J = 12.1 Hz), 3.52 (dd, 1H, J = 5.0, 10.1 Hz), 10.1 Hz9.1 Hz), 3.24 (dd, 1H, J = 8.1, 9.1 Hz), 2.29 (m, 1H), 1.58 (d, 1H, J = 0.9, 13.7 Hz), 1.53 (dd, 1H, J = 0.9, 13.7 Hz), 1.10 (d, 3H, J = 6.8 Hz), 0.02 (s, 9H); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100.6 MHz)  $\delta$  149.7, 138.7, 128.3, 127.5, 127.4, 106.5, 75.0, 73.0, 41.0, 26.7, 17.2, -1.3; exact mass (70eV, CI/NH<sub>3</sub>) calculated for C<sub>16</sub>H<sub>27</sub>OSi: 263.1831; found: 263.1836;  $R_f = 0.53$  (10% EtOAc / hexanes).

**2'-Methyl-2-[2R,5R]-2-hydroxyl-5-methyl-4-methylene-6-benzyloxy-hexyl-1,3-dioxolane (12).** To a solution of 6.69 g (25.52 mmol) of allylsilane **10** in 70 mL of CH<sub>2</sub>Cl<sub>2</sub> at -78 °C was added 3.28 mL (28.07 mmol) of SnCl<sub>4</sub> dropwise. The resulting solution was stirred at -78 °C for 1 h, then aldehyde **11** (3.98 g, 30.62 mmol) in 20 mL of CH<sub>2</sub>Cl<sub>2</sub> was added dropwise. This mixture was stirred at -78 °C for 30 min and then quenched by the slow addition of 2 mL of Et<sub>3</sub>N, followed by 100 mL of saturated NH<sub>4</sub>Cl solution. The aqueous solution was separated and extracted with CH<sub>2</sub>Cl<sub>2</sub> (2 x 50 mL). The combined organic solutions were washed with brine, dried over anhydrous MgSO<sub>4</sub>, filtered, and concentrated *in vacuo*. Purification of the residue by flash chromatography on silica gel (30% EtOAc / hexanes) gave 8.00 g (25.00 mmol, 98%) of homoallylic alcohol **12** as a clear oil:  $[\alpha]^{23}_{589}$  +4.3 (*c* 1.85, CH<sub>2</sub>Cl<sub>2</sub>); IR (neat) 3518, 2981, 2930, 2881 cm<sup>-1</sup>; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz)  $\delta$  7.35-7.25 (m, 5H), 4.90 (s, 2H), 4.52 (d, 1H, *J* = 12.3 Hz), 4.48 (d, 1H, *J* = 12.3 Hz), 4.07 (m, 1H), 3.97 (m, 4H), 3.51 (s, 1H), 3.49 (dd, 1H, *J* = 6.5, 9.1 Hz), 3.32 (dd, 1H, *J* = 7.1, 9.1 Hz), 2.48 (s, 1H), 2.27 (dd, 1H, *J* = 7.1, 14.2 Hz), 2.13 (dd, 1H, *J* = 6.9 Hz); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100.6 MHz)  $\delta$  148.6,

138.4, 128.2, 127.5, 127.4, 111.6, 110.1, 74.5, 72.9, 66.2, 64.5, 64.2, 44.4, 43.5, 39.2, 24.0, 17.2; exact mass (70eV, CI/NH<sub>3</sub>) calculated for  $C_{19}H_{32}NO_4$ : 338.2331; found: 338.2334;  $R_f = 0.26$  (30% EtOAc / hexanes).

2'-Methyl-2-[25,5R]-2-(4-nitrobenzoyl)-5-methyl-4-methylene-6-benzyloxy-hexyl-1,3-dioxolane (12a). To a mechanically stirred solution of 8.00 g (25.00 mmol) of alcohol 12, 20.20 g (75.00 mmol) of triphenylphosphine and 11.70 g (70.00 mmol) of p-nitrobenzoic acid in 1 L of toluene at 0 °C was added dropwise 17.28 g (75.00 mmol) of di-tert-butylazodicarboxylate. After approximately 5 min the slightly orange solution became heterogeneous. This off-white suspension was then vigorously stirred at 0 °C for 12 h. The volatile components were then removed in vacuo and the residue purified by flash chromatography on silica gel (EtOAc/hexanes/Et<sub>3</sub>N, 10/90/1) to provide 9.26 g (19.75 mmol, 79%) of ester 12a as a pale yellow oil:  $[\alpha]^{23}_{589}$  +4.1 (c 2.55, CH<sub>2</sub>Cl<sub>2</sub>); IR (neat) 3110, 3082, 3030, 2981, 2931, 2879, 1947, 1810, 1720, 1645, 1607  $cm^{-1}$ ; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz)  $\delta$  8.26 (dt, 2H, J = 2.0, 9.0 Hz), 8.17 (dt, 2H, J = 1.9, 9.0 Hz), 7.36-7.20 (m, 5H), 5.59 (m, 1H), 4.88 (d, 1H, J = 0.9 Hz), 4.87 (s, 1H), 4.48 (s, 2H), 3.92-3.79 (m, 4H), 3.46 (dd, 1H, J = 6.2, 9.2 Hz), 3.32 (dd, 1H, J = 6.9, 9.2 Hz), 2.54 (m, 1H), 2.48 (dd, 1H, J = 7.6, 14.6 Hz), 2.44 (dd, 1H, J = 6.2, 9.2 Hz), 2.54 (m, 1H), 2.48 (dd, 1H, J = 7.6, 14.6 Hz), 2.44 (dd, 1H, J = 6.2, 9.2 Hz), 2.54 (m, 1H), 2.48 (dd, 1H, J = 7.6, 14.6 Hz), 2.44 (dd, 1H, J = 6.2, 9.2 Hz), 2.54 (m, 1H), 2.48 (dd, 1H, J = 7.6, 14.6 Hz), 2.44 (dd, 1H, J = 6.2, 9.2 Hz), 2.54 (m, 1H), 2.48 (dd, 1H, J = 7.6, 14.6 Hz), 2.44 (dd, 1H, J = 6.2, 9.2 Hz), 2.44 (dd, 1H, J = 6.2, 9.2 Hz), 2.54 (m, 1H), 2.48 (dd, 1H, J = 7.6, 14.6 Hz), 2.44 (dd, 1H, J = 6.2, 9.2 Hz), 2.54 (m, 1H), 2.48 (dd, 1H, J = 7.6, 14.6 Hz), 2.44 (dd, 1H, J = 6.2, 9.2 (dd), 2.44 (dd), 5.8, 14.6 Hz), 2.14 (dd, 1H, J = 8.1, 15.0 Hz), 2.04 (dd, 1H, J = 3.3, 15.0 Hz), 1.32 (s, 3H), 1.08 (d, 3H, J = 6.9 Hz); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100.6 MHz) δ 164.0, 150.3, 147.4, 138.4, 136.2, 130.5, 128.2, 127.4, 123.4, 112.6, 108.6, 74.7, 72.9, 70.4, 64.5, 64.4, 42.5, 41.4, 39.1, 24.3, 16.9; Exact mass (70eV, CI/NH3) calculated for  $C_{26}H_{32}NO_7$ ; 470.2179; found: 470.2192;  $R_f = 0.44$  (30% EtOAc / hexanes). **2'-Methyl-2-[2S,5R]-2-hydroxyl-5-methyl-4-methylene-6-benzyloxy-hexyl-1,3-dioxolane (13).** To a solution of 9.26 g (19.75 mmol) of ester **12a** in 80 mL of MeOH was added 7 mL of water. To this solution was added 3.00 g (21.71 mmol) of K<sub>2</sub>CO<sub>3</sub> and the resulting mixture was stirred at room temperature for 6 h. The volatiles were then removed *in vacuo*, and the residue purified by flash chromatography on silica gel (30% EtOAc / hexanes) to provide 6.26 g (19.55 mmol, 99%) of homoallylic alcohol **13** as a clear oil:  $[\alpha]^{23}_{589}$  -2.0 (*c* 2.74, CH<sub>2</sub>Cl<sub>2</sub>); IR (neat) 3519, 3065, 3030, 2880, 1952, 1874, 1810, 1729, 1642, 1604 cm<sup>-1</sup>; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz)  $\delta$  7.36-7.22 (m, 5H), 4.90 (m, 2H), 4.52 (d, 1H, *J* = 12.3 Hz), 4.48 (d, 1H, *J* = 12.3 Hz), 4.06 (m, 1H), 3.98 (m, 4H), 3.51 (s, 1H), 3.48 (dd, 1H, *J* = 6.2, 9.2 Hz), 3.32 (dd, 1H, *J* = 7.2, 9.2 Hz), 2.49 (m, 1H), 2.27 (dd, 1H, *J* = 7.3, 14.4 Hz), 2.12 (dd, 1H, *J* = 6.9 Hz); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100.6 MHz)  $\delta$  148.6, 138.4, 128.2, 127.44, 127.35, 111.6, 110.1, 74.5, 72.8, 66.4, 64.5, 64.2, 44.5, 43.2, 39.5, 24.0, 17.1; exact mass (70eV, CI/NH<sub>3</sub>) calculated for C<sub>19</sub>H<sub>32</sub>NO<sub>4</sub>: 338.2331; found: 338.2334; R<sub>f</sub> = 0.26 (30% EtOAc / hexanes). Anal. Calcd. for C<sub>19</sub>H<sub>28</sub>O<sub>4</sub>; C, 71.25; H, 8.75; found: C, 71.07; H, 8.81.

[4S,7R]-Hydroxyl-6-methylene-7-methyl-8-benzyloxy-octa-2-one (13a). To a solution of 6.26 g (19.55 mmol) of alcohol 13 in 100 mL of wet acetone was added 0.422 g (1.95 mmol) of pyridinium *p*-toluenesulfonate (PPTS). The resulting solution was refluxed for 5 h. The volatile components were then removed *in vacuo*. The residue was dissolved in 50 mL of Et<sub>2</sub>O and washed with 25 mL of saturated aqueous NaHCO<sub>3</sub> and 25 mL of brine. The organic phase was dried over MgSO<sub>4</sub>, filtered, and concentrated *in vacuo*. Purification of the residue by flash chromatography on silica gel (30% EtOAc / hexanes) gave 5.29 g (19.16 mmol, 98%) of methyl ketone 13a as a clear oil:  $[\alpha]^{23}_{589}$  +18.2 (*c* 1.52, CH<sub>2</sub>Cl<sub>2</sub>); IR (neat) 3444, 3066, 3030, 2962, 2872, 1955, 1870, 1810, 1714, 1643 cm<sup>-1</sup>; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz)  $\delta$  7.36-7.25 (m, 5H), 4.95 (d, 1H, *J* = 0.6 Hz), 4.92 (d, 1H, *J* = 1.1 Hz), 4.49 (s, 2H), 4.20 (m, 1H), 3.45 (dd, 1H, *J* = 7.4, 8.8 Hz), 3.36 (dd, 1H, *J* = 6.3, 8.8 Hz), 3.08 (d, 1H, *J* = 2.9 Hz), 2.60 (dd, H, *J* = 4.0, 17.1 Hz), 2.55 (dd, H, *J* = 8.2, 17.1 Hz), 2.50 (m, 1H), 2.21 (d, 2H, *J* = 6.4 Hz), 2.13 (s, 3H), 1.06 (d, 3H, *J* = 6.9 Hz); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100.6 MHz)  $\delta$  209.1, 148.5, 138.1, 128.2, 127.5, 127.4, 112.2, 74.5, 72.9, 66.3, 49.6, 42.7, 39.4, 30.6, 17.1; exact mass (70eV, CI/NH<sub>3</sub>) calculated for C<sub>17</sub>H<sub>28</sub>NO<sub>3</sub>: 294.2069; found: 294.2066; Rf = 0.19 (30% EtOAc / hexanes).

[4S,7R]-4-Triethylsiloxy-6-methylene-7-methyl-8-benzyloxy-octa-2-one (14). To a solution of 5.29 g (19.16 mmol) of methyl ketone 13a in 77 mL of  $CH_2Cl_2$  at -78 °C was added 4.46 mL (38.32 mmol) of 2,6-lutidine. To this solution was added dropwise 4.46 mL (21.07 mmol) of triethyltrifluoromethanesulfonate, and the resulting solution was stirred at -78 °C for 20 min. The solution was diluted with 120 mL of a 3:1 mixture of *n*-hexane/CH<sub>2</sub>Cl<sub>2</sub> and then quenched by the addition of 25 mL of saturated aqueous NaHCO<sub>3</sub> solu-

