**Just Accepted**

“Just Accepted” manuscripts have been peer-reviewed and accepted for publication. They are posted online prior to technical editing, formatting for publication and author proofing. The American Chemical Society provides “Just Accepted” as a service to the research community to expedite the dissemination of scientific material as soon as possible after acceptance. “Just Accepted” manuscripts appear in full in PDF format accompanied by an HTML abstract. “Just Accepted” manuscripts have been fully peer reviewed, but should not be considered the official version of record. They are citable by the Digital Object Identifier (DOI®). “Just Accepted” is an optional service offered to authors. Therefore, the “Just Accepted” Web site may not include all articles that will be published in the journal. After a manuscript is technically edited and formatted, it will be removed from the “Just Accepted” Web site and published as an ASAP article. Note that technical editing may introduce minor changes to the manuscript text and/or graphics which could affect content, and all legal disclaimers and ethical guidelines that apply to the journal pertain. ACS cannot be held responsible for errors or consequences arising from the use of information contained in these “Just Accepted” manuscripts.

14  
15 ABSTRACT: Multiple sclerosis (MS) is a disease of the autoimmune-mediated disorder  
16  
17  
18 in the central nervous system (CNS), for which no effective therapeutic agent is currently  
19  
20  
21  
22 available. The regulation of macrophage polarization towards M2 is a general benefit for  
23  
24  
25  
26 treating MS. The gene biomarker-based phenotypic screening approach was developed  
27  
28  
29 and 3,4-disubstituted piperidine derivative **S-28** was identified as a lead compound  
30  
31  
32  
33 modulating macrophage M2 polarization. Further SAR studies resulted in the discovery  
34  
35  
36 of the most potent modulator **D11** that showed good oral bioavailability and significant *in*  
37  
38  
39 *vivo* therapeutic effects. Mechanistic studies demonstrated that the M2 polarization  
40  
41  
42  
43 macrophages modulated by **D11** mainly functioned through inhibiting the proliferation of  
44  
45  
46  
47 T-cells and activating the phosphorylation of Stat3 and Akt. Therefore, the gene  
48  
49  
50 biomarker-based phenotypic screening was demonstrated as a promising tool for the  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 discovery of novel macrophage M2 polarization modulators. Compound **D11** may serve  
4  
5  
6  
7 as a promising starting point for the development of therapeutics to treat MS.  
8  
9  
10

## 11 **1. Introduction**

12  
13  
14  
15 Multiple sclerosis (MS) represents an immune-mediated chronic and demyelinating  
16  
17  
18 disease of the central nervous system (CNS),<sup>1, 2</sup> featuring perivascular leukocyte  
19  
20  
21 infiltrates, astrogliosis, axonal damage, and loss of function<sup>3, 4</sup>. In particular, MS is the  
22  
23  
24 most common cause of neurological disability among young adults, affecting  
25  
26  
27 approximately one in 1,000 individuals in both Europe and North America.<sup>5</sup> Clinically,  
28  
29  
30 there are various MS treatment approaches available that have been shown to decrease  
31  
32  
33 the frequency of relapses and delay disease progression. Examples include beta-  
34  
35  
36 interferons, glatiramer acetate, fingolimod, teriflunomide, dimethyl fumarate, natalizumab,  
37  
38  
39 and ocrelizumab.<sup>6</sup> However, there is no effective therapeutic agent that cures MS is  
40  
41  
42  
43 currently available. Most of the above-mentioned anti-MS drugs only relief the  
44  
45  
46  
47 development of MS progression. Moreover, the application of developed anti-MS-drugs  
48  
49  
50  
51 is often limited by frequently occurring side effects, including flu-like symptoms and the  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 development of other autoimmune disorders by interferon- $\beta$  or fingolimod.<sup>7, 8</sup> Hence, it is  
4  
5  
6  
7 of particular importance to identify more effective compounds with new mechanisms of  
8  
9  
10 action. Therefore, the development of more effective compounds as alternative  
11  
12  
13 approaches for the treatment of MS remains a critical, albeit unmet, scientific goal in MS  
14  
15  
16  
17 research.  
18  
19  
20

21 Macrophages exhibit a dynamic role in host defense and the maintenance of tissue  
22  
23  
24 homoeostasis. This necessitates a delicate balance between the proinflammatory and  
25  
26  
27 immunomodulatory functions to ensure appropriate responses to environmental stimuli.  
28  
29  
30

31 In general, macrophages can be broadly classified as M1 (classical) and M2 (alternative)  
32  
33  
34 subtypes based on function.<sup>9</sup> M1 macrophages are activated by LPS and/or IFN- $\gamma$  to  
35  
36  
37 elaborate proinflammatory cytokine production and tissue inflammation.<sup>10, 11</sup> Conversely,  
38  
39  
40  
41 M2 macrophages can be characterized by high expression of arginase 1 (Arg1), mannose  
42  
43  
44 receptor C-type 1 (Mrc1), resistin-like molecule alpha1 (Fizz1) on cell surface marker  
45  
46  
47  
48 CD206, stimulated by Th2 cytokines IL-4 or IL-13 to promote helminthic immunity,  
49  
50  
51  
52 fibrosis, allergy and immunomodulation.<sup>12, 13</sup>  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 The encephalomyelitis (EAE) model is a standard model for MS.<sup>14</sup> Recently,  
4  
5  
6  
7 macrophages have been shown to actively participate in the pathogenesis of EAE  
8  
9  
10 progression.<sup>14-16</sup> In particular, during the induction phase of EAE, it was found that the M1  
11  
12  
13 macrophages proportion increases in the spleen, resulting in the draining of lymph nodes  
14  
15  
16  
17 (dLNs) in C57BL/6 mice with early EAE.<sup>17</sup> In this state, M1-polarized macrophages were  
18  
19  
20  
21 found to exhibit the ability to induce neuronal destruction,<sup>18</sup> with symptoms of ongoing  
22  
23  
24 EAE worsening<sup>19</sup>. However, M2-polarized macrophages have been demonstrated to  
25  
26  
27  
28 produce pro-repair molecules, including the brain-derived neurotropic factor (BDNF), IL-  
29  
30  
31 10, and ferritin.<sup>20-23</sup> After administration of M2-activated macrophages, the development  
32  
33  
34 of an EAE model could be significantly suppressed.<sup>24, 25</sup> Importantly, pro-repair molecules  
35  
36  
37  
38 secreted by M2 macrophages favor the restoration of myelin and axons, which indicates  
39  
40  
41 particularly beneficial characteristics for the potential cure of MS.<sup>26-28</sup> Therefore, the  
42  
43  
44 inflammatory phenotype of macrophage cells is crucial for the EAE progression, revealing  
45  
46  
47  
48 that the regulatory control of macrophage polarization may be a promising strategy for  
49  
50  
51 the treatment of MS. However, the molecular mechanism of regulating macrophages M2-  
52  
53  
54  
55 polarization is still not very clear. To the best of our knowledge, there is no specific  
56  
57  
58  
59  
60

1  
2  
3 effective regulator to treat or control MS using this strategy. Therefore, it would be of  
4  
5  
6  
7 particular interest to explore small molecular compounds that could induce the M2-  
8  
9  
10 polarization of macrophages for MS therapy.

