A series of novel 1,3,5-triarylpyrazoles **3a–3x** were synthesized from flavanones, arylhydrazines, and trimethyl phosphate in an one-pot procedure. Facile reaction process, easy after-reaction workshop, and good yields are the distinct characteristics of the developed protocol. The target compounds were characterized by element analysis, infrared ray (IR), ¹H NMR spectra, and electrospray ionization-mass spectrometry. The structure of representative compound **3h** (C₂₃H₂₀N₂O₃, *M_r* = 372.42) was further confirmed by X-ray diffraction. It crystallizes in monoclinic, space group P 2₁/c, *a* = 8.9720(5), *b* = 24.5523(13), *c* = 8.9687(6) Å, α = 90.0000°, β = 102.6417(17)°, γ = 90.0000°, *V* = 1927.76(20) Å³, *Z* = 4, μ(MoKα) = 0.086, *F*(000) = 784, *D_c* = 1.283 g/cm³, the final *R* = 0.0349 and *wR* = 0.0844 for 1668 observed reflections (*I* > 2σ(*I*)).

INTRODUCTION

Triaryl-substituted pyrazoles received substantial attention for their various biological activities, such as anticancer [1–3], anti-inflammatory [4], and so on [5]. Reported methods for the synthesis of 1,3,5-triarylpyrazoles, as cycloaddition using 3-aryl-2,3-epoxy-1-phenyl-1-propanones or cyclocondensation from 1,3-diphenylpropane-1,3-dione [6–9], usually result in the formation of isomers and involve multiple synthetic steps [10]. Thus, with the aim of refining and simplifying the synthetic protocol, we delivered a facile and efficient method for the synthesis of 1,3,5-triaryl-substituted pyrazoles from flavanones, arylhydrazines, and PO(OCH₃)₃ in a one-pot procedure.

RESULTS AND DISCUSSION

The synthetic procedure to obtain compound **3** (1,3,5-triarylpyrazoles) was discovered accidentally in one of our previous studies on pyrazole compound **2**. Treating **1** ((*E*)-1-phenyl-2-(2-phenyl-2,3-dihydrochromen-4-ylidene)hydrazine) with PO(OCH₃)₃ in solvent at temperature gave **3** in high yields instead of **2** (Scheme 1). Since **1** could be obtained through the reaction between compound **4** (2-phenyl-2,3-dihydrochromen-4-one) and compound **5** (1-phenylhydrazine), we supposed that compound **3** might be obtained directly from the reaction between compounds **4** and **5** in the presence of PO(OCH₃)₃ in

an one-pot procedure (Scheme 2), which was proved to be feasible as follows.

Various substituted flavanones (**4**) and arylhydrazines (**5**) were investigated to explore the optimal reaction condition, as well as the scope of our method. As shown in Table 1, substrates with aromatic ring bearing electron-withdrawing group, electron-donating group, and no substituent were involved, and most substrates led the corresponding products in moderate to good yields. Flavanone bearing methoxyl group tended to lead a slightly higher yield, while flavanone bearing electron-withdrawing group resulted in low yield and the reaction did not go smoothly at low temperature. High reaction temperature, up to 200°C, was required when 4-nitrophenylhydrazine and 4-methylsulfonyl phenyl hydrazine were used as the reactants. It was also noteworthy to mention that ortho-substituted phenylhydrazine significantly decreased reaction yield (**3k**), due to steric effect.

Products **3a–3x** were characterized by element analysis, IR, ¹H NMR spectra, and electrospray ionization-mass spectrometry (ESI-MS). The structure of compound **3h** was further confirmed by X-ray analysis (Figs. 1 and 2, CCDC(687044)). The selected bond lengths, bond angles, and torsion angles of **3h** are listed in Tables 3 and 4, respectively. Further details can be found in Table 2.

Structure analysis indicated that all ring atoms in the pyrazole moiety were nearly coplanar. The N(2)–C(4) bond length was 1.363(2), which was remarkably shorter

than a normal C—N bond (1.50 Å) but close to a typical C—N bond (1.32 Å) [11]. It was considered that atom N(2) made three sp²–sp² σ bonds with its neighboring atoms. Its lone pair electrons made π bond with the other four electrons (three from carbon atoms, one from nitrogen atoms N(1)). The dihedral shaped by pyrazole plane and aryl ring C(5)—C(6)—C(7)—C(8)—C(9)—C(10) was 167.5°, which also illustrated a coplanar structure. Due to the result of conjugation effect of aryl rings,

the bond distances of N(2)—C(19) (1.425 Å), C(4)—C(13) (1.475(2) Å), C(2)—C(5) (1.472(2) Å) were shorter than that of typical C—N (1.50 Å) and C—C bond (1.54 Å). In addition, X-ray analysis also revealed that the existence of an intramolecular hydrogen bond in the crystal and the bond length of O(3)—H(1)...N(1) was 2.548(2) (Table 5).

We speculated the mechanistic pathway for formation of pyrazoles as follows (Scheme 3). First, (*E*)-1-phenyl-2-(2-phenyl-2,3-dihydrochromen-4-ylidene)hydrazine was obtained by the reaction of 2-phenyl-2,3-dihydrochromen-4-one with 1-phenylhydrazine, and the arylhydrazone pyrone ring was opened. Then electronic rearrangement happened and 2-(1,5-diphenyl-4,5-dihydro-1H-pyrazol-3-yl)phenol was obtained. Finally, objective compound of 1,3,5-triarylpyrazole was successfully synthesized using PO(OCH₃)₃ as oxidant [11,12].

CONCLUSION

In summary, we have successfully developed a novel facile one-pot procedure for the synthesis of 1,3,5-triaryl substituted pyrazoles from flavanones, arylhydrazines, and $\text{PO}(\text{OCH}_3)_3$. The reaction products were prepared in moderate to good yield with different substituents.

EXPERIMENTAL

Melting points were determined on a Buchi B-540 apparatus and were uncorrected. All ^1H NMR spectra were recorded on a Bruker AM 400 with tetramethylsilane (TMS) as internal standard. Chemical shifts were reported in δ values (ppm) relative to internal TMS and J values were reported in Hertz. IR spectra were recorded using KBr pellets on a Bruker Vector-22 FTIR spectrophotometer. The elemental analysis was measured on a EA-300 analyzer and the MS(ESI) were measured on Esquire-LC-00075. X-ray diffraction data were collected on a Rigaku RAXIS-RAPID.

Representative procedure for preparation of 3h. 5,7-Dimethoxyflavanone (1) was prepared according to the literature [13]. Then the mixture of compound 1 (0.284 g, 1 mmol), phenylhydrazine hydrochloride 2 (0.173 g, 1.2 mmol), and $\text{PO}(\text{OCH}_3)_3$ (1 mL) was stirred at 110°C for 12 h. After cooling to room temperature, the reaction mixture was then added into water (20 mL) and then extracted with EtOAc