tion. The aqueous solution was separated and extracted with 2 x 30 mL of CH<sub>2</sub>Cl<sub>2</sub>. The combined organic solutions were washed with 90 mL of 0.5 M aqueous NaHSO<sub>4</sub> solution. The aqueous phase was extracted with 20 mL of CH<sub>2</sub>Cl<sub>2</sub>, and the combined organic extracts were dried over MgSO<sub>4</sub>, filtered, and concentrated *in vacuo*. Purification of the residue by flash chromatography on silica gel (5% EtOAc / hexanes) gave 7.25 g (18.58 mmol, 97%) of protected methyl ketone 14 as a pale green oil:  $[\alpha]^{23}_{589}$  +17.7 (*c* 1.38, CH<sub>2</sub>Cl<sub>2</sub>); IR (neat) 3077, 3066, 3030, 2954, 2867, 1715, 1643 cm<sup>-1</sup>; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz)  $\delta$  7.35-7.25 (m, 5H), 4.87 (s, 1H), 4.83 (d, 1H, *J* = 1.0 Hz), 4.52 (d, 1H, *J* = 12.2 Hz), 4.48 (d, 1H, *J* = 12.2 Hz), 4.35 (m, 1H), 3.47 (dd, 1H, *J* = 6.1, 9.2 Hz), 3.31 (dd, 1H, *J* = 7.2, 9.2 Hz), 2.57 (dd, H, *J* = 4.6, 15.8 Hz), 2.51 (dd, H, *J* = 7.3, 15.8 Hz), 2.44 (m, 1H), 2.31 (dd, 1H, *J* = 5.1, 14.1 Hz), 2.15 (ddd, 1H, *J* = 0.6, 8.1, 14.1), 2.10 (s, 3H), 1.08 (d, 3H, *J* = 6.9 Hz), 0.93 (t, 9H, *J* = 7.7 Hz), 0.58 (q, 6H, *J* = 7.7 Hz); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100.6 MHz)  $\delta$  207.5, 148.2, 138.4, 128.1, 127.4, 127.3, 111.9, 74.3, 72.8, 67.7, 50.3, 43.6, 39.4, 31.3, 17.0, 6.7, 5.0; exact mass (70eV, CI/NH<sub>3</sub>) calculated for C<sub>23</sub>H<sub>42</sub>NO<sub>3</sub>Si: 408.2934; found: 408.2945; Rf = 0.63 (30% EtOAc / hexanes). [2R,5S,9RS,10(4S,6S)]-1-[(Phenyl)-methoxy]-2-(methyl)-3-(methylene)-5-(triethylsiloxy)-9-(hydroxy)-10-[2-phenyl-4-(triphenylmethyloxy)-ethyl-1,3-dioxan-6-yl]-decan-7-one (15). To a solution of 3.625 g (9.29 mmol) of methyl ketone 14 in 20 mL of CH2Cl2 at -78 °C were added 2.3 mL (13.0 mmol) of diisopropylethylamine and 2.80 mL (11.25 mmol) of di-n-butyl-boron triflate. The resulting mixture was maintained at -78 °C for 45 min, producing a light yellow solution. To this enolate solution was added 4.13 g (8.40 mmol) of aldehyde 6 as a solution in 17 mL of  $CH_2Cl_2$ . The mixture was stirred at -78 °C for 2 h and quenched by the addition of 15 mL of a 1:1 mixture of pH 7 phosphate buffer and MeOH. The mixture was warmed to 0  $^{\circ}$ C and maintained at this temperature for an additional 15 min. A solution of 10 mL of 30% agueous H<sub>2</sub>O<sub>2</sub> in 10 mL of MeOH was added slowly, and the resulting solution was allowed to stir at 0 °C for 1 h. After removal of the organic solvents in vacuo, 50 mL of saturated aqueous NaHCO3 was added, and the mixture was extracted with 3 x 60 mL of  $CH_2Cl_2$ . The combined organic extracts were dried over MgSO<sub>4</sub>, filtered and concentrated in vacuo to give a yellow oil. Purification by flash chromatography on silica gel (15% EtOAc / hexanes) gave 5.85 g (6.34 mmol, 79% based on aldehyde 6) of a 1:1 mixture of aldol products 15 as a clear oil: IR (neat) 3527, 3086, 3060, 3032, 1707, 1641 cm<sup>-1</sup>; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz) & 7.48-7.20 (m, 25H), 4.86 (s, 1H), 5.55 (m, 1H), 4.82 (s, 1H), 4.49 (s, 2H), 4.37 (m, 2H), 4.16 (m, 2H), 3.47 (dd, 1H, J = 6.4, 9.1Hz), 3.39 (m, 1H), 3.30 (dd, 1H, J = 7.1, 9.1 Hz), 3.14 (m, 1H), 2.48-2.64 (m, 4H), 2.43 (m, 1H), 2.32 (dd, 1H), 2.43 (m, 1H), 2.44 (m, 1H), J = 4.8, 14.2 Hz), 2.14 (dd, 1H, J = 8.5, 14.1 Hz), 1.92 (m, 1H), 1.88 (m, 1H), 1.67-1.56 (m, 3H), 1.53 (m, 2H), 1.54 (m, 2H), 1.54 (m, 2H), 1.54 (m, 2H), 1.54 (m, 2H), 1.55 (m, 2 1H), 1.41 (m, 1H), 1.08 (d, 3H, J = 6.9 Hz), 0.93 (t, 9H, J = 8.0 Hz), 0.59 (q, 6H, J = 8.0 Hz); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100.6 MHz)  $\delta$  211.0, 210.0, 200.3, 148.2, 144.3, 144.2, 138.7, 138.5, 138.4, 128.6, 128.4, 128.3, 128.1, 128.0, 127.7, 127.5, 126.8, 126.0, 112.1, 100.4, 100.2, 86.4, 75.6, 74.3, 73.8, 73.3, 72.9, 67.8, 65.7, 64.0, 59.1, 59.0, 51.0, 50.9, 50.3, 50.1, 43.7, 43.6, 42.4, 41.3, 39.6, 37.3, 36.9, 36.3, 17.2, 6.8, 4.9; exact mass (70 eV, FAB/NaI) calculated for  $C_{56}H_{70}O_7SiNa$ : 905.4789; found: 905.4840;  $R_f = 0.49$  (30% EtOAc / hexanes). [2R,2(3R),4S,6R,8S,10S]-8-[2-(*tert*-Butyldimethylsiloxy)ethyl]-2-[2-methylen-3-methyl-4-(phenylmethoxy)-butyl]-10-hydroxy-4-methyl-1,7-dioxaspiro[5.5]-undecan-4-ol (19). A 2-necked 50 mL flask containing 0.705 g (1.893 mmol) of powdered CeCl<sub>3</sub>•7H<sub>2</sub>O was heated under vacuum (1 mm Hg) at 160 °C for 12 h with vigorous stirring, resulting in the formation of a white mobile solid. The reaction flask was flushed with nitrogen and allowed to cool to room temperature. THF (5 mL) was added to the vigorously stirred cerium (III) chloride to form a uniform white suspension which was allowed to stir at room temperature for 2 h. To the cooled mixture (-78 °C) was added dropwise 1.13 mL (1.17 mmol) of a 1.4 M solution of MeLi in THF to form an off-white suspension which was stirred at -78 °C for 1.5 h. To this suspension was added dropwise a solution of 0.336 g (0.631 mmol) of spiroketal 18 in 5 mL of THF, and the resulting mixture was stirred at -78  $^{\circ}$ C for 1 h. After this, the mixture was diluted with 20 mL of Et<sub>2</sub>O, quenched by the slow addition of 10 mL of a saturated solution of NH<sub>4</sub>Cl and allowed to warm to room temperature. The aqueous solution was separated and extracted with 2 x 20 mL of Et2O. The combined organic solutions were washed with brine, dried over anhydrous MgSO<sub>4</sub>, filtered, and concentrated *in vacuo*. Purification of the residue by flash chromatography on silica gel (20% EtOAc / hexanes) afforded 0.300 g (0.548 mmol, 87%) of axial alcohol 19 as a clear oil:  $[\alpha]^{23}_{589}$  -17.8 (c 2.20, CH<sub>2</sub>Cl<sub>2</sub>); IR (neat) 3518, 3086, 3064, 3031, 2930, 2739, 2710, 1644, 1604 cm<sup>-1</sup>; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 500 MHz)  $\delta$  7.36-7.25 (m, 5H), 4.98 (s, 2H), 4.51 (d, 1H, J = 12.2 Hz), 4.46 (d, 1H, J = 12.2 Hz), 4.46 (d, 1H, J = 12.2 Hz) Hz), 4.30 (s, 1H), 4.08 (m, 1H), 3.99 (m, 2H), 3.93 (d, 1H), 3.76-3.69 (m, 2H), 3.44 (dd, 1H, J = 5.7, 9.1 Hz), 3.28 (dd, 1H, J = 7.0, 9.1 Hz), 2.48 (m, 1H), 2.29 (dd, 1H, J = 3.8, 14.4 Hz), 2.22 (dd, 1H, J = 9.1, 14.3 Hz), 1.83-1.66 (m, 6H), 1.62 (dd, 1H, J = 3.4, 14.0 Hz), 1.48 (m, 1H, J = 13.8 Hz), 1.47 (d, 1H, J = 14.0 Hz), 1.29 $(dd, 1H, J = 11.7, 13.4 Hz), 1.17 (s, 3H), 1.14 (d, 3H, J = 6.9 Hz), 0.87 (s, 9H), 0.05 (s, 3H), 0.04 (s, 3H); {}^{13}C$ NMR (CDCl<sub>3</sub>, 100.6 MHz) δ 148.2, 138.6, 128.4, 127.61, 127.55, 112.4, 100.3, 75.2, 73.1, 67.8, 64.9, 64.5, 63.0, 60.1, 45.6, 43.8, 42.1, 40.0, 39.00, 38.97, 38.1, 30.1, 26.1, 18.5, 16.8; exact mass (70 eV, FAB/NaI) calculated for  $C_{31}H_{52}O_6SiNa$ : 571.3431; found: 571.3445;  $R_f = 0.37$  (30% EtOAc / hexanes). [2R,2(3R),4S,6R,8S,10S]-8-(2-tert-Butyldimethylsiloxy)ethyl]-2-[2-methylen-3-methyl-4-hydroxybutyl]-10-triethylsiloxy-4-triethylsiloxy-4-methyl-1,7-dioxaspiro[5.5]undecan-4-ol (20). To a -78 °C solution of 19 (0.692 g, 1.25 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (20 mL) were added 2,6-lutidine (0.436 mL, 3.75 mmol) and triethylsilyl trifluoromethanesulfonate (0.636 mL, 2.81 mmol). Upon completion, the reaction was diluted with saturated aqueous NaHCO<sub>3</sub> and  $Et_2O$ , then warmed to room temperature. The organic solution was separated, washed with saturated aqueous NH<sub>4</sub>Cl and brine, dried over MgSO<sub>4</sub>, filtered, and concentrated. The residue was purified by flash chromatography (150 g SiO<sub>2</sub>, 10 % EtOAc/hexanes) to give 0.725 g of the silvl ether, which was used immediately in the following reaction. A solution of di-tert-butylbiphenyl (2.76 g, 10.38 mmol) in THF (20 mL) was treated with several small pieces of cut and crushed (with pliers) lithium wire (0.080 g, 11.42 mmol) at room temperature. The mixture was sonicated (with cooling to maintain temperature 10-25 °C) for 5 h to produce a deep green radical anion solution. In a separate flask, a solution of the benzyl ether (0.725 g, 0.930 mmol) in THF (15 mL) was cooled to -78 °C. The radical anion solution was added to the substrate portionwise (ca. 10 mL) until the green-blue color persisted. The solution was stirred for 15 min at -78 °C and carefully quenched with saturated aqueous NH<sub>4</sub>Cl solution. The cold bath was removed and the mixture warmed to room temperature. The mixture was extracted with Et<sub>2</sub>O (2 x 30 mL). The combined organic solutions were washed with saturated aqueous  $NH_4Cl$  (10 mL) and brine (10 mL), then dried over MgSO<sub>4</sub>, filtered, and concentrated. The residue was purified by flash chromatography (150 g SiO<sub>2</sub>, 20 % EtOAc/ hexanes) to give 0.533 g (62% from 19) of the alcohol 20:  $[\alpha]^{23}_{589}$  -39.2 (c 3.3, CHCl<sub>3</sub>) IR (neat) 3460, 2957, 2878, 1636 cm<sup>-1</sup>; <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) & 4.99 (s, 1H), 4.92 (s, 1H), 4.23-4.17 (m, 1H), 4.13-4.07 (m, 1H), 4.03-3.99 (m, 1H), 3.76-3.62 (m, 2H), 2.45-2.37 (m, 1H), 2.27-2.22 (dd, J = 14.5, 6.8 Hz, 1H), 2.13-2.08 (dd, J = 14.5, 6.1 Hz, 1H), 1.92-1.90 (m, 1H), 1.82-1.73 (m, 2H), 1.67-1.45 (m), 1.27-1.24 (d, J = 14.1 Hz, 1H), 1.82-1.73 (m, 2H), 1.67-1.45 (m), 1.27-1.24 (d, J = 14.1 Hz, 1H), 1.82-1.73 (m, 2H), 1.67-1.45 (m), 1.27-1.24 (d, J = 14.1 Hz, 1H), 1.82-1.73 (m, 2H), 1.67-1.45 (m), 1.27-1.24 (d, J = 14.1 Hz, 1H)1H), 1.19 (s, 3H), 1.03-1.01 (d, J = 7.0 Hz, 3H), 0.96-0.92 (m, 18H), 0.88 (s, 9H), 0.60-0.54 (m, 12H), 0.04 (s, 12H), 0.96-0.92 (m, 18H), 0.88 (s, 9H), 0.60-0.54 (m, 12H), 0.04 (s, 12H), 0.96-0.92 (m, 18H), 0.88 (s, 9H), 0.60-0.54 (m, 12H), 0.94 (s, 12H), 0.96-0.92 (m, 18H), 0.88 (s, 9H), 0.60-0.54 (m, 12H), 0.94 (s, 12H), 0.96-0.92 (m, 18H), 0.88 (s, 9H), 0.60-0.54 (m, 12H), 0.94 (s, 12H), 0.96-0.92 (m, 18H), 0.88 (s, 9H), 0.60-0.54 (m, 12H), 0.94 (s, 12H), 0.94 (s, 12H), 0.96-0.92 (m, 18H), 0.88 (s, 9H), 0.88 (s, 9H), 0.88 (s, 12H), 0.94 (s, 12H), 0 6H); <sup>13</sup>C NMR (101 MHz, CDCl<sub>3</sub>) δ 148.4, 112.0, 97.3, 70.5, 65.9, 65.3, 64.8, 62.0, 60.3, 48.1, 44.8, 43.1, 43.0, 39.3, 38.7, 32.2, 25.9, 18.2, 16.2, 7.2, 6.9, 6.8, 4.8, -5.2; exact mass calcd for C<sub>36</sub>H<sub>74</sub>O<sub>6</sub>Si<sub>3</sub>Na: 709.4691; found 709.4690 (FAB, MNBA, added NaI); Rr=0.61 (20% EtOAc/ hexanes).

[2R,2(3R),4S,6R,8S,10S]-8-(2-tert-Butyldimethylsiloxy)ethyl]-2-[2-methylen-3-methyl-butan-4-al]-10-triethylsiloxy-4-triethylsiloxy-4-methyl-1,7-dioxaspiro[5.5]undecan-4-ol (21). A solution of Dess-Martin periodinane (0.061 g, 0.142 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (2 mL) was prepared under an inert atmosphere (weighed in dry box) and treated with pyridine (0.096 mL, 0.094 g, 1.19 mmol). After stirring for 5 min, a solution of alcohol 20 (0.092 g, 0.137 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (1 mL) was added. The clear, yellow solution was stirred for 40 min. The solution was quenched with 1M Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>/saturated aqueous NaHCO<sub>3</sub> (0.5 mL/0.5 mL). The mixture was extracted with Et<sub>2</sub>O (2 x 10 mL). The combined organic solutions were washed with saturated aqueous NaHCO<sub>3</sub> (2 x 5 mL) and brine (5 mL). The organic solution was dried over MgSO<sub>4</sub>, filtered, and concentrated. The residue (0.093 g, 100%) was used without further purification Partial data for the unpurified aldehyde **21**: IR (neat) v 2955, 2872, 2717, 1722, 1639 cm<sup>-1</sup>; <sup>1</sup>H NMR (400 MHz, C<sub>6</sub>D<sub>6</sub>)  $\delta$  9.61 (s, 1H) 5.13 (s, 1H), 4.86 (s, 1H), 4.36-4.31 (m, 2H), 3.96-3.94 (t, *J* = 3.4 Hz), 3.90-3.77 (m, 2H), 3.19-3.14 (q, *J* = 6.9 Hz, 1H), 2.41-2.36 (dd, *J* = 14.3, 6.4 Hz, 1H), 2.19-2.14 (dd, *J* = 14.3, 6.0 Hz, 1H), 2.02-1.94 (m, 1H), 1.75-1.63 (m, 4H), 1.45-1.34 (m, 1H), 1.22-1.21 (d, *J* = 6.9 Hz, 3H), 1.16-1.12 (d, *J* = 14.0 Hz, 1H), 1.10-0.96 (m, 27 H), 0.71-0.57 (m, 12H); <sup>13</sup>C NMR (101 MHz, C<sub>6</sub>D<sub>6</sub>)  $\delta$  199.9, 144.7, 115.0, 97.3, 70.7, 65.4, 65.1, 62.0, 60.6, 53.5, 48.4, 45.0, 43.2, 41.9, 39.8, 39.0, 32.3, 26.1, 18.4, 13.4, 7.5, 7.2, 7.1, 5.1, 1.3, -5.0, -5.1; Rf=0.60 (20% EtOAc/ hexanes).