11  
12  
13  
14 In recent years, interest in phenotypic screening as a means for small-molecule drug  
15  
16  
17 discovery has continued to increase as an alternative to target-based screening.<sup>29, 30</sup>

18  
19  
20  
21 However, there is an ever-growing curiosity to elucidate potential benefits of combining  
22  
23  
24 phenotypic and genomic data, in an effort to advance small-molecule drug discovery.

25  
26  
27  
28 Accordingly, the distinct biomarkers of two inflammatory phenotypes (M1 and M2) of  
29  
30  
31 macrophage cells described herein render phenotypic screening suitable to find small  
32  
33  
34  
35 molecular regulators for macrophages M2-polarization. In previous work, we have  
36  
37  
38 established an effective evaluation system of macrophage polarization based on gene  
39  
40  
41 biomarkers such as *Arg1* and *Mcp1*.<sup>31</sup> As a continued study for identifying novel  
42  
43  
44  
45 macrophage M2 polarization modulators, we wonder whether this evaluation system can  
46  
47  
48  
49 be used for the discovery of novel macrophage M2 polarization modulators for the  
50  
51  
52 treatment of MS. Thus, similarity search and SAR studies involving different structural  
53  
54  
55  
56 moieties of different lead compounds were carried out based on in-house database  
57  
58  
59  
60

1  
2  
3 screening. This led to the identification of the most potent (both *in vitro* and *in vivo*)  
4  
5  
6  
7 compound **D11** (14-folds upregulation of M2 marker *Arg1*). Further mechanism studies of  
8  
9  
10 compound **D11** demonstrated that **D11** mainly functioned through inhibiting the  
11  
12  
13 proliferation of T-cells in EAE mouse model, and Stat3 and Akt proteins may be important  
14  
15  
16  
17 nodes for its regulation of macrophage M2 polarization.  
18  
19  
20

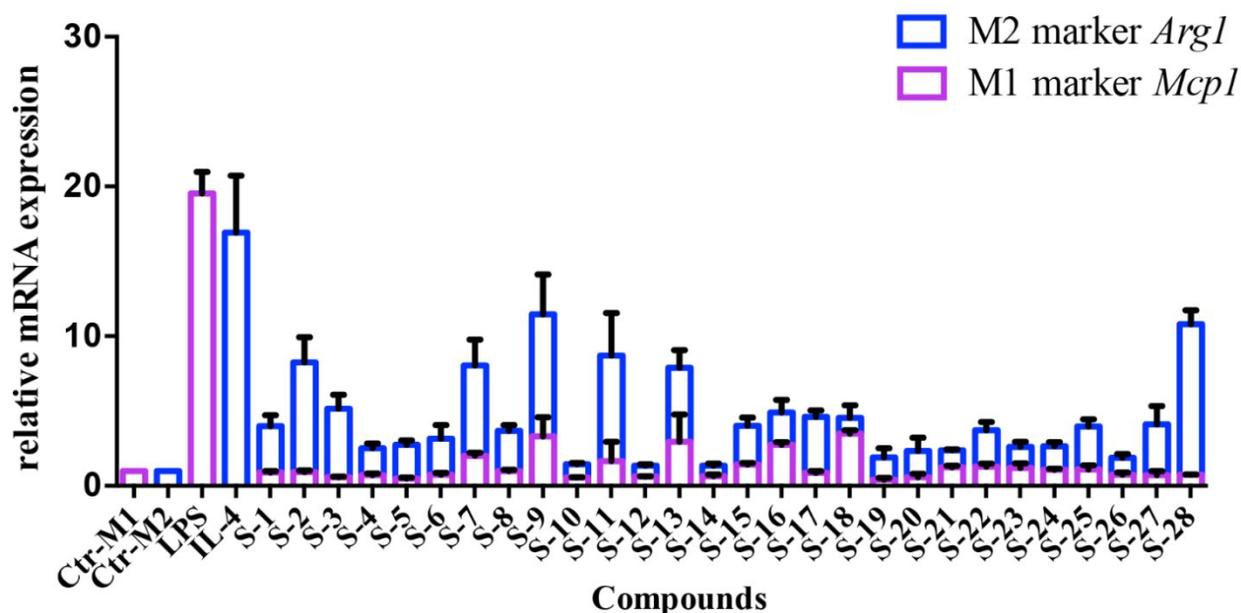

## 21 **2. Results and Discussion**

### 22 23 24 **2.1 Phenotypic screening of a structural diverse compound library**

25  
26  
27  
28 A structurally diverse compound library containing approximately 20,000 compounds  
29  
30  
31 was established in-house for phenotypic screening, assisted by cluster analysis. A total  
32  
33  
34 of 28 compounds with significantly different structural skeletons were selected (for  
35  
36  
37 corresponding compound structures see **Figure S1**). The murine macrophage cell line  
38  
39  
40 RAW264.7 was treated with different compounds for 24 hours. Then, the relative  
41  
42  
43 expression of macrophage M1 polarization biomarker *Mcp1* and M2 polarization  
44  
45  
46 biomarker *Arg1* were tested. As shown in **Figure 1**, several compounds demonstrated a  
47  
48  
49 good M2 polarization-inducing activity such as compound **S-2**, **S-7**, **S-9**, **S-11**, **S-13** and  
50  
51  
52  
53  
54  
55  
56 **S-28** (for corresponding data see **Table S1**). Specifically, treatment with compound **S-28**  
57  
58  
59  
60

(also termed as PZ8 in our database) was accompanied by the most remarkable elevation of the M2 marker *Arg1* mRNA expression and the least upregulation of M1 marker *Mcp1* mRNA expression among all studied compounds.

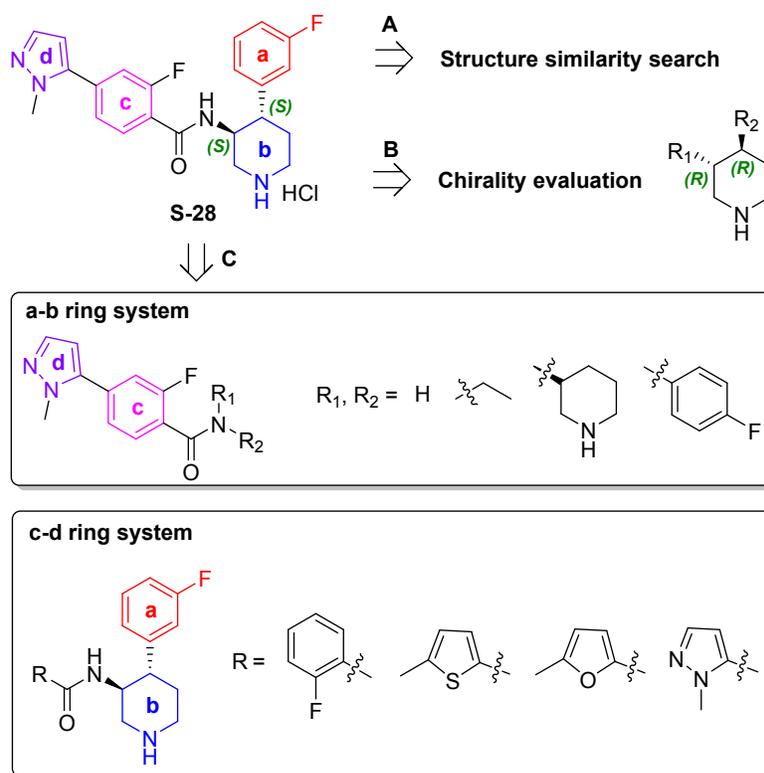

## Results of phenotypic screening

**Figure 1.** Compound S-28 promoted macrophages M2 polarization most effectively; (blue) Quantitative real-time polymerase chain reaction (qRT-PCR) analysis for expression of macrophage M2 phenotype gene *Arg1* in RAW264.7 cells treated with 28 compounds (300 nM) for a total 24 hours. IL-4 (20 ng/ml) was used as positive control; (purple) qRT-PCR analysis for expression of macrophage M1 phenotype gene *Mcp1* in RAW264.7 cells

1  
2  
3 treated with 28 compounds (300 nM) for 24 hours. LPS (50 ng/ml) was used as positive  
4  
5  
6  
7 control.  
8  
9

10  
11 Compound **S-28** (Figure 2) was composed of four rings, **a**, **c** and **d** rings represented  
12  
13 aryl rings, and the **b** ring represented a saturated (3S, 4S)-piperidine ring. In order to  
14  
15 explore the structure-activity relationship of compound **S-28** and in an effort to identify  
16  
17 more potent M2 polarization modulators, three strategies were applied: A) A structure  
18  
19 similarity search was performed using a Molport database for the purpose of extending  
20  
21 the structural diversity based on the skeleton of compound **S-28**; B) It was also found that  
22  
23 two chiral centers were present in the **b** ring. Therefore, the influences on M2 polarization  
24  
25 modulation activity of the chiral centers was also evaluated; C) In order to explore SAR  
26  
27 at the initial stage, the four different ring systems and two rings in compound **S-28** were  
28  
29 retained such as the **a-b** and **c-d** ring systems. Substituted phenyl, heterocycles or  
30  
31 saturated chains were selected as substituents of the **a-b** or **c-d** ring systems.

### 2.2 The synthetic route of compounds B1, C1-C11 and D1-D21

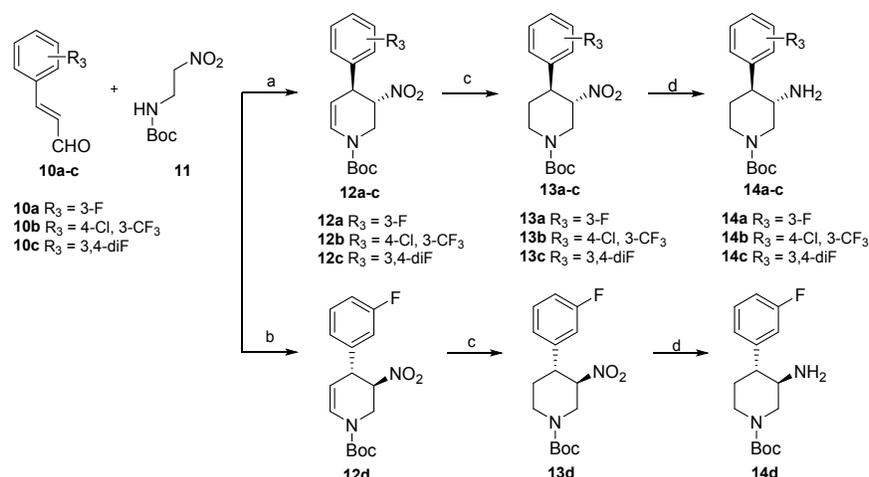

*Synthesis of biaryl carboxylic acid 3a-c, 6a-c, and 9a-j.* The synthetic route for the production of the acid fragments is shown in **Scheme 1**. Different esters (**1a-b**, **4**, **7a-d**) were used as starting materials. The coupling reaction with 1-methyl-5-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-1H-pyrazole provided compounds **2a-b**, **5** and **8a-d**. After electrophilic reaction with NBS or NCS and hydrolysis, the biaryl carboxylic acids **3a-c**, **6a-c** and **9a-j** were obtained.

**Scheme 1.** (a) 1-methyl-5-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-1H-pyrazole,

$\text{Pd}(\text{PPh}_3)_4$ ,  $\text{K}_3\text{PO}_4$ , DMF; (b) NBS or NCS, dichloromethane; (c) NaOH,  $\text{H}_2\text{O}/\text{EtOH}$ .

**Synthesis of 3-amino-4-aryl piperidine 14a-d.** The synthetic route to obtain a series of 3,4-disubstituted piperidine compounds is shown in **Scheme 2**. Compounds **10a-c** underwent R or S Jorgensen-Hayashi reagent catalyzed cyclization with compound **10** to provide the (3S,4S) compound **12a-c** and (3R,4R) compound **12d**. Treatment of compound **12a-d** with  $\text{EtSiH}$ , and following in the presence of  $\text{Fe}/\text{NH}_4\text{Cl}$  provided 3-amino-4-aryl piperidine.