[2R]-1-Triphenylmethoxy-2-hydroxy-4-pentene (23). A suspension of CuI (37.42 g, 197 mmol) in THF (480 mL) was cooled to -78 °C and treated with a solution of vinylmagnesium bromide (394.1 mL of a 1M solution in THF, 394.1 mmol) maintaining an internal temperature below -70 °C. After the addition was complete, the light-brown slurry was stirred for 1 h at -78 °C. A solution of 22 (31.16 g, 98.6 mmol) in THF (250 mL) was added via an addition funnel over 30 min. The resulting slurry was stirred at -78 °C for 90 min. The cold bath was removed and the mixture was warmed to -20 °C (mixture discolors to a dark brown color). A mixture of saturated aqueous NH<sub>4</sub>Cl and NH<sub>4</sub>OH (600 mL/600 mL) was cautiously added (vigorous evolution of ethylene gas). After foaming had subsided, Et<sub>2</sub>O (1200 mL) was added and the mixture stirred for 12 h. The biphasic mixture was separated. The aqueous portion was extracted with  $Et_2O$  (2 x 500 mL). The combined organic solutions were washed with brine, dried over anhydrous MgSO4, filtered and concentrated in vacuo. Purification of the residue by flash chromatography (500 g SiO<sub>2</sub>, 10% EtOAc / hexanes) afforded 32.54 g (96%) of alcohol 23 as a clear oil:  $[\alpha]^{23}_{589}$  -1.0 (c 1.39, CHCl<sub>3</sub>); IR (neat) 3578, 2925, 1956, 1820, 1640 cm<sup>-1</sup>; <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>) δ 7.46-7.43 (m, 5H), 7.34-7.24 (m, 10H), 5.75 (m, 1H), 5.06 (m, 2H), 3.85 (m, 1H), 3.21-3.16 (dd, J = 9.2, 5.2 Hz, 1H), 3.12-3.07 (dd, J = 9.2, 6.8 Hz, 1H), 2.25 (m, 2H); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 125 MHz) § 143.8, 134.3, 128.6, 127.8, 127.0, 117.5, 86.7, 70.2, 67.1, 38.1; exact mass (EI) calculated for  $C_{24}H_{28}O_2N$ : 362.2120; found 362.2131;  $R_f = 0.26$  (15% EtOAc / hexanes).

[2E,5R]-5-Hydroxy-6-(triphenylmethyloxy)-N-methyl-N-methoxy-2-hexenamide (24). A solution of alkene 23 (25.37 g, 73.9 mmol) in dichloromethane (750 mL) was treated with several crystals of Sudan Red (ca. 20 mg). The pale red solution was cooled to -78 °C. Ozone was bubbled through the solution until the red color dissipated (40 min). The solution was purged with N<sub>2</sub> for 20 min. Triphenylphosphine (19.36 g, 73.9 mmol) was added and the cold bath removed. After stirring for 5 h at room temperature, N-methoxy-Nmethyl-(triphenylphosphoranylidene)acetamide (26.83 g, 73.9 mmol) was added producing a slight exotherm  $(22 \rightarrow 28 \text{ °C})$ . The yellow solution was stirred for 14 h at ambient temperature. The solution was concentrated to an oil. The residue was initially purified by flash chromatography (1.25 kg SiO<sub>2</sub>;  $30 \rightarrow 50\%$ EtOAc/hexanes) to give the product 24 mixed with triphenylphosphine oxide. This material was concentrated to a paste and triturated with hexanes. The solid mass was washed with  $Et_2O$ /hexanes (1:1). The combined extracts were concentrated and chromatographed (750 g SiO2; 50% EtOAc/hexanes) to give 23.1 g (73%) of the product **24** as a white solid:  $[\alpha]^{23}_{589}$  +2.0 (c 2.62, CHCl<sub>3</sub>); IR (neat) 3405, 3059, 3006, 1661, 1623 cm<sup>-1</sup>; <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>)  $\delta$  7.44-7.41 (m, 6H), 7.32-7.21 (m, 9H), 6.94-6.86 (dt, J = 7.3, 15.4 Hz, 1H), 6.96-6.42 (d, J = 15.4 Hz, 1H), 3.92-3.87 (m, 1H), 3.64 (s, 3H), 3.21 (s, 3H), 3.21-3.09 (m, 2H), 2.43-2.39 (m, 2H), 2.43-2.39 (m, 2H), 2.43-2.39 (m, 2H), 3.21-3.09 (m, 2H), 2.43-2.39 (m, 2H), 3.21-3.09 (m, 2H), 3.2H); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 101 MHz) δ 166.5, 143.7, 142.9, 128.5, 127.8, 127.1, 121.1, 86.7, 77.2, 69.7, 67.1, 61.6, 36.7, 32.3; exact mass (FAB) calculated for  $C_{27}H_{29}O_4Na$ : 454.1994; found 454.1998;  $R_f = 0.26$  (15%) EtOAc / hexanes).

[2R, 4S, 6S]-4-(N-methoxy-N-methyl-carboxamidomethyl)-6-[(triphenylmethyloxy)methyl]-2-phenyl-1,3-dioxane (25). A solution of the amide 24 (22.75 g, 52.78 mmol) in THF (530 mL) was cooled to 0 °C. The solution was treated with freshly distilled benzaldehyde (3 portions x 5.84 mL, 58 mmol) and potassium *tert*-butoxide (3 x 0.592 g, 5.28 mmol) at 1 h intervals. After stirring for an additional 30 min, saturated aqueous NH<sub>4</sub>Cl solution (200 mL) was added. The mixture was extracted with  $Et_2O$  (2 x 500 mL). The combined organic solutions were washed with saturated aqueous NH<sub>4</sub>Cl (300 mL) and brine (300 mL). The organic solution was dried over MgSO<sub>4</sub>, filtered, and concentrated. The residue was purified by flash chromatography (1 kg SiO<sub>2</sub>, 30 $\rightarrow$ 70% EtOAc/hexanes) to give 19.1 g (76%) of the benzylidene acetal **25** and 2.8 g (12%) of the starting carbinol **24**. [2*R*,4*S*,6*S*]-4-(Propan-2-one)-6-[(triphenylmethyloxy)methyl]-2-phenyl-1,3-dioxane (26). A solution of the amide 25 (10.0 g, 18.69 mmol) in THF (180 mL) was cooled to -78 °C and treated with a solution of methyllithium in Et<sub>2</sub>O (40.0 mL of a 1.4 M solution in Et<sub>2</sub>O, 56 mmol) over 30 min. After stirring for 90 min at -78 °C, the solution was cautiously quenched by the addition of a saturated aqueous solution of NH<sub>4</sub>Cl (40 mL). The cold bath was removed and the mixture warmed to room temperature. The mixture was extracted with Et<sub>2</sub>O (2 x 150 mL). The combined organic solutions were washed with saturated aqueous NH<sub>4</sub>Cl (100 mL) and brine (100 mL). The organic solution was dried over MgSO<sub>4</sub>, filtered, and concentrated. The residue was purified by flash chromatography (600 g SiO<sub>2</sub>; 15→20% EtOAc/hexanes) to give 7.47 g (81%) of the methyl ketone 26 as a white foam. [ $\alpha$ ]<sup>23</sup><sub>589</sub> +25.6 (*c* 1.96, CHCl<sub>3</sub>); IR (neat) *v* 3070, 3022, 2917, 2869, 1716 cm<sup>-1</sup>; <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  7.54-7.22 (m, 20H), 5.59 (s, 1H), 4.39-4.35 (m, 1H), 4.15-4.12 (m, 1H), 3.38-3.34 (dd, *J* = 5.7, 9.5 Hz, 1H), 3.12-3.08 (dd, *J* = 5.7, 9.5 Hz, 1H), 2.92-2.86 (dd, *J* = 16.3, 7.2 Hz, 1H), 2.59-2.54 (dd, *J* = 16.3, 5.2 Hz, 1H) 2.21 (s, 3H), 1.76-1.73 (d, *J* = 12.9 Hz, 1H), 1.58-1.49 (m, 1H); <sup>13</sup>C NMR (101 MHz, CDCl<sub>3</sub>)  $\delta$  206.4, 143.9, 138.3, 128.6, 128.1, 127.7, 126.9, 125.9, 100.4, 86.4, 75.7, 72.8, 66.5, 49.4, 33.6, 31.1; exact mass calcd for C<sub>33</sub>H<sub>32</sub>O<sub>4</sub>Na: 515.2199; found 515.2187 (FAB, MNBA, added NaI); R<sub>f</sub>=0.24 (20% EtOAc/ hexanes).

(1S)-1-(-2-Napthyl)ethyl(3S,5S)-3-tert-Butyldimethylsilyloxy-5-hydroxy-8-[2-phenyl-4-(R)-triphenylmethyloxy)-methyl-1,3-dioxan-6-(S)-yl]-octan-7-on-1-oic acid (28). A solution of the methyl ketone 26 (7.15 g, 14.53 mmol) in Et<sub>2</sub>O (250 mL) was slowly cooled to -78 °C (rapid cooling precipitates methyl ketone 26). To this solution was added Hunig's base (2.76 mL, 16.27 mmol). After stirring for 5 min, neat Bu<sub>2</sub>BOTf (3.81 mL) was added dropwise. The resulting white suspension was stirred for 45 min at -78 °C. The reaction mixture was cooled to -110 °C (internal temperature monitoring) by immersion in an Et<sub>2</sub>O/liquid N<sub>2</sub> bath. A solution of the aldehyde (S)-27 (6.50 g, 16.27 mmol) in Et<sub>2</sub>O (50 mL) was added by cannula. After stirring for 45 min at -110 °C, the solution was warmed to -78 °C and stirred at this temperature for 45 min. The solution was quenched with a solution of MeOH/pH 7 phosphate buffer (5 mL/5 mL) and the -78 °C cold bath replaced with an ice bath. After warming to O °C, the biphasic mixture was treated with a mixture of MeOH/ 30% aqueous  $H_2O_2$  (10 mL/10 mL) and the mixture stirred at 0 °C for 1 h. The mixture was warmed to room temperature and diluted with Et<sub>2</sub>O (250 mL). The organic solution was washed with saturated aqueous NaHCO<sub>3</sub> (2 x 150 mL) and brine (150 mL). The aqueous washes were extracted with Et<sub>2</sub>O (75 mL). The combined organic solutions were dried over MgSO<sub>4</sub>, filtered, and concentrated. The residue was purified by flash chromatography (1 kg SiO<sub>2</sub>, Gradient elution:  $15 \rightarrow 30\%$  EtOAc/hexanes) to give 10.25 g (79%) of aldol product mixture and 1.04 g (15%) of starting methyl ketone 26. The diastereoselectivity of the aldol addition process was determined to be 22:1 favoring the 1,5 anti product 28 (Zorbax, 20% EtOAc/hexanes, 1 mL/min). (1S)-1-(2-Napthyl)ethyl(2S,4S,6S,8R,10R)-10-hydroxy-8-(trityloxymethyl)-4-methoxy-1,7-dioxaspiro-

[5.5]undecane-2-acetate (32a). A solution of the diol 32 (0.731 g, 1.64 mmol) in pyridine (8 mL) was treated with trityl chloride (freshly recrystallized from heptane, 2.22 g, 8.19 mmol). The yellow solution was stirred at 60-65 °C for 4 h, cooled to room temperature, and stirred for an additional 12 h. The solution was diluted with water (30 mL) and extracted with EtOAc (2 x 75 mL). The combined organic solutions were washed with brine (50 mL), dried over MgSO<sub>4</sub>, filtered, and concentrated. The residue was purified by flash chromatography (150 g SiO<sub>2</sub>, 50–60% EtOAc/hexanes) to give 0.986 g (89%) of the product 32a as a yellow foam:  $[\alpha]^{25}_{589}$  -20.6 (*c* 1.90, CHCl<sub>3</sub>); IR (neat) v 3518, 3056, 2933, 1728 cm<sup>-1</sup>; <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  7.81-7.74 (m, 3H), 7.66-7.64 (m, 1H), 7.48-7.18 (m, 18H), 6.15 (q, J = 6.6 Hz, 1H), 4.16-4.03 (m, 2H), 3.89-3.86 (d, J = 12.0 Hz, 1H), 3.58-3.43 (m, 1H), 3.33 (s, 3H), 3.05-3.01 (dd, J = 9.4, 4.7 Hz, 1H), 2.96-2.93 (dd, J = 9.4, 4.4 Hz, 1H), 2.12-2.03 (m, 2H), 1.69-1.62 (m, 2H), 1.63 (d, J = 6.6 Hz, 3H), 1.55-1.50 (dd, J = 14.4, 3.7 Hz, 1H), 1.43-1.37 (t, J = 11.5 Hz, 1H), 1.33-1.27 (q, J = 11.8 Hz, 1H); <sup>13</sup>C NMR (101 MHz, CDCl<sub>3</sub>)  $\delta$  170.8, 144.1, 138.2, 132.9, 128.8, 127.6, 127.5, 126.8, 126.1, 126.0, 125.4, 124.0, 99.4, 86.1, 73.1, 72.9, 67.5, 66.4, 64.6, 63.6, 55.5, 42.7, 41.1, 36.5, 34.9, 34.4, 21.7; exact mass calcd for C<sub>44</sub>H<sub>46</sub>O<sub>7</sub>Na: 709.3129; found 709.3110 (FAB, MNBA, added NaI); R<sub>f</sub>=0.50 (90% EtOAc/hexanes).

(1S)-1-(2-Napthyl)ethyl(2S,4S,6S,8R,10R)-10-tert-butyldimethylsiloxy-8-(trityloxymethyl)-4-methoxy-

1,7-dioxaspiro[5.5]undecane-2-acetate (33). To a cold solution (-100 °C) of the spiroketal 32a (0.986 g, 1.42 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (30 mL) was added 2,6-lutidine (0.245 mL, 0.228 g, 2.13 mmol) and tertbutyldimethylsilyl triflate (0.324 mL, 0.394 g, 1.49 mmol). The yellow solution was warmed to -78 °C and stirred 1 h at this temperature. The solution was quenched with saturated aqueous  $NH_4Cl$  (10 mL) and the cold bath removed. After warming to room temperature, the reaction mixture was extracted with  $E_{t_2O}$  (2 x 50 mL). The combined organic extracts were washed with saturated aqueous  $NH_4Cl$  (50 mL) and brine (30 mL). The solution was dried over MgSO<sub>4</sub>, filtered and concentrated. The residue was purified by flash chromatography (100 g SiO<sub>2</sub>, 10% EtOAc/hexanes) to give 1.06 g (93%) of silvl ether 33 as a white foam:  $[\alpha]^{25}_{589}$  -20.2  $(c 1.26, CHCl_3)$ ; IR (neat) v 3056, 2953, 2861, 1733 cm<sup>-1</sup>; <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>)  $\delta$  7.81-7.77 (m, 3H), 7.48-7.43 (m, 6H), 7.27-7.18 (m, 13H), 6.07 (q, J = 6.5 Hz, 1H), 4.55-4.25 (m, 1H), 4.13-4.11 (t, J = 3.4 Hz, 1H), 3.90-3.86 (dt, J = 8.0, 2.1 Hz, 1H), 3.43-3.38 (m, 1H), 3.22 (s, 3H), 3.17-3.04 (m, 2H), 2.83-2.80 (dd, J = 15.5, 3.8 Hz, 1H), 2.58-2.52 (dd, J = 15.5, 9.9 Hz, 1H), 2.19-2.11 (m, 2H), 2.02-1.99 (dd, J = 12.3, 3.1 Hz, 1H), 1.73 (br d, J = 13.4 Hz, 1H), 1.68-1.65 (m, 1H), 1.63-1.62 (d, J = 6.5 Hz, 3H), 1.48-1.44 (dd, J = 14.3, 3.6 Hz, 1H), 1.37-1.32 (t, J = 11.9 Hz, 1H), 1.10 (q, J = 11.6 Hz, 1H), 0.761 (s, 9H), 0.01 (s, 3H), -0.05 (s, 3H); <sup>13</sup>C NMR (101 MHz, CDCl<sub>3</sub>) δ 170.1, 144.1, 138.7, 133.1, 130.0, 128.8, 128.2, 128.0, 127.6, 127.5, 126.8, 126.1, 126.0, 125.3, 124.1, 120.1, 98.2, 86.1, 73.8, 72.5, 66.9, 66.5, 64.9, 64.3, 55.4, 43.2, 41.1, 36.6, 35.6, 35.5, 25.7, 21.9, 17.9, -4.8, -4.9; exact mass calcd for C<sub>50</sub>H<sub>60</sub>O<sub>7</sub>SiNa: 823.4006; found 823.3975 (FAB, MNBA, added NaI); R=0.48 (30% EtOAc/hexanes).