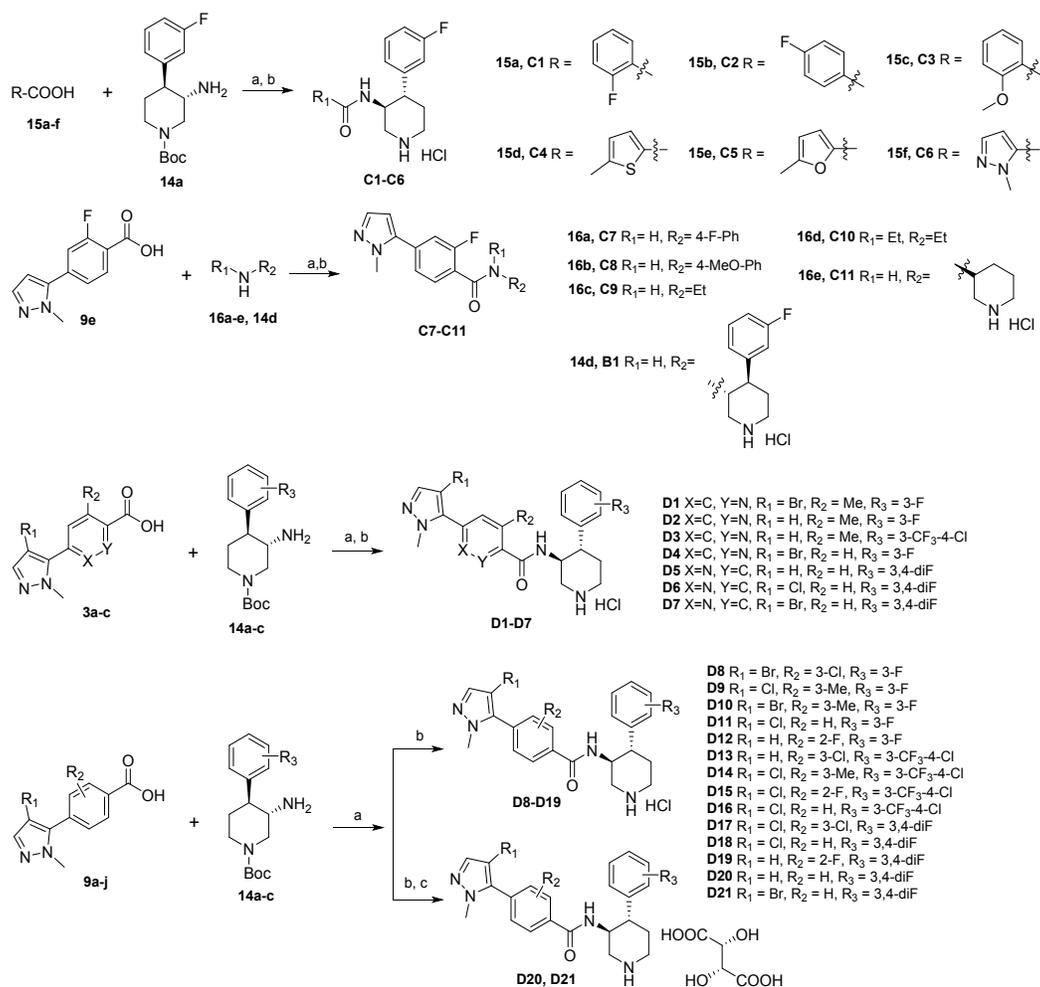

**Scheme 2.** (a) (S)-2-(diphenyl((trimethylsilyl)oxy)methyl)pyrrolidine, dichloromethane; ii. TFA, dichloromethane; (b) (R)-2-(diphenyl((trimethylsilyl)oxy)methyl)pyrrolidine, dichloromethane; ii. TFA, dichloromethane; (c) i. EtSiH, TFA; ii. Boc<sub>2</sub>O, TEA, dichloromethane; (d) Fe, NH<sub>4</sub>Cl, EtOH/H<sub>2</sub>O.

**Synthesis of target compounds B1, C1-C11, and D1-D21.** The synthetic route for the production of the target compounds is shown in **Scheme 3**. Treatment of aryl acids with aliphatic amines in the presence of EDCI and HOBT provided the condensed intermediates. Then, deprotection with HCl in ethyl acetate yielded the target compounds **B1, C1-C11, D1-D19**. For compounds **D20** and **D21**, L-tartrate was introduced to replace hydrochloride as a counteranion. In doing so, the target compounds could be obtained as

white solids as opposed to colorless oils in the case of hydrochloride as a counteranion.

The purities of all synthesized compounds were over 95 %.

**Scheme 3.** (a) EDCI, HOBt, DIPEA; (b) EA, HCl; (c) L-Tartaric acid.

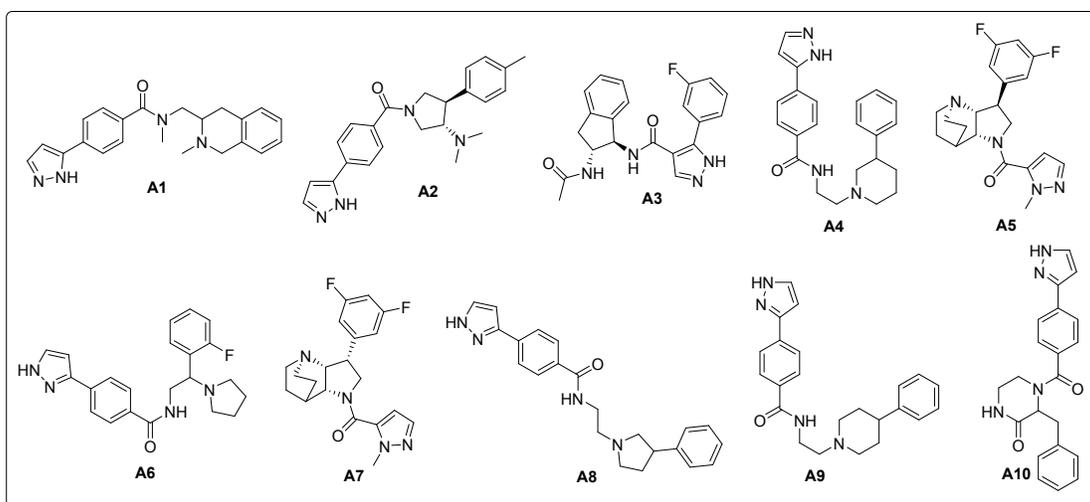

### 2.3 *In vitro* evaluation of macrophage polarization gene biomarker expression fold change

Ten different structures were selected from the Molport database based on similarity search results (**Table 1**). Unfortunately, among these structures, we could not identify any

1  
2  
3 other more potent skeletons. The bioactivity test results (Table 1) indicated that most of  
4  
5  
6  
7 the study compounds exhibited low macrophage M2 or M1 polarization induced activity.  
8  
9  
10 Specifically, compounds **A2** and **A9** displayed about 4-fold upregulation of *Arg1*  
11  
12  
13  
14 expression, however, the activity was significantly lower than that of compound **S-28**.  
15  
16

17 **Table 1.** Macrophage polarization gene biomarker expression fold change of compound  
18  
19

20

22  
23  
24

Cpd.	M2 marker Arg1		M1 marker Mcp1	
	Fold <sup>a</sup>	SEM	Fold <sup>a</sup>	SEM
Ctrl	1	0	1	0
A1	2.35	0.08	1.14	0.42
A2	4.85	1.04	1.24	0.57

<b>A3</b>	0.80	0.10	2.14	0.66
<b>A4</b>	1.48	0.97	1.52	0.07
<b>A5</b>	1.16	0.26	1.40	0.39
<b>A6</b>	1.09	0.50	1.34	0.05
<b>A7</b>	2.22	0.33	1.95	0.25
<b>A8</b>	2.22	0.45	1.86	0.18
<b>A9</b>	3.92	2.22	2.14	0.33
<b>A10</b>	1.33	0.36	1.53	0.35

<sup>a</sup> Gene expression was determined by qRT-PCR, the fold change was calculated as follows: gene expression level of Dosing group/gene expression level of Control group.