2-[N-methoxy-N-methyl-]-(2S,4S,6S,8R,10R)-10-tert-butyldimethylsiloxy-8-(trityloxymethyl)-4-methoxy-1,7-dioxaspiro[5.5]undecane-2-acetamide (34). To a cooled (-10 °C) solution of the ester 33 (0.699 g, 0.873 mmol) in THF (15 mL) was added N,O-dimethyl hydroxylamine hydrochloride (0.153 g, 1.57 mmol). The resulting suspension was treated with a solution of ethyl magnesium bromide (4.71 mL of a 1M solution in Et<sub>2</sub>O, 4.71 mmol) maintaining an internal temperature of -10 °C to -5 °C during the addition. The pale yellow solution was stirred for 90 min at -10 °C. The solution was quenched with saturated aqueous NH<sub>4</sub>Cl (5 mL). The cold bath was removed and the biphasic mixture stirred for 30 min. The solution was extracted with Et<sub>2</sub>O (2 x 50 mL) and the combined organic solutions washed with saturated aqueous NH<sub>4</sub>Cl (20 mL). The solution was dried over MgSO<sub>4</sub>, filtered, and concentrated. the residue was purified by flash chromatography (60 g SiO<sub>2</sub>, 15% EtOAc/hexanes then 50% EtOAc/hexanes) to give 0.018 g (3%) of ethyl ketone **35** and 0.540 g (90%) of the amide **34**:  $[\alpha]^{25}_{589}$  -5.8 (c 1.26, CH<sub>2</sub>Cl<sub>2</sub>); IR (neat)  $\nu$  3058, 2949, 2872, 1733, 1662 cm<sup>-1</sup>; <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  7.46-7.44 (d, J = 7.2 Hz, 6H), 7.29-7.19 (m, 9H), 4.62-4.50 (m, 1H), 4.16-4.15 (t, J = 3.2 Hz, 1H), 4.02-3.97 (m, 1H), 3.65 (s, 3H), 3.55-3.45 (m, 1H), 3.33 (s, 3H), 3.21-3.10 (m, 5H), 2.87-2.72 (m, 2H), 2.37-2.34 (br d, J = 12 Hz, 1H), 2.24-2.20 (dd, J = 14.1, 2.8 Hz, 1H), 2.06-2.02 (dd, J = 11.7, 4.3 Hz, 1H), 1.85-1.82 (d, J = 13.4 Hz, 1H), 1.73-1.65 (m, 2H), 1.52-1.48 (dd, J = 3.6, 14.4, Hz, 1H), 1.39-1.33 (t, J = 11.9 Hz, 1H), 0.90 (s, 9H), 0.08 (s, 3H), 0.07 (s, 3H); <sup>13</sup>C NMR (101 MHz, CDCl<sub>3</sub>)  $\delta$  172.0, 144.1, 128.8, 127.6, 126.8, 98.3, 86.1, 73.9, 67.2, 66.5, 65.0, 64.3, 61.2, 55.7, 43.4, 38.4, 37.1, 35.8, 35.7, 32.0, 25.8, 18.1, -4.8, -4.9; exact mass calcd for C<sub>40</sub>H<sub>55</sub>O<sub>7</sub>SiNNa: 712.3646; found 712.3656 (FAB, MNBA, added NaI); R<sub>f</sub>=0.35 (40% EtOAc/hexanes).

(25,45,65,8R,10R)-10-tert-butyldimethylsiloxy-2-(buta-3-one)-8-(trityloxymethyl)-4-methoxy-1,7-dioxaspiro[5.5]undecane (35). A cooled solution (0 °C) of the amide 34 (0.896 g, 1.30 mmol) in THF (25 mL) was treated with a solution of ethylmagnesium bromide (6.51 mL of a 1 M solution in Et<sub>2</sub>O, 6.51 mmol). The bright yellow solution was stirred at 0 °C for 90 min. The solution was treated with saturated aqueous NH<sub>4</sub>Cl solution (10 mL) and the cold bath removed. After warming to room temperature, the mixture was extracted with Et<sub>2</sub>O (2 x 60 mL). The combined organic solutions were dried over MgSO<sub>4</sub>, filtered, and concentrated. The residue was purified by flash chromatography (75 g SiO<sub>2</sub>, 15% EtOAc/hexanes) to give 0.785 g (95%) of the ethyl ketone 35 as a white foam:  $[\alpha]^{25}_{589}$  -2.7 (c 2.18, CH<sub>2</sub>Cl<sub>2</sub>); IR (neat) v 3058, 2929, 2850, 1715 cm<sup>-1</sup>; <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  7.46-7.44 (m, 6H), 7.29-7.19 (m, 9H), 4.59-4.55 (m, 1H), 4.15-4.13 (t, J = 3.4 Hz, 1H), 3.97-3.92 (m, 1H), 3.53-3.45 (m, 1H), 3.32 (s, 3H), 3.21-3.17 (dd, J = 8.8, 4.5 Hz, 1H), 3.10-3.06(dd, J = 6.3, 8.8 Hz, 1H), 2.87-2.82 (dd, J = 17.2, 3.6 Hz, 1H), 2.70-2.64 (dd, J = 17.2, 8.9, 1H), 2.45-2.40 (q, J = 17.2, 8.9)J = 7.4 Hz, 2H), 2.24-2.14 (m, 2H), 2.05-2.01 (dd, J = 12.0, 3.6 Hz, 1H), 1.81-1.77 (br d, J = 13.4 Hz, 1H), 1.70-1.63 (m, 2H), 1.36-1.30 (t, J = 12.0, Hz, 1H), 1.06-1.03 (t, J = 7.4 Hz, 3H), 0.88 (s, 9H), 0.07 (s, 3H), 0.034 (s, 3H); <sup>13</sup>C NMR (101 MHz, CDCl<sub>3</sub>) δ 209.3, 144.1, 128.8, 127.6, 126.8, 126.8, 98.2, 86.2, 73.8, 66.6, 65.0, 64.3, 55.5, 48.6, 43.2, 37.0, 36.9, 35.8, 35.7, 25.8, 18.1, 7.7, -4.8; exact mass calcd for C<sub>40</sub>H<sub>54</sub>O<sub>6</sub>SiNa: 681.3587; found 681.3591 (FAB, MNBA, added NaI); Rf=0.41 (30% EtOAc/hexanes).

2'-Methyl-2-[2S,5R]-2-(tert-butyldimethylsiloxy-5-methyl-4-methylene-hexan-6-al)-1,3-dioxolane (36). A solution of di-tert-butylbiphenyl (9.76 g, 36.6 mmol) in THF (120 mL) was treated with several small pieces of cut and crushed (with pliers) lithium wire (0.330 g, 47.6 mmol) at room temperature. The mixture was sonicated (with cooling to maintain temperature 10-25 °C) for 5 h to produce a deep green solution of the radical anion solution. In a separate flask, a solution of benzyl ether 12 (0.720 g, 1.66 mmol) in THF (15 mL) was cooled to -78 °C. The radical anion solution was added portionwise (ca. 20 mL) until the green-blue color persisted. The solution was stirred for 30 min at -78 °C and carefully quenched with saturated aqueous NH₄Cl solution. The cold bath was removed and the mixture warmed to room temperature. The mixture was extracted with Et<sub>2</sub>O (2 x 40 mL). The combined organic solutions were washed with saturated aqueous NH<sub>4</sub>Cl (15 mL) and brine (10 mL). The organic solution was dried over MgSO<sub>4</sub>, filtered, and concentrated. The residue was purified by flash chromatography (50 g SiO<sub>2</sub>, 100% Hexanes then 30 % EtOAc/ hexanes) to give 0.366 g (70%) of the desired alcohol and 0.139 g (27%) of a mixture of the desired product and deketalized product. Data for the alcohol:  $[\alpha]^{23}_{589}$  +22.4 (c 2.8, CHCl<sub>3</sub>) IR (neat) v 3446, 2964, 2861, 1641 cm<sup>-1</sup>; <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ 4.97 (s, 1H), 4.89 (s, 1H), 4.17-4.12 (m, 1H), 3.57-3.38 (m, 6H), 2.50-2.45 (dd, J = 14.1, 5.6 Hz, 1H), 2.36-2.28 (m, 2H), 2.08-1.94 (m, 2H), 1.84 (br s, 1H), 1.32 (s, 3H), 1.05-1.03 (d, J = 6.9Hz, 3H), 0.991 (s, 9H), 0.15 (s, 3H), 0.10 (s, 3H); <sup>13</sup>C NMR (101 MHz, CDCl<sub>3</sub>) δ 148.9, 112.3, 109.3, 68.2, 66.3, 64.4, 64.1, 46.4, 44.9, 42.2, 26.1, 24.8, 18.2, 16.5, -4.0, -4.1; exact mass calcd for C18H37O4Si: 345.2461 [M<sup>+</sup> +1]; found 345.2467 (CI); R<sub>f</sub>=0.26 (25% EtOAc/ hexanes). A solution of Dess-Martin periodinane

(0.105 g, 0.248 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (2 mL) was prepared under an inert atmosphere (weighed in dry-box) and treated with pyridine (0.152 mL, 0.150 g, 1.90 mmol). After stirring for 5 min, a solution of the alcohol (0.066 g, 0.190 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (1 mL) was added. The clear, yellow solution was stirred for 40 min. The solution was quenched with 1M Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>/saturated aqueousNaHCO<sub>3</sub> (0.5 mL/0.5 mL). The mixture was extracted with Et<sub>2</sub>O (2 x 10 mL). The combined organic solutions were washed with saturated aqueous NaHCO<sub>3</sub> (2 x 5 mL) and brine (5 mL). The organic solution was dried over MgSO<sub>4</sub>, filtered, and concentrated. The residue (0.060 g, 92%) was used without further purification Data for aldehyde **36**:  $[\alpha]^{23}_{589}$  +31.67 (*c* 2.67, CHCl<sub>3</sub>) IR (neat)  $\nu$  2959, 2713, 1726, 1638 cm<sup>-1</sup>; <sup>1</sup>H NMR (400 MHz, C<sub>6</sub>D<sub>6</sub>)  $\delta$  9.32 (s, 1H) 5.05 (s, 1H), 4.80 (s, 1H), 4.11-4.05 (m, 1H), 3.59-3.44 (m, 4H), 2.93-2.88 (dq, *J* = 2.3, 6.4 Hz, 1H), 2.52-2.47 (dd, *J* = 14.2, 4.4 Hz, 1H), 2.28-2.22 (dd, *J* = 14.2, 7.2 Hz, 1H), 2.03-1.93 (m, 2H), 1.27 (s, 3H), 1.05-1.03 (d, *J* = 6.4 Hz, 3H), 0.959 (s, 9H), 0.124 (s, 3H), 0.054 (s, 3H); <sup>13</sup>C NMR (101 MHz, C<sub>6</sub>D<sub>6</sub>)  $\delta$  148.9, 112.3, 109.3, 68.2, 66.3, 64.4, 64.1, 46.4, 44.9, 42.2, 26.1, 24.8, 18.2, 16.5, -4.0, -4.1; exact mass calcd for C<sub>18</sub>H<sub>35</sub>O<sub>4</sub>Si: 343.2305; found 343.2300 (CI); R*f*=0.39 (20% EtOAc/ hexanes).

2'-Methyl-2-[2S,5R,6S,7S]-2-(tert-butyldimethylsiloxy-4-methylene-5-methyl-6-hydroxy-7-methyl-non-8one)-1,3-dioxolane (37). A solution of dicyclohexylboron chloride (0.112 mL, 0.112 g, 0.511 mmol) and triethylamine (0.071 mL, 0.052 g, 0.511 mmol) in pentane (11 mL) was cooled to 0 °C and treated with neat 3pentanone (0.052 mL, 0.044 g, 0.511 mmol) producing a granular white precipitate (triethylamine hydrochloride). The mixture was stirred for 1 h at 0 °C and then cooled to -78 °C. A solution of the aldehyde 51 (0.060 g, 0.176 mmol) in pentane (1 mL) was added. The resulting white slurry was stirred at -78 °C for 90 min, quenched with MeOH/ pH 7 buffer (0.5 mL/0.5 mL), warmed to room temperature and treated with  $H_2O_2$ (30% aqueous)/MeOH (0.5 mL/0.5 mL). After stirring for 45 min, the mixture was extracted with  $Et_2O$  (2 x 15 mL). The combined organic extracts were washed with saturated aqueous NaHCO<sub>3</sub> (2 x 10 mL) and brine (5 mL). The organic solution was dried over MgSO<sub>4</sub>, filtered and concentrated. A small portion of the unpurified residue was silvlated with trimethylsilyl imidazole (THF, 12 h, 22 °C) and assayed by gas chromatography. GC assay (DB 1701, oven temperature 190 °C, flow rate 16) showed a 97:3 ratio of isomers. tr (major isomer) = 43.76 min. The residue was purified by flash chromatography (20 g SiO<sub>2</sub>, 15% EtOAc/hexanes) to give 0.070 g (93%) of the aldol adduct 37: [α]<sup>23</sup><sub>589</sub> +29.9 (c 2.85, CHCl<sub>3</sub>) IR (neat) v 3497, 2956, 2898, 1715, 1637 cm<sup>-1</sup>; <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  5.99 (s, 1H), 5.88 (s, 1H), 4.96-4.87 (m, 5H), 4.64-4.60 (dt, J = 8.3, 4.1 Hz, 1H), 3.74-3.66 (quintet, J = 7.2 Hz, 1H), 3.54-3.49 (q, J = 7.2 Hz, 2H), 3.40-3.36 (dd, J = 14.4, 4.2Hz, 1H), 3.31-3.26 (m, 1H), 2.94-2.88 (dd, J = 14.4 Hz, 7.3, 1H), 2.85-2.81 (dd, J = 14.4, 3.9 Hz), 1.30 (s, 3H), 1.03-1.00 (m, 6H), 0.844 (s, 9H), 0.046 (s, 3H), 0.003 (s, 3H); <sup>13</sup>C NMR (101 MHz, CDCl<sub>3</sub>) δ 215.9, 148.4, 113.9, 108.8, 82.9, 73.6, 67.5, 64.3, 64.0, 47.4, 46.0, 44.0, 41.0, 36.5, 30.0, 25.8, 25.6, 24.5, 23.6, 17.9, 13.7, 11.5, 7.3, -4.4; exact mass calcd for  $C_{23}H_{44}O_5SiNa$ : 451.2856; found 451.2852 (FAB, MNBA, added NaI); Rf=0.39 (20% EtOAc/ hexanes).