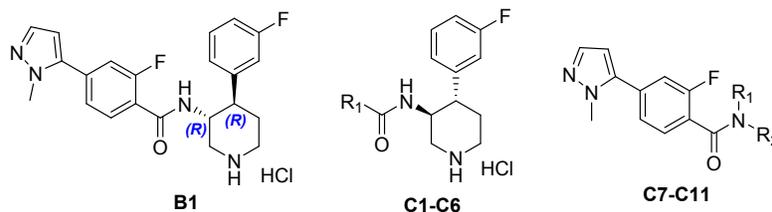

A further study of compound **S-28** focused on chirality and the exploration of other ring systems. As shown in **Table 2**, compound **B1** bearing a (3R,4R)-disubstituted-piperidine ring showed a dramatical loss of M2 polarization induced activity (0.31-fold upregulation of *Arg1*), while the expression of M1 marker *Mcp1* could still be retained (1.76-fold upregulation of *Mcp1*), indicating that the (3S,4S)-disubstituted-piperidine ring was indeed essential in maintaining compound activity.

When the **c-d** ring system was replaced by substituted phenyl or heteroaromatic rings such as compound **C1-C6**, both exhibited no obvious influences on *Mcp1* expression or

upregulation of *Arg1* expression. As for the **a-b** ring system that was replaced by other substituents (compound **C7-C11**), the results were performed in the same manner as the lack of the **c-d** ring system. The ablation of only the **a** ring (compound **C11**) or the **d** ring (compound **C1**) caused the loss of induced potency. Therefore, we speculated that the **a**, **b**, **c** and **d** rings were both essential for keeping the induce activity of compound **S-28**.

**Table 2.** Macrophage polarization gene biomarker expression fold change of compound

<sup>a</sup> Gene expression was determined by qRT-PCR, the fold change was calculated as follows: gene expression level of Dosing group/gene expression level of Control group.

The subsequent adjustment of the skeleton was mainly carried out on the substituents of the four rings. When the pyridine ring was substituted for the **b** ring, compound **D1-D7** showed no improvements in induced activity (**Table 3**). Based on the above SAR study, we deemed the skeleton highly conserved, and fine-adjustment of compound **S-28** may lead to the identification of an even more potent compound. Compounds **D8-D21** were synthesized and tested and the corresponding results are shown in **Table 3**. Compounds **D8, D11, D12, and D15** demonstrated an over 10-fold up-regulation of the M2 marker *Arg1*. As expected, most of the compounds showed less potency in elevating the M1

marker *Mcp1*, except for compounds **D14-D16**. Here,  $R_3$  was substituted with 3-CF<sub>3</sub>-4-Cl. However, compound **D11** showed the strongest ability to promote expression of the M2 marker *Arg1* in RAW264.7 and much lower upregulation of M1 marker *Mcp1* mRNA expression (**Figure 3A**). Furthermore, RAW264.7 cells were treated with LPS, accompanied by administration of the potent M2 polarization modulators **D8**, **D11**, **D12**, and **D15**. It was found that compound **D11** could also reverse the up-regulation of M1 marker *Mcp1* expression induced by LPS (**Figure 3B**). Thus, compound **D11** was selected for the following pharmacokinetic and pharmacodynamic studies.

**Table 3.** Macrophage polarization gene biomarker expression fold change of compound

<sup>a</sup> Gene expression was determined by qRT-PCR, the fold change was calculated as follows: gene expression level of Dosing group/gene expression level of Control group.

**Figure 3.** (A) (Blue) qRT-PCR analysis to determine the expression of macrophage M2 phenotype gene *Arg1* in RAW264.7 cells treated with compounds (300 nM) for 24 hours. IL-4 (20 ng/ml) was used as positive control. (Purple) qRT-PCR analysis for the determination of macrophage M1 phenotype gene *Mcp1* expression in RAW264.7 cells treated with compounds (300 nM) for 24 hours. LPS (50 ng/ml) was used as positive control; (B) qRT-PCR analysis for the determination of macrophage M1 phenotype gene *Mcp1* expression. RAW264.7 cells were pre-treated with LPS (50 ng/ml) for 24 hours and subsequently treated with compounds (300 nM) for 24 hours. Data is shown as mean  $\pm$  S.E.M in the graphs.

## 2.4 *In vivo* pharmacokinetic evaluation

Definitive single-dose pharmacokinetic studies were conducted in rats (**Table 4**). Compound **D11** demonstrated excellent absolute oral bioavailability in rats with F values of 50.63%. In addition, the compound showed good clearance and oral absorption ( $t_{1/2}$ = 3.3 h,  $C_{max}$ = 313 ng/mL,  $AUC_{0-t}$ = 4669  $\mu$ g /L·h) characteristics. These data suggested that compound **D11** constitutes a reasonable starting point for further drug development studies.

**Table 4.** Pharmacokinetic parameters of **D11** in Sprague-Dawley (SD) Rat

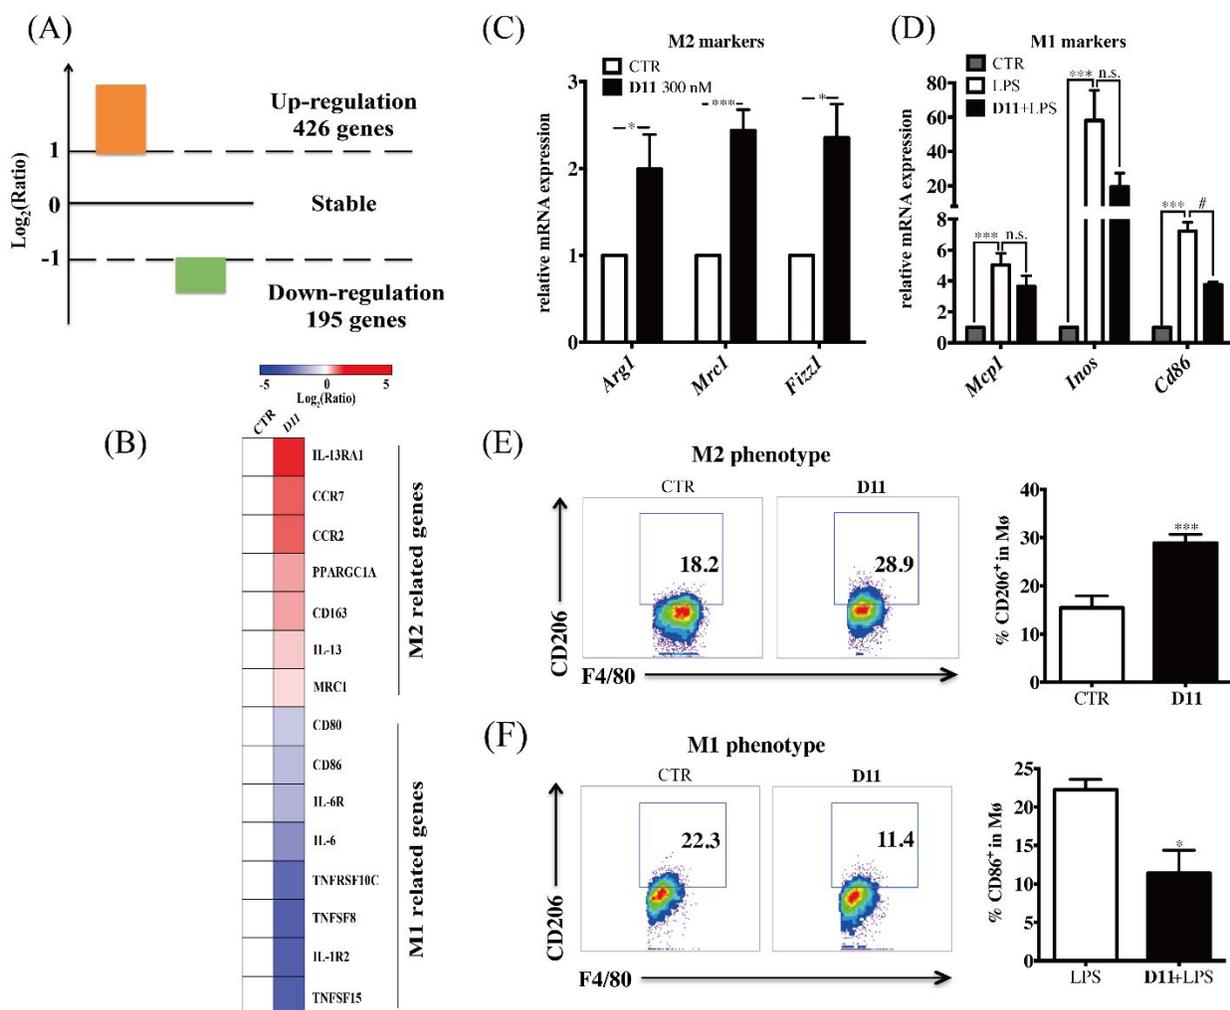

Parameters	Compound <b>D11</b>	
	50 mg/kg	10 mg/kg
	Oral	Intravenous
$T_{max}$ (h)	3.25±0.5	0.083±0.02
$T_{1/2}$ (h)	7.77±1.52	6.30±1.90
$C_{max}$ ( $\mu$ g/L)	313.23±87.45	1001.40±423.30
$AUC_{0-t}$ ( $\mu$ g /L·h)	4669.27±1165.37	1844.42±568.57
$AUC_{0-\infty}$ ( $\mu$ g /L·h)	4743.69±1166.54	1869.93±585.16

11 **2.5 Compound D11 changes macrophage polarization balance towards M2**  
12

13  
14 In **D11**-treated RAW264.7 cells, the microarray analysis result indicated that **D11**  
15  
16 activated M2 macrophage marker genes but suppressed M1 marker genes (**Figure 4A,**  
17  
18 **B**). Compared to the passage cell line RAW264.7, bone marrow-derived macrophages  
19  
20 (BMDM) present a more ideal *in vitro* model to understand the mechanisms controlling  
21  
22 polarization of activated macrophages.<sup>32</sup> It was further demonstrated that the M2  
23  
24 macrophages marker CD206 expression was elevated (**Figure 5A**) and M1 macrophages  
25  
26 marker CD86 expression was suppressed dose-dependently after treatment with **D11**  
27  
28 (**Figure 5B**) on BMDMs.  
29  
30  
31  
32  
33  
34  
35  
36  
37  
38  
39  
40  
41

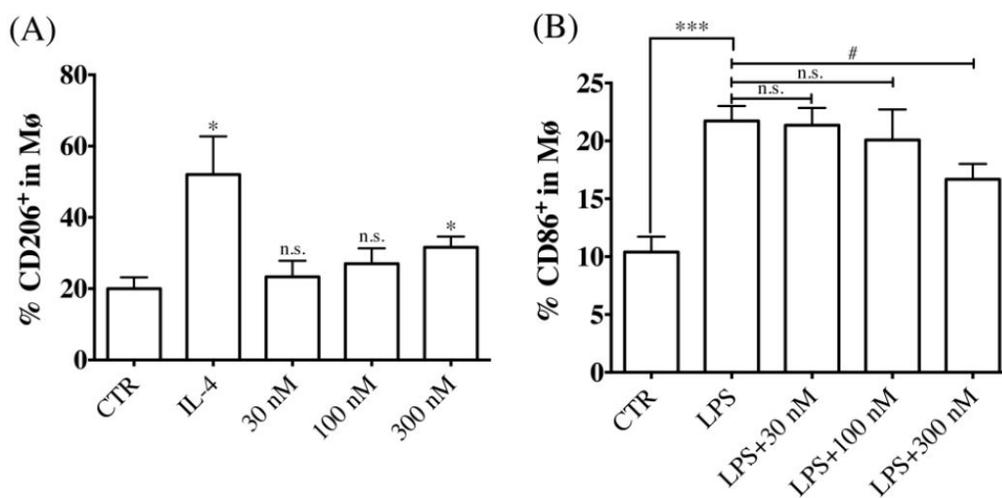

42 Hence, the BMDM cell line was used for further bio-mechanistic studies of compound  
43  
44 **D11**. Treatment of BMDMs with 300 nM **D11** resulted in an increase of mRNA levels of  
45  
46 the M2 markers *Arg1*, *Mrc1*, *Fizz1* (**Figure 4C**). Furthermore, compound **D11** at a  
47  
48 concentration of 300 nM reversed the elevation of mRNA levels of the M1 markers *Mcp1*,

3 *Inos* and *Cd86* stimulated by LPS (**Figure 4D**). Meanwhile, the western blot analysis also  
4  
5  
6  
7 showed that the expression level of macrophage M2 polarization marker Arg1 and Ym1  
8  
9  
10 proteins increased while the M1 polarization marker Tnf- $\alpha$  protein was still remained  
11  
12  
13 (**Figure S2**). Furthermore, treatment of BMDM cells with 300 nM of **D11** increased the  
14  
15  
16  
17 expression of the M2 macrophages marker CD206 (**Figure 4E**) and suppressed the  
18  
19  
20  
21 expression of the M1 macrophages marker CD86 stimulated by LPS (**Figure 4F**) as