2-[(2S,4S,6R,8S,10S)-8-[(3R,4S,5S)-7-[(2S,4S,6R,8S,10S)-10-(*tert*-Butyldimethylsiloxy)-4-methoxy-8-(tri-tyloxymethyl)-1,7-dioxaspiro[5.5]undec-2-yl]-4-hydroxy-3,5-dimethyl-2-methylene-6-oxoheptyl]-4-(tri-ethylsiloxy)-10-methyl-10-(triethylsiloxy)-1,7-dioxaspiro[5.5]undec-2-yl]1-(*tert*-butyldimethylsiloxy)-

ethane (39). A solution of the ethyl ketone 35 (0.125 g, 0.202 mmol) in pentane (4.0 mL) was cooled to 0 °C and treated with dicyclohexylboron chloride (0.043 mL, 0.043 g, 0.202 mmol). After stirring for 10 min at 0 °C, triethylamine (0.028 mL, 0.020 g, 0.202 mmol) was added, producing a granular white precipitate. The heterogeneous mixture was stirred at 0 °C for 90 min. The enolate solution was cooled to -78 °C and treated with a solution of the unpurified aldehyde 21 (0.093 g, 0.137 mmol) in pentane (1.0 mL). The mixture was stirred at -78 °C for 4 h, the mixture was quenched with a solution of MeOH/pH 7 phosphate buffer (1 mL/1 mL) and the -78 °C bath replaced with an ice/water bath. Aqueous H<sub>2</sub>O<sub>2</sub>/pH 7 phosphate buffer (1 mL/1 mL) was added, and the mixture was stirred at 0 °C for 1 h. The mixture was extracted with Et<sub>2</sub>O (3 x 15 mL). The combined organic solutions were washed with saturated aqueous NaHCO<sub>3</sub> (2 x 10 mL) and brine (10 mL). The solution was dried over MgSO<sub>4</sub>, filtered, and concentrated. HPLC analysis of the unpurified product mixture showed a 9:1 mixture of aldol diastereomers (Zorbax column, 15 % EtOAc/ hexanes, 1.0 mL/ min; T<sub>R</sub> Minor = 5.50 min, T<sub>R</sub> Major = 7.18 min). The residue was purified by an initial flash

chromatography (20 g SiO<sub>2</sub>, 15% EtOAc / hexanes) to give 0.194 g of a residue which was repurified by preparative HPLC (Zorbax column, 15% EtOAc/ hexanes, 20 mL/min) to give 0.118 g (64 % over two steps) of the major isomer 39, 0.011 g (6 %) of a minor isomer, and unreacted ethyl ketone 35 (52 mg 74 % of theoretical). 2-[(2S,4S,6R,8S,10S)-8-[(3R,4S,5S)-7-[(2S,4S,6R,8S,10S)-10-(tert-Butyldimethylsiloxy)-4-methoxy-8-(formyl)-1,7-dioxaspiro[5.5]undec-2-yl]-4-hydroxy-3,5-dimethyl-2-methylene-6-oxoheptyl]-4-hydroxy-10methyl-10-(triethylsiloxy)-1,7-dioxaspiro[5.5]undec-2-yl]ethylmethoxyacetate,diacetate (42). To a room temperature solution of **41a** (45.8 mg, 0.045 mmol) in 5 mL of CH<sub>2</sub>Cl<sub>2</sub> was added, via cannula, a suspension of Dess-Martin periodinane (75.6 mg, 0.178 mmol) and pyridine (0.083 mL, 1.02 mmol) in 2 mL of CH<sub>2</sub>Cl<sub>2</sub>. The reaction was stirred for 1.6 h, then diluted with saturated aqueous NaHCO<sub>3</sub> (2 mL), saturated aqueous Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> (2 mL), and Et<sub>2</sub>O (2 mL) and stirred for 30 min. The mixture was extracted with Et<sub>2</sub>O (2 x). The combined organic solutions were washed with saturated aqueous NaHCO<sub>3</sub> (1 x) and brine (1 x), dried over MgSO<sub>4</sub>, filtered, and concentrated. Flash chromatography (2 x 12 cm silica gel, linear gradient, 20-30% acetone/hexanes) provided 41.6 mg (90%) of a clear oil.  $[\alpha]^{23}_{589}$  -11.1 (c 0.98, CH<sub>2</sub>Cl<sub>2</sub>); IR (neat) 2955, 2931,  $1737 \text{ cm}^{-1}$ ; <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  9.72 (s, 1H), 5.24-5.21 (dd, J = 9.5, 2.3 Hz, 1H), 5.02 (br s, 1H), 4.99 (s, 1H), 4.84 (s, 1H), 4.84-4.80 (m, 1H), 4.28-4.23 (m, 2H), 4.16 (m, 1H), 4.01 (s, 2H), 4.03-3.92 (m, 3H), 3.50-3.43 (m, 1H), 3.44 (s, 3H), 3.31 (s, 3H), 2.93-2.87 (m, 2H), 2.78-2.71 (dd, J = 18.2, 9.6 Hz, 1H), 2.40-2.38 (m, 1H), 2.34-2.14 (m, 4H), 2.11-2.07 (dd, J = 12.0, 4.2 Hz, 1H), 2.03 (s, 3H), 1.91 (s, 3H), 1.86-2.14 (m, 2H), 2.11-2.07 (dd, J = 12.0, 4.2 Hz, 1H), 2.03 (s, 3H), 1.91 (s, 3H), 1.86-2.14 (m, 2H), 2.11-2.07 (dd, J = 12.0, 4.2 Hz, 1H), 2.03 (s, 3H), 1.91 (s, 3H), 1.86-2.14 (m, 2H), 2.11-2.07 (dd, J = 12.0, 4.2 Hz, 1H), 2.03 (s, 3H), 1.91 (s, 3H), 1.86-2.14 (m, 2H), 2.11-2.07 (dd, J = 12.0, 4.2 Hz, 1H), 2.03 (s, 3H), 1.91 (s, 3H), 1.86-2.14 (m, 2H), 2.11-2.07 (dd, J = 12.0, 4.2 Hz, 1H), 2.03 (s, 3H), 1.91 (s, 3H), 1.86-2.14 (m, 2H), 2.11-2.07 (dd, J = 12.0, 4.2 Hz, 1H), 2.03 (s, 3H), 1.91 (s, 3H), 1.86-2.14 (m, 2H), 2.11-2.07 (dd, J = 12.0, 4.2 Hz, 1H), 2.03 (s, 3H), 1.91 (s, 3H), 1.86-2.14 (m, 2H), 2.11-2.07 (dd, J = 12.0, 4.2 Hz, 1H), 2.03 (s, 3H), 1.91 (s, 3H), 1.86-2.14 (m, 2H), 2.11-2.14 (m, 2H), 2.14 (m, 2H) 1.36 (m, 15 H), 1.20 (s, 3H), 1.08-1.07 (d, J = 6.8 Hz, 3H), 1.05-1.04 (d, J = 7.0 Hz, 3H), 0.94-0.90 (t, J = 8.0Hz, 9H), 0. 85 (s, 9H), 0.57-0.51 (q, J = 8.0 Hz, 6H), 0.05 (s, 3H), 0.02 (s, 3H); <sup>13</sup>C NMR (100.6 MHz, CDCl<sub>3</sub>) § 209.6, 202.7, 171.0, 170.2, 169.4, 147.0, 113.7, 98.6, 96.9, 74.1, 73.5, 71.1, 70.6, 69.8, 67.1, 66.6, 64.5, 63.6, 62.0, 61.3, 59.4, 55.7, 49.5, 47.8, 47.7, 45.2, 43.3, 41.8, 38.64, 38.60, 36.9, 35.2, 34.3, 34.1, 33.2, 32.1, 25.9, 21.6, 20.8, 18.2, 13.5, 12.0, 7.3, 6.9, -4.9; Mass calcd. for C<sub>52</sub>H<sub>90</sub>O<sub>16</sub>Si<sub>2</sub>Na: 1049; found: 1049 (FAB, m-nitrobenzyl alcohol, NaI added).

(2S,4S,6S8R,10R)-10-tert-butyldimethylsiloxy-8-(hydroxymethyl)-4-methoxy--2-(buta-3-one)-1,7-dioxaspiro[5.5]undecane (43). A solution of trityl ether 35 (0.045 g, 0.073 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (5 mL) was cooled to -78 °C and treated with a solution of Me<sub>2</sub>AlCl (0.364 mL of a 1 M solution in hexanes, 0.364 mmol). The resulting bright yellow solution was stirred at -78 °C for 40 min. The solution was quenched at -78 °C with saturated aqueous Rochelle's salt/THF (0.200 mL/ 0.600 mL), resulting in rapid decolorization. The cold bath was removed and additional portions of Rochelle's salt (3 mL) and Et<sub>2</sub>O (3 mL) were added. The biphasic mixture was stirred for 4 hrs. The mixture was extracted with  $Et_2O$  (2 x 5 mL) and the combined organic solutions treated again with saturated aqueous Rochelle's salt (2 mL). The mixture was stirred for 1 h. The mixture was extracted with Et<sub>2</sub>O (2 x 5 mL). The combined organic solutions were washed with 1M HCl (2 x 5 mL), water (5 mL), and brine (5 ML). The organic solution was dried over MgSO<sub>4</sub>, filtered, and concentrated. The residue was purified by flash chromatography (5 g SiO<sub>2</sub>, 70% EtOAc/hexanes) to give 0.025 g (83%) of carbinol 43 as a clear, colorless oil:  $[\alpha]^{25}_{589}$  -23.6 (c 1.26, CHCl<sub>3</sub>); IR (neat) v 3466, 2943, 2892, 1712 cm<sup>-1</sup>; <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>)  $\delta$  4.43-4.40 (m, 1H), 4.11-4.08 (t, J = 3.7 Hz, 1H), 3.94-3.90 (m, 1H), 3.68-3.65 (dd, J = 11.6, 3.15 Hz, 1H), 3.51-3.44 (m, 2H) 3.31 (s, 3H), 2.84-2.79 (dd, J = 17.1, 3.7 Hz, 1H), 2.65-2.61 (dd, J = 14.6, 3.8), 2.42-2.38 (q, J = 7.3 Hz, 2H), 2.02-1.99 (ddd, J = 12.2, 4.4, 1.5 Hz, 1H), 1.69-1.63 (m, 2H), 1.49-1.46 (m, 2H), 1.35-1.30 (t, J = 11.9 Hz, 1H), 1.04-1.02 (t, J = 7.4 Hz, 3H), 0.84 (s, 9H), 0.02 (s, 3H), 0.01 (s, 3H); <sup>13</sup>C NMR (101 MHz, CDCl<sub>3</sub>) δ 209.1, 98.2, 73.8, 66.6, 66.3, 65.8, 64.2, 55.5, 48.5, 43.1, 39.8, 37.0, 36.8, 35.7, 34.2, 25.8, 18.0, 7.6, -4.9; exact mass calcd for  $C_{21}H_{40}O_6Na$ : 439.2492; found 439.2476 (FAB, MNBA, added NaI); Rf=0.15 (60% EtOAc/hexanes).

(2S,4S,6R8R,10R)-10-tert-Butyldimethylsiloxy-8-(hydroxymethyl)-4-methoxy-2-(buta-3-one)-1,7-dioxaspiro[5.5]undecane (44). A solution of trityl ether 35 (0.010 g, 0.016 mmol) in EtOH (1.0 mL) and pyridine (0.013 mL, 0.013 g, 0.160 mmol) was treated with anhydrous  $SnCl_2$  (0.031 g, 0.160 mmol). The heterogeneous mixture was heated to reflux for 24 h. The yellow mixture was cooled to room temperature, diluted with EtOAc (5 mL) and washed with saturated aqueous NH<sub>4</sub>Cl (2 mL) and brine (2 mL). The organic solution was dried over MgSO<sub>4</sub>, filtered, and concentrated. The residue was purified by flash chromatography (10 g  $SiO_2$ , 40% EtOAc/hexanes) to give 0.004 g (51%) of carbinol 44 as a clear, colorless oil: [ $\alpha$ ]<sup>25</sup><sub>589</sub> +26.9 (c 0.58, CHCl<sub>3</sub>); IR (neat) v 3464, 2928, 2856, 1715 cm<sup>-1</sup>; <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>)  $\delta$  4.44-4.41 (m, 1H), 4.16-4.13 (m, 1H), 4.05-4.04 (m, 1H), 3.63-3.55 (m, 3H), 3.31 (s, 3H), 2.74-2.68 (dd, J = 15.7, 7.4 Hz, 1H), 2.66-2.61 (m, 1H), 2.49-2.41 (m, 3H), 2.08-2.04 (m, 1H), 1.81-1.77 (dd, J = 13.4, 4.1 Hz), 1.72-1.60 (m, 2H), 1.50-1.46 (m, 1H), 1.15-1.04 (m, 2H), 1.06-1.02 (t, J = 7.3 Hz, 3H), 0.88 (s, 9H), 0.041 (s, 3H), 0.036 (s, 3H); <sup>13</sup>C NMR (101 MHz, CDCl<sub>3</sub>)  $\delta$  210.2, 99.6, 72.5, 71.3, 65.9, 65.8, 63.5, 55.4, 48.4, 44.0, 39.8, 37.4, 37.2, 34.6, 25.7, 18.0, 7.5, -4.8, -4.9; exact mass calcd for C<sub>21</sub>H<sub>40</sub>O<sub>6</sub>Na: 439.2492; found 439.2489 (FAB, MNBA, added NaI); R = 0.20 (60% EtOAc/hexanes).