## 25 2.6 Therapeutic effect of compound D11 in EAE model

26  
27  
28 Since the Myelin Oligodendrocyte Glycoprotein (MOG) has emerged as one of the most  
29  
30  
31 important target antigens in MS,<sup>14</sup> the *in vivo* therapeutic effect of compound **D11** was  
32  
33  
34 evaluated in a MOG<sub>35-55</sub> induced mouse EAE model. Further safety evaluation of **D11** on  
35  
36  
37  
38 healthy mice indicated that no other obvious side effects were observed except for  
39  
40  
41 immunosuppressive activity (which is beneficial in EAE and MS) at 400 mg/kg (**Figure S3**,  
42  
43  
44  
45  
46 **Table S2**, and **S3**). To avoid the potential side effects caused by excessive  
47  
48  
49 immunosuppression and maintain the exposure of **D11** being above 300 nM, the doses  
50  
51  
52  
53 of 100 mg/kg and 200 mg/kg were chosen as the therapeutic doses in animal EAE study.  
54  
55  
56  
57  
58  
59  
60

1  
2  
3  
4 The therapeutic administration of the drug (**D11**, 100 mg/kg and 200 mg/kg, ig, qd) was  
5  
6  
7 performed after day 8, right after the appearance of clinical symptoms of EAE (**Figure**  
8  
9  
10 **6A**). Dexamethasone (DXM), which is the first choice for the treatment of acute relapses  
11  
12  
13 of multiple sclerosis,<sup>33</sup> was also observed therapeutic effect in the EAE model when  
14  
15  
16 treating with dexamethasone as reported,<sup>34</sup> so it was chosen as a positive control. The  
17  
18  
19 data indicated that when administered at 200 mg/kg, compound **D11** clearly reduced  
20  
21  
22 disease progression, as observed by a significantly lower average clinical score in EAE  
23  
24  
25 mice administrated with 200 mg/kg of compound **D11** compared to vehicle-treated EAE  
26  
27  
28 mice (**Figure 6B**). Accordingly, H&E and LFB histological analysis of the affected spinal  
29  
30  
31 cord indicted that treatment with 200 mg/kg of **D11** attenuated demyelination and  
32  
33  
34 inflammation in EAE mice (**Figure 6C and D**). To study the effect of treatment with  
35  
36  
37 compound **D11** on the pro-inflammatory cells Th1, and Th17 infiltration into the CNS, we  
38  
39  
40 isolated mononuclear cells (MNCs) from the CNS (spinal cords and brains) of EAE mice.  
41  
42  
43 Then, we performed flow-cytometry analysis and detected a remarkable percentage  
44  
45  
46 reduction of both Th1 and Th17 in CD4<sup>+</sup> T-cells of **D11**-treated EAE mice (**Figure 6E and**  
47  
48  
49 **F**).

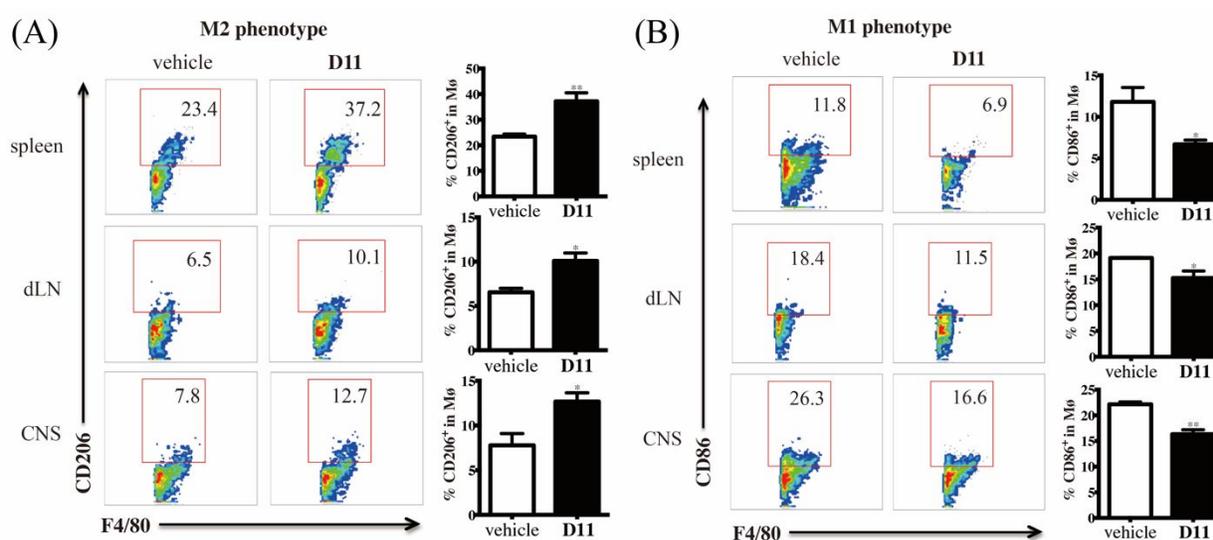

**Figure 6.** Compound D11 ameliorated clinical severity and limited CNS autoimmunity of EAE mice. (A) Schematic representation of EAE model. (B) *In vivo* effect of compound D11 on EAE mice. EAE mice were treated with D11 (100 mg/kg, 200mg/kg, i.g.), dexamethasone (10 mg/kg, i.g.) or vehicle (saline, i.g.). Mean clinical scores are shown (n=5). (C,D) H&E and Luxol fast blue (LFB) staining of spinal cords from vehicle- and

## 29 **2.7 Compound D11 distorts macrophages polarization towards M2 *in vivo***

31  
32 To evaluate the *in vivo* effect of compound **D11** on modulating the polarization of  
33  
34  
35 macrophages, flow cytometry was used to assess the polarization of macrophages in  
36  
37  
38  
39 EAE mice between day 13 to day 19 after induction of EAE. As shown in **Figure 7A**, the  
40  
41  
42 proportion of M2 macrophages (F4/80 $^+$ CD206 $^+$ ) in total macrophage populations (F4/80 $^+$ )  
43  
44  
45  
46 from both peripheral immune organs (spleen and draining lymph nodes) and the CNS  
47  
48  
49 (spinal cord and brain) was found to be significantly elevated in 200 mg/kg **D11-treated**  
50  
51  
52  
53 mice compared to vehicle-treated EAE mice. Conversely, the percentage of M1  
54  
55  
56  
57  
58  
59  
60

1  
2  
3  
4 macrophages (F4/80<sup>+</sup>CD86<sup>+</sup>) in total macrophage populations (F4/80<sup>+</sup>) was found to be  
5  
6  
7 declined in 200 mg/kg D11-treated mice compared with vehicle-treated EAE mice (Figure  
8  
9  
10  
11 7B). In addition, the influence on dendritic cells and T<sub>reg</sub> cells wasn't observed in D11-  
12  
13  
14 treated EAE mice (Figure S4).