(2S, 3R)-N-Methoxy-N,2-dimethyl-3-(triethylsiloxy)-6-heptenamide (45a). To a solution of ca. 27 g (134 mmol) alcohol 45 in 500 mL of CH<sub>2</sub>Cl<sub>2</sub> at -78°C, was added 25 mL (218 mmol) of 2,6-lutidine followed by 39.3 mL (174 mmol) of triethylsilyl trifluoromethanesulfonate. The reaction was allowed to warm to -20 °C over 1 h and cooled to -78 °C. The solution was poured into a mixture of Et<sub>2</sub>O and saturated aqueous NaHCO<sub>3</sub> (500 mL/100 mL). The aqueous solution was separated and extracted with 200 mL of Et<sub>2</sub>O, and the organic solutions were washed with 3 x 200 mL of 1M NaHSO4. The combined aqueous washes were extracted with 200 mL of Et<sub>2</sub>O. The combined organic solutions were washed with saturated aqueous NaHCO<sub>3</sub> and brine, then dried over Na<sub>2</sub>SO<sub>4</sub>. The volatiles were removed under reduced pressure and the residue was filtered through a short plug of silica gel (15% EtOAc in hexanes) and used directly in the next reaction. The product could be purified by flash chromatography on silica gel (15% EtOAc in hexanes) to give amide 45a.  $[\alpha]^{23}_{D}$  +3.9 (c 2.0, CHCl<sub>3</sub>); IR (neat) v 3077, 2955, 2912, 2877, 1664 cm<sup>-1</sup>; <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$ 5.81-5.71 (m, 1H), 4.99-4.87 (m, 2H), 3.91 (dt, J = 8, 5 Hz, 1H), 3.65 (s, 3H), 3.14 (s, 3H), 2.95 (s(br), 1H), 2.11-2.05 (m, 2H), 1.59-1.45 (m, 2H), 1.14 (d, J = 7 Hz, 3H), 0.94 (t, J = 8 Hz, 9H). 0.60 (q, J = 8 Hz, 6H); <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>) δ 176.3, 138.5, 114.1, 73.3, 61.2, 40.8, 35.0, 31.9, 28.7, 14.4, 6.8, 5.0. (4S, 5R, 6R)-6-(4-hydroxy-butyl)-5-methyl-4-(tert-Butyldimethylsiloxy)-2-methoxy-tetrahydro-2H-pyran (50). To a 0 °C solution of 11.0 g (35.0 mmol) of olefin 49 in 250 mL of THF was added, via cannula, 17.3 g (69.9 mmol) of 9-BBN in 200 mL of THF over 30 min. After 1 h the ice bath was removed, and the clear solution was stirred at room temperature for 1 h, then cooled to 0 °C. The reaction was stopped by adding 70 mL of a 1:1 mixture of THF:EtOH followed by 70 mL of pH 7 buffer and 70 mL of 30%  $H_2O_2$  (T < 10 °C). The ice bath was removed, and the resulting clear solution was stirred at room temperature for 5 h. The reaction was poured into a mixture of 1 L of Et<sub>2</sub>O and 300 mL of water. The organic solution was separated and washed with 200 mL of 5% aqueous Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>. The combined aqueous solutions were extracted with EtOAc (2 x 200 mL), and the combined organic solutions were washed with 200 mL of saturated aqueous NaHCO3 and 200 mL of brine, then dried over MgSO4. The volatiles were removed under reduced pressure, and the residue was purified by flash chromatography (25-30% EtOAc in  $CH_2Cl_2$ ) to afford 9.1 g (85%) of alcohol **50** as a colorless oil. IR (neat) v 3418, 2934, 2884, 2858 cm<sup>-1</sup>; <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ 4.63-4.59 (m, 1H), 4.16-4.11 (m, 1H), 3.90-3.87 (m, 1H<sub>min</sub>), 3.69-3.64 (m, 3H<sub>mai</sub>), 3.49 (s, 3H<sub>min</sub>), 3.32 (s, 3H<sub>mai</sub>),  $1.90 (dt, J = 14, 4 Hz, 1H_{maj}), 1.66-1.28 (m, 9H), 0.89-0.87 (m, 12H), 0.05 (s, 3H_{min}), 0.04 (s, 3H_{maj}), 0.03 (s, 3$ 3H<sub>min</sub>), 0.01 (s, 3H<sub>maj</sub>); <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>) δ 100.3, 97.8, 72.3, 72.0, 69.9, 66.8, 62.7, 56.1, 54.8, 39.3, 38.6, 34.7, 33.7, 32.6, 31.9, 31.0, 25.6, 22.3, 22.2, 17.9, 10.9, 10.7, -4.7, -5.0; Rf 0.3 (30 % EtOAc/CH<sub>2</sub>Cl<sub>2</sub>); exact mass calcd for  $C_{17}H_{36}SiO_4$ +NH<sub>4</sub>: 350.2727; found: 350.2730 (CI, NH<sub>3</sub> atmosphere). (4S, 5R, 6R)-6-(4-benzyloxybutyl)-5-methyl-4-(tert-Butyldimethylsiloxy)-2-phenylthio-tetrahydro-2Hpyran (50a). To a solution of 6.00 g (18.04 mmol) of methyl ketal 50 in 90 mL of 1,2-dichloroethane was added, at room temperature, 10.25 mL (54.13 mmol) of TMSSPh followed by 11.5 g (36.08 mmol) of ZnI<sub>2</sub> in one portion. The slightly exothermic reaction was placed in an ice bath for 10 min and then stirred at room temperature for 1 h. The white heterogeneous mixture was poured into a mixture of EtOAc/saturated aqueous NaHCO<sub>3</sub> (1L/500 mL). The aqueous solution was separated extracted with 2 x 150 mL of EtOAc and the combined organic solutions were washed with 1N HCl (2 x 200 mL), 200 mL of saturated aqueous NaHCO<sub>1</sub>, 200 mL of brine and dried over MgSO<sub>4</sub>. The volatiles were removed under reduced pressure and the residue was purified by flash chromatography (20-30% EtOAc/hexanes) to afford 7.02 g (95%) of the primary alcohol as a colorless oil. To a solution of 6.8 g (16.55 mmol) of the alcohol in 160 mL of DMF at -20°C was added 730 mg (18.21 mmol) of NaH (60% in oil) immediately followed by 2.0 mL (16.55 mmol) of benzyl bromide and 6.1 g (16.55 mmol) of Bu<sub>4</sub>NI. The reaction was allowed to warm to 0 °C where an extra 264 mg (0.4 eq.) of NaH and 0.393 mL (0.2 equiv.) of benzyl bromide were added. The heterogeneous mixture was stirred 4 h at 0 °C, 13 h at 10 °C, and 4 h at room temperature, then diluted at 0 °C with 150 mL of Et<sub>2</sub>O and guenched with 5 mL of saturated aqueous NaHCO<sub>3</sub>. The resulting solution was poured into an Et<sub>2</sub>O/saturated aqueous NaHCO<sub>3</sub> mixture (1 L/200 mL). The organic solution was separated and washed with water (4 x 200 mL), and the combined aqueous solutions were extracted with  $Et_2O$  (2 x 200 mL). The combined organic solutions were washed with 200 mL of brine and dried over MgSO<sub>4</sub>. The volatiles were removed under reduced pressure and the residue was purified by flash chromatography (5-8% EtOAc in hexanes) to afford 7.42 g (90%) of the benzyl ether 50a as a colorless oil.  $\beta$ -Anomer (Major):  $[\alpha]^{23}$  -3.4 (c 1.77, CHCl<sub>3</sub>); IR (neat)  $\nu$ 3062, 3030, 2952, 2931, 2857 cm<sup>-1</sup>; <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>)  $\delta$  7.48-7.16 (m, 10H), 5.18 (dd, J = 12, 2 Hz, 1H), 4.49 (s, 2H), 3.97-3.94 (m, 1H), 3.86-3.85 (m, 1H), 3.47-3.44 (m, 2H), 1.94-1.88 (m, 1H), 1.69-1.29 (m, 8H), 0.89 (d, J = 7 Hz, 3H), 0.88 (s, 9H), 0.03 (s, 6H); <sup>13</sup>C NMR (125 MHz, CDCl<sub>3</sub>)  $\delta$  138.5, 135.1, 130.1, 128.5, 128.2, 127.5, 127.3, 126.4, 80.3, 75.0, 72.8, 71.4, 70.2, 38.3, 34.5, 32.2, 29.5, 25.7, 22.6, 17.9, 10.7, -5.0, -5.1; Rf 0.25 (5 % EtOAc/hexanes); exact mass calcd for C<sub>29</sub>H<sub>44</sub>SiSO<sub>3</sub>+Na: 523.2678; found: 523.2687 (FAB, MNBA NaI added).

(4S, 5R, 6R)-6-(4-benzyloxybutyl)-5-methyl-4-(*tert*-Butyldimethylsiloxy)-2-phenylsulfone-tetrahydro-2H-pyran (51). To a solution of 5.4 g (10.78 mmol) of thioglycoside 50a in 100 mL of ethyl acetate at 0 °C was added 4.53 g (53.9 mmol) of NaHCO<sub>3</sub> followed by 6.29 g (23.72 mmol) of m-CPBA (65 % pure). The reaction was stirred for 2 h at 0 °C, then diluted with 100 mL of Et<sub>2</sub>O and quenched with 10 mL of saturated aqueous NaHCO3. The resulting heterogeneous mixture was poured into an Et2O/saturated aqueous NaHCO3 mixture (600 mL/100 mL). The organic solution was separated and washed with 100 mL of 5% aqueous Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> and 2 x 100 mL of 1N NaOH. The combined aqueous solutions were extracted with 100 mL of Et<sub>2</sub>O, and the combined organic solutions were washed with brine and dried over MgSO<sub>4</sub>. The volatiles were removed under reduced pressure and the residue was purified by flash chromatography (15% EtOAc in hexanes) to afford 5.54 g (97%) of the sulfone 51 as a mixture of anomers.  $\beta$ -Anomer (Major). Ethyl (4S, 2R, 3R)-6-ethylthio-2-triethylsiloxy-3-methyl-4-hydroxy-6-oxohexanoate (59). To a solution of 57 (1.96 g, 5.14 mmol) in 52 mL of acetone was added 5.8 mL (36.0 mmol) of triethylsilane. The reaction was stirred for 5 min, and 0.547 g (0.514 mmol) of Pd/C was added in two portions. After stirring for 35 min, the reaction was filtered through a pad of celite, which was then rinsed several times with fresh Et<sub>2</sub>O, and the volatiles were removed in vacuo. Flash chromatography (3% EtOAc/hexanes, then 6% EtOAc/hexanes) afforded ca. 1.40 g of aldehyde 58, which was used directly in the next step. IR (neat) 2957, 2878, 1753, 1733 cm<sup>-1</sup>; <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  9.73 (d, J = 1.1 Hz, 1H), 4.45 (d, J = 4.8 Hz, 1H), 4.22 (dq, J = 3.6, 8.0 Hz, 1H), 4.20 (dq, J = 3.6, 8.0 Hz, 1H), 2.76 (ddq, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (d, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (d, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (d, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (d, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (d, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (d, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 8.0 Hz, 3H), 1.13 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 1.1, 4.8, 7.1 Hz, 1H), 1.28 (t, J = 1.1, 4.8, 7.1= 7.1 Hz, 3H), 0.95 (t, J = 8.0 Hz, 9H), 0.63 (q, J = 8.0 Hz, 6H); <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>)  $\delta$  202.0, 171.9, 73.1, 61.3, 50.5, 14.1, 10.0, 6.6, 4.5; R<sub>1</sub> 0.33 (10% EtOAc/hexanes); exact mass calcd. for C<sub>13</sub>H<sub>30</sub>O<sub>4</sub>SiN: 292.1944; found: 292.1945 (FAB, m-nitrobenzyl alcohol, NaI added). To a solution of 1.40 g of unpurified aldehyde 58 in 52 mL of toluene at -93 °C was added dropwise 1.70 mL (7.71 mmol) of silyl thioketene acetal 47. The reaction was stirred for 5 min, and 0.76 mL (6.17 mmol) of BF<sub>3</sub>•OEt<sub>2</sub> was added dropwise over 15 min. After stirring a further 15 min, the reaction was quenched by adding 2 mL of triethylamine and diluted with saturated aqueous NaHCO<sub>3</sub>, followed by EtOAc at -93 °C. The aqueous solution was separated and washed with EtOAc (2 x). The combined organic solutions were washed with brine, dried over  $Na_2SO_4$ , filtered and concentrated. <sup>1</sup>H NMR analysis of the unpurified reaction mixture showed an 86:14 mixture of diastereomers. Flash chromatograpy (12% Et<sub>2</sub>O/pentane, then 15% Et<sub>2</sub>O/pentane) afforded 1.38 g (3.65 mmol, 71% from **57**) of the Felkin diasteromer **59** as a yellow oil.  $[\alpha]^{23}_{D}+13.9$  (c 1.16, CH<sub>2</sub>Cl<sub>2</sub>); IR (neat) 3516, 2957, 2937, 2914, 2878, 1750, 1735, 1687 cm<sup>-1</sup>; <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  4.36 (dddd, J = 1.5, 3.1, 4.6, 8.6 Hz, 1H), 4.24-4.16 (m, 3H), 2.88 (q, J = 7.6 Hz, 2H), 2.78 (dd, J = 8.7, 15.0 Hz, 1H), 2.54 (dd, J = 4.6, 15.0 Hz, 1H), 1.96 (ddq, J = 3.1, 3.2, 7.1 Hz, 1H), 1.29 (t, J = 7.6 Hz, 3H), 1.23 (t, J = 7.6 Hz, 3H), 1.02 (d, J = 7.1 Hz, 3H), 0.95 (t, J = 8.0 Hz, 9H), 0.63 (q, J = 8.0 Hz, 6H); <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>)  $\delta$  198.1, 172.7, 76.6, 68.3, 61.1, 48.8, 40.5, 23.4, 14.6, 14.2, 10.0, 6.6, 4.4; R<sub>1</sub> 0.24 (15% Et<sub>2</sub>O/pentane); Anal. Methyl (4S, 2R, 3R)-4-triethylsiloxy-6-methoxy-3-methyltetrahydro-2H-pyran-2-carboxylate (60). To a solution of 59 (1.29 g, 3.41 mmol) in 38 mL of acetone was added triethylsilane (4.1 mL, 25.5 mmol). After stirring for 5 min, 0.365 g of 10% Pd/C was added in one portion. The reaction was stirred for 3 h, then filtered through a pad of celite and concentrated. The residual oil was dissolved in 50 mL of MeOH and 50 mL of CH<sub>2</sub>Cl<sub>2</sub>, and 0.20 g of camphorsulfonic acid was added. After 30 min of stirring, a further 3.0 g of camphorsulfonic acid was added, and the reaction was stirred for 7 days, when <sup>1</sup>H NMR of an aliquot confirmed complete transesterification. The reaction was then diluted with EtOAc, and quenched by adding saturated NaHCO<sub>3</sub>. The aqueous solution was separated and extracted with EtOAc (3 x). The combined organic solutions were washed with brine, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and concentrated. Filtration through a silica plug (15% EtOAc/hexanes, then 70% EtOAc/hexanes) yielded 0.87 g (4.26 mmol) of a volatile, yellow oil contaminated with residual solvent. The oil was dissolved in 21 mL of CH<sub>2</sub>Cl<sub>2</sub>, and 1.16 g (17.0 mmol) of imidazole was added. The solution was then cooled to 0 °C, and 1.1 mL (6.40 mmol) of chlorotriethylsilane was added dropwise. After 5 min, the reaction was quenched by adding pH 7 buffer and diluted with Et<sub>2</sub>O. The aqueous solution was separated and extracted with  $Et_2O(2 x)$ . The combined organic solutions were washed with brine, dried over Na2SO4, filtered, and concentrated. Flash chromatography (8% EtOAc/hexanes) afforded 0.760 g (2.39 mmol, 70% from 59) of a clear oil.  $[\alpha]^{23}$  –45.7 (c 0.470, CH<sub>2</sub>Cl<sub>2</sub>); IR (neat) 2956, 2913, 2877, 1755 cm<sup>-1</sup>; <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  4.90 (dd, J = 1.7, 3.4 Hz, 1H), 3.97 (d, J = 10.4, 1H), 3.77 (s, 3H), 3.69 (ddd, J = 4.7, 4.7, 9.8 Hz, 1H), 3.33 (s, 3H), 1.96 (ddd, J = 3.7, 4.6, 8.4 Hz, 1H), 1.80-1.68(m, 2H), 0.95 (t, J = 8.0 Hz, 9H). 0.58 (q, J = 8.0 Hz, 6H); <sup>13</sup>C (100 MHz, CDCl<sub>3</sub>)  $\delta$  170.9, 99.6, 73.9, 69.1, 55.1, 52.1, 41.1, 39.2, 12.9, 6.8, 5.0; P<sub>1</sub>0.33 (10% EtOAc/hexanes); Anal. (4S, 2R, 3R)-4-Hydroxy-3-methyl(3,4-dihydro-2H-pyran-2-yl) benzotriazolyl ketone (64e). To a solution of potassium trimethylsilanoate (63.6 mg, 0.494 mmol) in 0.70 mL of THF was added 62 (70.6 mg, 0.247 mmol) in 1.0 mL of THF via cannula (0.7 mL THF rinse). The reaction was stirred for 60 min, then quenched by adding pH 5.5 buffer and diluted with EtOAc. The aqueous solution was separated and extracted with EtOAc (2 x). The aqueous solution was then acidified to pH 4.5 with 1 N HCl and extracted with  $CH_2Cl_2$  (3 x). The combined organic solutions were stirred over MgSO4 for 5 min, then filtered and concentrated to afford 72.8 mg of a carboxylic acid. <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  8.02 (br. s, 1H), 6.42 (d, J = 6.2 Hz, 1H), 4.84 (ddd, J = 1.1, 5.0, 6.2 Hz, 1H), 4.37 (d, J = 3.8 Hz, 1H), 3.76 (dd, J = 3.5, 5.0 Hz, 1H), 2.43 (dddq, J = 3.5, 5.0 Hz, 1H), 2.43 (ddq, J = 3.5, 5.0 Hz, 2H), 2H (Hz, 2H), 2H (Hz, 2H), 2H, 2H), 2H (Hz, 2H), 2H 1.1, 3.5, 3.8, 5.8 Hz), 0.95 (d, J = 5.8 Hz, 3H), 0.93 (t, J = 7.8 Hz, 9H), 0.56 (q, J = 7.8 Hz, 9H). The unpurified acid was dissolved in 2.7 mL of CH<sub>2</sub>Cl<sub>2</sub>, and 71 µL (0.535 mmol) of 1-chloro-N,N-2-trimethylpropenylamine was added via syringe. After stirring for 60 min, this was cannulated into a solution of 134 mg (1.12 mmol) benzatriazole, 165 µL (1.66 mmol) pyridine, and ca. 20 mg DMAP in 1 mL CH<sub>2</sub>Cl<sub>2</sub>. The reaction was stirred at room temperature for 3 h, then quenched by adding saturated aqueous NaHCO<sub>3</sub> and diluted with  $Et_2O$ . The aqueous solution was separated and washed with fresh  $Et_2O$  (2x). The combined organic solutions were washed with brine, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and concentrated. The residue was filtered through a short silica plug (CH<sub>2</sub>Cl<sub>2</sub> eluent) to yield 80.0 mg of amide 64e.  $[\alpha]^{23}D$  -39.1 (c 3.25, CHCl<sub>3</sub>); IR (neat) v 2956, 2911, 2877, 1755, 1646 cm<sup>-1</sup>; <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  8.27 (d, J = 8 Hz, 1H), 8.10 (d, 1H), 7.65-7.61 (m, 1H), 7.51-7.47 (m, 1H), 6.65 (d, J = 6 Hz, 1H), 5.64 (d, J = 2 Hz, 1H), 4.91 (td, J = 6, 2 Hz, 1H), 3.70, dd, J = 5, 2 Hz, 1H), 3.04-2.98 (m, 1H), 1.20 (d, J = 7 Hz, 3H), 0.56 (t, J = 8 Hz, 9H), 0.16 (q, J = 8 Hz, 6H); <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>)  $\delta$  168.4, 145.4, 143.5, 131.1, 130.1, 126.0, 119.8, 114.4, 101.9, 64.2, 39.0, 15.9, 6.2, 4.3; Rf 0.3 (5 % EtOAc/hexanes); R<sub>1</sub> 0.80 (CH<sub>2</sub>Cl<sub>2</sub>); exact mass calcd for C<sub>19</sub>H<sub>27</sub>SiN<sub>3</sub>O<sub>3</sub>+NH<sub>4</sub>: 391.2165; found: 391.2164 (CI, NH<sub>3</sub> atmosphere).

(2R, 3S, 4S)-4-(*tert*-Butyldimethylsiloxy)-6-[(2R, 3S, 4S)-3,4-dihydro-3-methyl-4-(triethylsiloxy)-2Hpyran-2-(oxo)methyl] tetrahydro-6-phenylsulfone-3-methyl-2-(4-benzyloxybutyl)-2H-pyran (65). To a solution of 51 (145 mg, 0.272 mmol) in 1.8 mL of THF at -78 °C was added 0.50 mL of freshly prepared LDA (1 mL THF, 140 µL (1.0 mmol) diisopropylamine, 0.68 mL BuLi (1.50 M in hexanes), 0 °C, 10 min). The solution gradually turned bright yellow, and was stirred at -78 °C for 1 h. Amide 64e was then added via cannula in 0.6 mL of THF (0.4 mL THF rinse). The reaction was stirred for a further 30 min at -78 °C, then quenched by adding saturated NH<sub>4</sub>Cl, diluted with Et<sub>2</sub>O and warmed to room temperature. The organic solutions were separated washed with 1 N NaOH. The combined aqueous solutions were washed with Et<sub>2</sub>O (2x). The combined organic solutions were washed with brine, dried over MgSO<sub>4</sub>, filtered and concentrated. <sup>1</sup>H NMR analysis of the unpurified residue indicated a 1.3:1 mixture of sulfone anomers. Flash chromatography (10% EtOAc/hexanes) afforded 104.2 mg (0.132 mmol, 55%) of 65 as a viscous oil.  $\beta$ -Sulfone-anomer (**Major**).  $[\alpha]^{23}_{D}$  +58.1 (c 2.18, CHCl<sub>3</sub>); IR (neat) v 2953, 2877, 1737, 1648 cm<sup>-1</sup>; <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  7.80-7.78 (m, 2H), 7.58-7.27 (m, 8H), 6.27 (d, J = 6 Hz, 1H), 5.33-5.31 (m, 1H), 4.60 (t, J = 6 Hz, 1H), 5.33-5.31 (m, 2H), 4.60 (t, J = 6 Hz, 1H), 5.33-5.31 (m, 2H), 4.60 (t, J = 6 Hz, 1H), 5.33-5.31 (m, 2H), 5.33-5.33 (m, 2H), 5.33-5.33 (m, 2H), 5.33-5.33 (m, 2H), 5.33-5.33 1H), 4.56 (s, 2H), 4.06 (d, J = 2 Hz, 1H), 3.84 (q, J = 3 Hz, 1H), 3.59-3.55 (m, 3H), 2.73 (dd, J = 16, 3 Hz, 1H), 2.49-2.44 (m, 1H), 2.24 (dd, J = 16, 4 Hz, 1H), 1.83-1.40 (m, 7H), 0.97 (s, 9H), 0.93 (d, J = 7 Hz, 3H), 0.90 (t, J = 8 Hz, 9H), 0.85 (d, J = 7 Hz, 3H), 0.59-0.47 (m, 6H), 0.17 (s, 3H), 0.11 (s, 3H); <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>) δ 201.0, 143.7, 138.5, 137.2, 133.4, 130.7, 128.5, 128.2, 127.5, 127.4, 100.1, 99.8, 78.6, 72.8, 72.1, 70.2, 68.8, 64.5, 37.8, 37.4, 32.5, 29.7, 28.8, 25.7, 22.5, 18.1, 17.0, 11.0, 6.6, 4.8, -4.9, -5.2; Rf 0.4 (15 % EtOAc/hexanes); exact mass calcd for  $C_{42}H_{66}Si_2SO_8$ +Na: 809.3915; found: 809.3890 (FAB, MNBA, added NaI). α-Sulfone-anomer (Minor). (2R, 3S, 4S, 6R)-4-(tert-Butyldimethylsiloxy)-6-[(2R, 3S, 4S)-3,4-dihydro-3-methyl-4-(triethylsiloxy)-2Hpyran-2-(oxo)methyl] tetrahydro-6-methoxy-3-methyl-2-(4-benzyloxybutyl)-2H-pyran ( $\alpha$ -66). To a solution of 3.0 g (3.81 mmol) of sulfone 65 (1:1 mixture of anomers) in 150 mL of acetonitrile at room temperature was added 1.5 g of NaHCO<sub>3</sub> and 1.5 g of Na<sub>2</sub>SO<sub>3</sub> followed by 40 mL of a solution of  $ZnI_2$  (51 g; 160 mmol) in MeOH. The mixture was stirred at room temperature for 3 h 30 min, then poured into an Et<sub>2</sub>O/H<sub>2</sub>O mixture (1.5 L/200 mL), and 20 mL of 1 N HCl were added to dissolve the ZnI2. The organic solution was washed with 200 mL of 0.1 N HCl and 3 x 200 mL of  $H_2O$ . The combined aqueous solutions were extracted with Et<sub>2</sub>O (2 x 200 mL), and the combined organic solutions were washed with saturated aqueous NaHCO<sub>3</sub>, brine and dried over MgSO<sub>4</sub>, filtered, and concentrated. The residue was purified by flash chromatography (Gradient 5% to 15% EtOAc in hexanes) to afford 1.18 g of an inseparable mixture of methyl ketal  $\alpha$ -66 and 237 mg of elimination product. The  $\alpha$ -sulfone-anomer was found to be inert to these methanolysis conditions. 1.16 g were recovered unchanged and treated with a MeOH solution of MgBr2•Et2O (20 g, 77.4 mmol in 130 mL of MeOH) followed by 1 g of NaHCO<sub>3</sub>. The mixture was stirred 18 h at 70 °C, cooled to room temperature and poured into a  $Et_2O/H_2O$  mixture (1.5 L/200 mL). The organic solution was washed with  $H_2O$  (3 x 200 mL), and the combined aqueous solutions were extracted with Et<sub>2</sub>O (2 x 100 mL). The combined organic solutions were washed with saturated aqueous NaHCO3 and brine, then dried over MgSO4. The volatiles were removed under reduced pressure, and the residue was purified by flash chromatography (5% EtOAc in hexanes) to afford 614 mg of an inseparable mixture of mixed methyl ketal  $\alpha$ -66 contaminated with 304 mg of  $\beta$ -**66** and elimination product. Combined yield: 1.25 g (48 %) of methyl ketal  $\alpha$ -66. (3E)(2R)-2-Triethylsiloxyhexa-3,5-dien-1-ol (73). To a -78 °C solution of diol 72 (151.8 mg, 1.33 mmol) in 32 mL of CH<sub>2</sub>Cl<sub>2</sub> were added 2,6-lutidine (0.310 mL, 2.66 mmol) and acetyl chloride (0.100 mL, 1.40 mmol). The reaction was stirred for 1 h, then quenched with pH 7 phosphate buffer, diluted with EtOAc, and warmed to room temperature. The organic solution was separated and washed once with brine. The combined aqueous solutions were extracted once with EtOAc. The combined organic solutions were dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated. The residue was dissolved in 32 mL of CH<sub>2</sub>Cl<sub>2</sub>. Imidazole (453.3 mg, 6.66 mmol) was added, and the resulting solution was cooled to 0 °C. Chlorotriethylsilane (0.335 mL, 2.00 mmol) was added via syringe, and the reaction was stirred for 10 min, then diluted with pH 7 phosphate buffer and Et<sub>2</sub>O and warmed to room temperature. The organic solution was separated and washed once with brine. The combined aqueous solutions were extracted once with Et<sub>2</sub>O. The combined organic solutions were dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated. The residue was dissolved in 15 mL of toluene and cooled to -78 °C. DIBAIH (0.593 mL, 3.33 mmol) was added via syringe, and the reaction was stirred for 10 min, then quenched by addition of EtOAc. The solution was diluted with saturated aqueous sodium/potassium tartrate, allowed to warm to room temperature, and stirred vigorously for 12 h. The aqueous solution was separated and extracted with EtOAc (3 x). The combined organic solutions were dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated. Flash chromatography (3 x 12 cm silica gel, 7% ethyl acetate/hexanes) provided 271.5 mg (90%) of a clear oil.  $[\alpha]^{23}_{589}$  -12.2 (c 0.87, CH<sub>2</sub>Cl<sub>2</sub>); IR (neat) 3423, 2955, 2913, 2877, 1605 cm<sup>-1</sup>; <sup>1</sup>H NMR  $(500 \text{ MHz}, \text{CDCl}_3) \delta 6.32 \text{ (ddd, } J = 16.6, 10.4, 10.4 \text{ Hz}, 1\text{H}), 6.24 \text{ (dd, } J = 15.0, 10.6 \text{ Hz}, 1\text{H}), 5.62 \text{ (dd, } J = 16.0, 10.6 \text{ Hz}, 10.4 \text{$ 14.8, 6.9 Hz, 1H), 5.21 (d, J = 16.3 Hz, 1H), 5.10 (d, J = 9.6 Hz, 1H), 4.25 (dd, J = 10.9, 6.7 Hz, 1H), 3.53 (ddd, J = 11.2, 7.6, 4.1 Hz, 1H), 3.45 (ddd, J = 11.3, 6.6, 5.2 Hz, 1H), 2.02 (t, J = 7.0 Hz, 1H), 0.96 (t, J = 7.9 Hz,Hz, 9H), 0.62 (q, J = 7.9 Hz, 6H); <sup>13</sup>C NMR (125 MHz, CDCl<sub>3</sub>) δ 136.1, 133.1, 132.3, 117.8, 73.6, 66.9, 6.7, 4.9; exact mass calcd. for C12H24O2Si(NH4): 246.1889 found: 246.1886 (CI).

Methyl (5*E*)(4*S*)-2-[(dimethylamino)methyl]-4-triethylsiloxyocta-5,7-dienoate (74). To a -10 °C solution of 73 (127.9 mg, 0.56 mmol) in 1.5 mL of CH<sub>2</sub>Cl<sub>2</sub> were added pyridine (0.068 mL, 0.84 mmol) and trifluoromethanesulfonic anhydride (0.099 mL, 0.59 mmol). The reaction was stirred for 30 min, then diluted (5 x by volume) with hexanes. The resulting suspension was filtered through Celite, and the volume was reduced to ~0.5 mL by rotary evaporation at 0 °C. The remaining solution was cooled to -78 °C and further concentrated under a stream of nitrogen. In a separate flask, diisopropylamine (0.147 mL, 1.12 mmol) and 2 mL of THF were cooled to 0 °C. A 2.57 M solution of *n*-BuLi in hexanes (0.429 mL, 1.10 mmol) was added via syringe. After 15 min stirring, the reaction was cooled to -78 °C, and methyl- $\beta$ -dimethylaminopropionate (0.192 mL, 1.12 mmol) was added via syringe. The solution was stirred for 30 min, after which a solution of the triflate in 1.6 mL of THF and 0.6 mL of HMPA was added via cannula. After 30 min stirring, the reaction was quenched by addition of saturated aqueous NH<sub>4</sub>Cl, diluted with Et<sub>2</sub>O, and warmed to room temperature. The organic solution was separated, washed once with brine, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated. Flash chromatography (3 x 12 cm silica gel, 45% ethyl acetate/hexanes) provided 152.6 mg (80%) of 74 as a mixture of diastereomers. IR (neat) 2953, 2913, 2877, 2820, 2769, 1740, 1605 cm<sup>-1</sup>; <sup>1</sup>H NMR (400 MHz,

To aldehyde 83 (5.7 mg, 0.0035 mmol) was added 0.178 mL (0.036 mmol) of a 2-methyl-2-propene stock solution (0.2 M in t-BuOH) and 0.178 mL (0.018 mmol) of an ethyl 1-propenyl ether stock solution (0.1 M in t-BuOH) followed by 0.036 mL (0.018 mol) of a NaClO<sub>2</sub> stock solution (0.5 M in pH 5 phosphate buffer; prepared from 56.5 mg of NaClO<sub>2</sub> in 1.0 mL of buffer). Two additional portions of 3 equivalents of NaClO<sub>2</sub> solution were added after 1 and 2.5 h. After 3.5 h total stirring at room temperature, the reaction was diluted with an EtOAc/H<sub>2</sub>O mixture (20 mL/5 mL). The aqueous solution was extracted with EtOAc (10 mL) and  $CH_2Cl_2$  (2 x 10 mL). The combined organic solutions were dried over Na<sub>2</sub>SO<sub>4</sub> for 15 min, filtered, and concentrated. The residue was used directly for the next reaction without purification. To a 0 °C solution of the carboxylic acid (0.0035 mmol) in 0.285 mL of THF was added 0.071 mL of a HF•pyridine/THF solution (4 mL of HF•pyr, 8 mL of pyridine, and 32 mL of THF). The solution was stirred at 0° C for 3 h and diluted with a EtOAc/H<sub>2</sub>O mixture (20 mL/5 mL). The aqueous solution was extracted with EtOAc (10 mL) and CH<sub>2</sub>Cl<sub>2</sub> (2 x 10 mL). The combined organic solutions were dried over Na<sub>2</sub>SO<sub>4</sub> for 15 min, filtered, and concentrated. The residue was used directly in the next reaction without purification. To a solution of the seco acid (0.0035 mmol) in 0.350 mL of benzene was added diisopropylethylamine (0.012 mL, 0.07 mmol) followed by 2,4,6-trichlorobenzoyl chloride (0.011 mL, 0.07 mmol). This solution was stirred at room temperature for 3 h, after which a solution of DMAP (21.4 mg, 0.175 mmol) in 7.2 mL of benzene was added rapidly via cannula. After 3 h the cloudy solution was poured into a Et<sub>2</sub>O/saturated aqueous NaHCO<sub>3</sub> mixture. The organic solution was separated and washed with 1 N HCl, saturated aqueous NaHCO<sub>3</sub>, and brine, then dried over Na<sub>2</sub>SO<sub>4</sub> for 15 min. The volatiles were removed under reduced pressure, and the residue was purified by flash chromatography (10% acetone/hexanes) to afford 2.9 mg (55%, 3 steps) of macrolactone 84. Triisopropylsilyl-2-[(2S,4S,6R,8S,10S)-8-[(3R,4S,5S)-7-[(2S,4S,6R,8S,10S)-10-(tert-butyldimethylsiloxy)-8-[(1Z)-5-(2R,3S,4S,6R)-4-(tert-Butyldimethylsiloxy)-6-[(S)-[(2R,3S,4S)-3,4-dihydro-3-methyl-4-(triethylsiloxy)-2H-pyran-2-yl](triethylsiloxy)methyl]tetrahydro-6-methoxy-3-methyl-2H-pyran-2-yl]-1-pentenyl]-4-methoxy-1,7-dioxaspiro[5.5]undec-2-yl]-4-hydroxy-3,5-dimethyl-2-methylene-6-oxoheptyl]-4-hydroxy-10-methyl-10-(triethylsiloxy)-1,7-dioxaspiro[5.5]undec-2-yl]ethanoate, diacetate (86). To a room temperature solution of aldehyde 83 (26.6 mg, 0.0164 mmol) in 0.328 mL of t-butanol were added 2-methyl-2-butene (0.035 mL, 0.328 mmol) and ethyl propenyl ether (0.018 mL, 0.164 mmol). A 0.5 M solution of Na-ClO2 in pH 5 phosphate buffer (0.493 mL, 0.246 mmol) was then added via syringe. The reaction was stirred for 1 h, after which an additional 0.250 mL of NaClO<sub>2</sub> solution was added. Another 0.250 mL of NaClO<sub>2</sub> solution was added 1 h later. After 3.5 h total stirring, the reaction was diluted with EtOAc (20 mL) and water (5 mL). The aqueous solution was separated and extracted with EtOAc (1 x 10 mL) and CH<sub>2</sub>Cl<sub>2</sub> (2 x 10 mL). The combined organic solutions were dried over  $Na_2SO_4$ , filtered, and concentrated. The residue was dissolved in a 0.4 M solution of triethylamine in THF (0.493 mL, 0.197 mmol). A 0.4 M solution of chlorotriisopropylsilane in THF (0.246 mL, 0.099 mmol) was added via syringe. After 30 min stirring, an additional 0.250 mL of triethylamine solution and 0.125 mL of chlorotriisopropylsilane solution were added. After 1 h total stirring, the reaction was diluted with 2.5 mL of a 1 M solution of Et<sub>3</sub>NHOAc in THF and stirred for 1 min, then diluted with water (10 mL), saturated aqueous NaHCO<sub>3</sub> (2 mL), and Et<sub>2</sub>O. The organic solution was separated, washed with water (1 x), dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated. Flash chromatography (2 x 12 cm, linear gradient 5-10% acetone/hexanes) provided 21.3 mg (72%) of a clear oil.  $[\alpha]^{23}_{365}$  +23.6 (c 0.42, CH<sub>2</sub>Cl<sub>2</sub>); IR (CH<sub>2</sub>Cl<sub>2</sub>) 2954, 1728, 1606 cm<sup>-1</sup>; <sup>1</sup>H NMR (500 MHz, C<sub>6</sub>D<sub>6</sub>)  $\delta$  6.33 (d, J = 5.7 Hz, 1H), 5.75 (dd, J = 10.8, 8.2 Hz, 1H), 5.63-5.60 (m, 1H), 5.61 (dd, J = 9.8, 2.4 Hz, 1H), 5.51 (dt, J = 10.8, 8.2 Hz, 10.8, 10.8, 8.2 Hz, 10.8, 8.2 Hz, 10.8, 8.2 Hz, 10.8, 8.2 Hz, 10.8, 10.9, 7.3 Hz, 1H), 5.15 (s, 1H), 5.06 (br s, 1H), 4.96 (s, 1H), 4.64 (dd, J = 6.4, 1.3 Hz, 1H), 4.49 (m, 1H), 4.30-4.27 (m, 2H), 4.19 (br t, 1H), 4.07 (d, J = 11.3 Hz, 1H), 4.06 (s, 1H), 3.94-3.88 (m, 2H), 3.25 (m, 1H), 3.15 (s, 3H), 3.10 (dd, J = 18.7, 2.4 Hz, 1H), 3.05 (s, 3H), 2.95 (dq, J = 10.0, 6.8 Hz, 1H), 2.92 (dd, J = 15.8, 3.8 Hz, 1H), 2.76 (dd, J = 18.6, 10.0, 1H), 2.68 (m, 1H), 2.56-2.50 (m, 1H), 2.53 (dd, J = 15.8, 10.0 Hz, 1H), 2.46 (dd, J = 15.3, 3.5 Hz, 1H), 2.43-2.29 (m, 2H), 2.31 (septet, J = 7.4 Hz, 2H), 2.18-2.09 (m, 4H), 1.99 (br d, J = 14.6 Hz, 1H), 1.95-1.92 (m, 1H), 1.92 (s, 3H), 1.81-1.72 (m, 3H), 1.77 (s, 3H), 1.67-1.54 (m), 1.46-1.33 (m, 3H), 1.33-1.23 (m, 2H), 1.31 (d, J = 6.8 Hz, 3H), 1.20 (d, J = 6.8 Hz, 3H), 1.14-1.11 (m, 27H), 1.07 (s, 9H), 1.06-0.97 (m, 30H), 1.04 (s, 9H), 1.02 (m, 2H), 0.88-0.77 (m, 6H), 0.69-0.55 (m, 12H), 0.18 (s, 3H), 0.10 (s, 3H), 0.09 (m, 6H);  ${}^{13}$ C NMR (125 MHz, C<sub>6</sub>D<sub>6</sub>)  $\delta$  209.6, 170.6, 170.2, 168.7, 147.8, 144.0, 132.2, 130.9, 113.8, 105.2, 101.7, 98.3, 97.1, 78.2, 74.7, 73.8, 71.2, 70.9, 70.62, 70.56, 67.7, 66.8, 66.5, 65.2, 64.3, 62.3, 61.6, 55.1, 51.2, 47.8, 47.0, 45.5, 44.5, 42.9, 42.7, 39.3, 38.8, 38.7, 38.1, 38.0, 37.2, 34.8, 34.4, 33.0, 32.0, 30.7, 28.7, 26.9, 26.2, 26.1, 21.3, 20.5, 18.4, 18.0, 15.2, 13.7, 12.2, 12.0, 10.8, 7.6, 7.5, 7.3, 7.2, 6.2, 5.6, -4.3, -4.8, -4.9; Mass calcd. for C<sub>94</sub>H<sub>177</sub>O<sub>20</sub>Si<sub>6</sub>Na: 1816; found: 1816 (FAB, *m*-nitrobenzyl alcohol, NaI added). Dimethyldioxirane/acetone solution (prepared according to Murray, R. W.; Singh, M. Org. Synth. 1997, 74, 91-100) was diluted in CH<sub>2</sub>Cl<sub>2</sub> to a concentration of ~0.004 M (measured by addition to a known quantity of tri-O-benzyl glucal). The resulting solution (0.900 mL, ~0.0037 mmol) was added via syringe to a 0 °C solution of dihydropyran 86 (3.6 mg, 0.002 mmol) in 0.600 mL of CH<sub>2</sub>Cl<sub>2</sub>. After 5 min stirring, the reaction was concentrated under a steady stream of nitrogen. To the residue was added a solution of allylstannane 76c (16.03 mg, 0.032 mmol) in 0.111

mL of CH<sub>2</sub>Cl<sub>2</sub>, and the resulting solution was cooled to -78 °C. A solution of tributyltin trifluoromethanesulfonate (1.76 mg, 0.004 mmol) in 0.111 mL CH<sub>2</sub>Cl<sub>2</sub> was added rapidly via syringe. The reaction was stirred for 20 min, then quenched by addition of triethylamine (0.100 mL), diluted with saturated aqueous NaHCO<sub>3</sub> and Et<sub>2</sub>O, and warmed to room temperature. The organic solution was separated, washed with brine (1 x), dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated. Flash chromatography (1 x 12 cm, linear gradient 15-30% ethyl acetate/hexanes) provided 3.8 mg (94%) of a clear oil (unreacted 76c was recovered quantitatively). - 67. Preparation of 70 (R=H) by allylmagnesium bromide addition to 69 was reported independently by Stick and coworkers: (a) Best, W. M.; Ferro, V.; Harle, J.; Stick, R. V.; Tilbrook, D. M. G. Aust. J. Chem. 1997, 50, 463-472. See also: (b) Rainier, J. D.; Allwein, S. P. J. Org. Chem. 1998, 63, 5310-5311. These experiments are precedented by a single example of β-selective cuprate addition to Brigl's anhydride: (c) Bellosta, V.; Czernecki, S. J. Chem. Soc. Chem. Comm. 1989, 199-200. α-selective cuprate addition to a glycal epoxide was first reported by Kishi and coworkers: (d) Klein, L. L.; McWhorter, Jr., W. W.; Ko, S. S.; Pfaff, K.-P.; Kishi, Y. J. Am. Chem. Soc. 1982, 104, 7362-7364. For ZnCl<sub>2</sub> mediated sodium malonate additions to glycal epoxides, see: (e) Timmers, C. M.; Dekker, M.; van der Marel, G. A.; Ethell, B.; Anderson, G.; Burchell, B.; Mulder, G. J.; Van Boom, J. H. Bioorg. Med. Chem. Lett. 1997, 7, 1501-1506.
- 68. Kishi and coworkers have successfully applied an analogous allyl cuprate addition to an F-ring anomeric epoxide in their synthesis of altohyrtin A: Guo, J. S.; Duffy, K. J.; Stevens, K. L.; Dalko, P. I.; Roth, R. M.; Hayward, M. M.; Kishi, Y. Angew. Chem. Int. Ed. Engl. 1998, 37, 187-192.
- 69. Lubineau, A.; Auge, J.; Lubin, N. J. Chem. Soc. Perkin Trans 1 1990, 3011-3015. 72 is prepared in 3 steps from (S)-glyceraldehyde acetonide.
- 70. Rouvier, E.; Giacomoni, J.-C.; Cambon, A. Bull. Soc. Chim. France, 1971, 1717-1723.
- 71. This transformation has previously been accomplished in two steps (MeI, MeOH; DBN, benzene, reflux): Yu, L.-C.; Helquist, P. Tetrahedron Lett. 1978, 37, 3423-3426.
- 72. (a) Overman, L. E.; Renhowe, P. A. J. Org. Chem. 1994, 59, 4138-4142; (b) Weigand, S.; Bruckner, R. Synthesis 1996, 475-482.
- 73. We speculate that steric congestion around the reacting center lowers the nucleophilicity of the allylstannane. The consequent failure of the allylstannane addition to compete with nonproductive epoxide decomposition is presumed to be responsible for the lower yields observed for larger allylstannane protecting groups. Results in a similar system (epoxide 69) indicated that TBS (21% yield) and TBDPS (0% yield) protecting groups followed this trend.
- 74. See reference 65 for experimental details of the reaction in equation 14.
- 75. Unreacted aldehyde 42 (11%) was also recovered in diastereomerically pure form.
- 76. Bal, B. S.; Childers, W. E.; Pinnick, H. W. *Tetrahedron* 1981, 37, 2091-2096. Use of the scavenger ethyl 1-propenyl ether prevented decomposition of the acid-sensitive dihydropyran.
- 77. Inanaga, J.; Hirata, K.; Saeki, H.; Katsuki, T.; Yamaguchi, M. Bull. Chem. Soc. Jpn. 1979, 52, 1989-1993.
- 78. Baumstark, A. L.; McCloskey, C. J. Tetrahedron Lett. 1987, 28, 3311-3314.
- 79. Glycal epoxides are known to react readily with alcoholic solvents to give the corresponding epoxide-opened glycosides. Thus, the aliquots were dissolved in methanol, where any anomeric epoxide formed would be transformed to the corresponding methyl β-glycoside analog. Because C<sub>28</sub>-C<sub>29</sub> epoxides should not react with methanol, the epoxidation site selectivity can be discerned by mass spectral analysis.

- Information concerning the stereoselectivity of this epoxidation was not obtained from these small scale experiments. Epoxidation of a simple F ring acetate proceeded with 3:1 selectivity for the desired isomer. See also: Park, T. K.; Kim, I. J.; Hu, S.; Bilodeau, M. T.; Randolph, J. T.; Kwon, O.; Danishefsky, S. J. J. Am. Chem. Soc. 1996, 118, 11488-11500.
- In this system, overoxidation to give a mixture of diepoxides (presumably stereoisomers at C<sub>28</sub>-C<sub>29</sub>) was observed if dioxirane stoichiometry was not appropriately controlled.
- 82. The initial product of the reaction is the corresponding  $C_1$  TES ester, which is cleaved during purification on silica gel.
- 83. Professor G. R. Pettit is gratefully acknowledged for providing a natural sample of spongistatin 2.
- 84. We thank Professor Motomasa Kobayashi for providing NMR spectra of natural altohyrtin C.
- 85. This conclusion was subsequently corroborated by Kishi's total synthesis of altohyrtin A/spongistatin 1. See reference 1b.