## 10 11 **2.8 Studies of compound D11 on crosstalk between macrophages and CD4<sup>+</sup> T cells** 12 13

14  
15 Our data indicated that treatment with compound **D11** altered the polarization of  
16  
17 macrophages towards an anti-inflammatory phenotype. We then addressed the issue of  
18  
19 functionality of **D11**-treated macrophages. As a potent member of the myeloid lineage,  
20  
21 during the induction phase of EAE, M1 macrophages adapt an antigen presenting cell  
22  
23 (APC)-like capacity to active CD4<sup>+</sup> T cells proliferation and differentiation.<sup>35</sup> Importantly,  
24  
25 compound **D11** suppressed M1 macrophages-driven T-cell proliferation (**Figure 8A** and  
26  
27 **B**). Furthermore, **D11**-treatment decreased the production of the Th1 and Th17 cell  
28  
29 signature cytokines IFN- $\gamma$  and IL-17A (**Figure 8C** and **D**).  
30

**Figure 8.** D11-treated macrophages inhibited the proliferation of CD4<sup>+</sup> T cells. (A, B)

BMDM cells were treated with 50 ng/ml LPS or with 300 nM of compound D11 for 48

hours. Then, BMDM cells were co-cultured with CD4<sup>+</sup> T cells and proliferation was

determined after 72 hours. Histograms display proliferation profiles of CD4<sup>+</sup> T-cells.

Graphs display mean fluorescence intensity (MFI) of the proliferation dye CFSE and

proliferation percentages of CD4<sup>+</sup> T-cells. (C, D) Co-culture supernatant was collected for

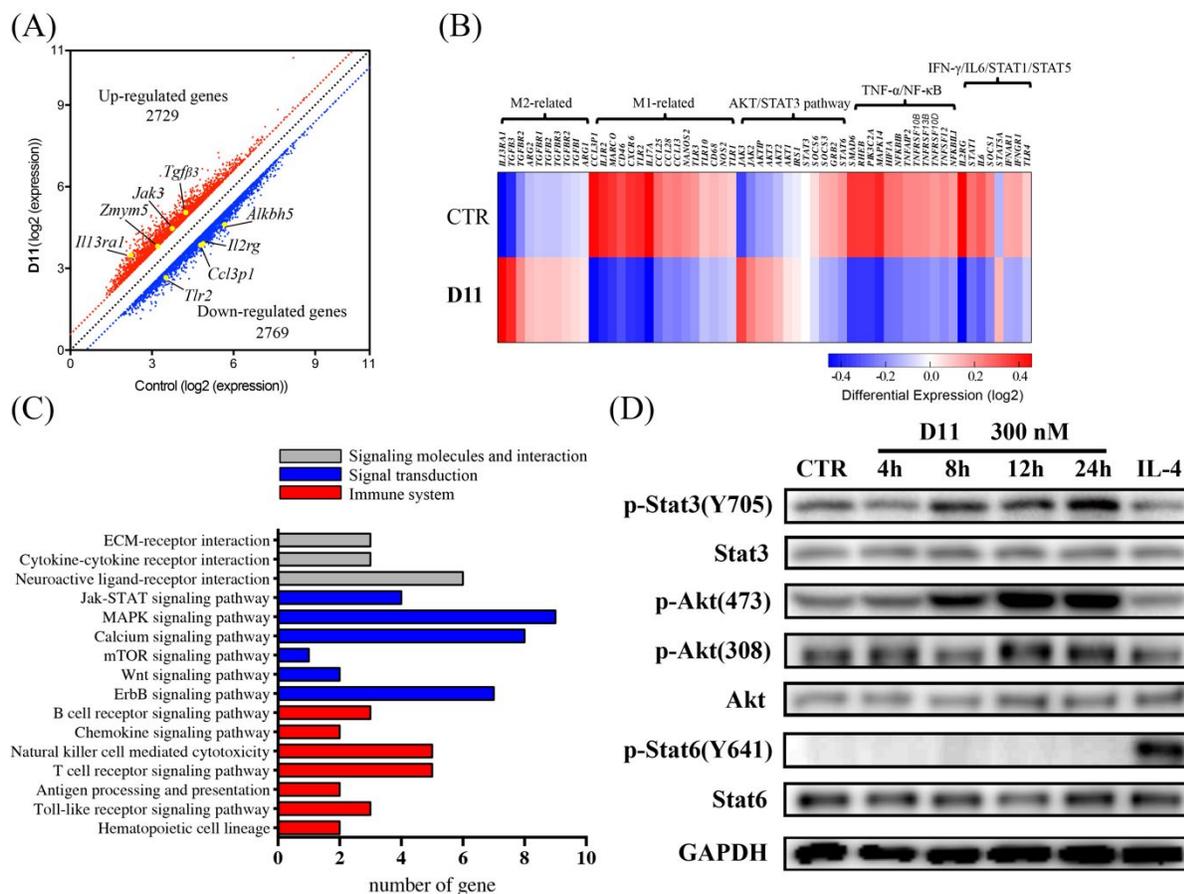

ELISA analysis of IFN- $\gamma$  and IL-17 secretion. Data is shown as mean  $\pm$  S.E.M in the

graphs. \* $P < 0.05$ , \*\* $P < 0.01$ , n.s.  $P > 0.05$  versus control.

## 2.9 Compound D11 promotes macrophages polarization via activating Akt/Stat3 pathways

In order to fully comprehend the mechanisms involved in the processes described above, microarray analysis was performed using a gene chip technology. RAW264.7 cells were treated in the absence or presence of 300 nM of compound **D11** for 24 hours. Among the altered genes (2729 upregulated vs. 2769 downregulated, **Figure 9A**), the potential target genes in response to **D11** treatment were listed in **Figure 9B**, which could well explain the mechanism of macrophages M2 polarization. A number of TLR ligands and cytokines such as TLR4 and IL-6 are potent macrophages M1 polarization promoters, which lead to activation of pro-inflammatory transcription factor STAT1 and NF- $\kappa$ B.<sup>36</sup> Cytokine IL-4 activated Stat6 and IL-10 activated Stat3, which in turn activated transcription of genes typical of M2 polarization, e.g., mannose receptor (Mrc1), resistin-like  $\alpha$  (Retnla, Fizz1), chitinase 3-like 3 (Chi3l3, Ym1), IL-10 and TGF- $\beta$ .<sup>37, 38</sup> Among all altered genes, Kyoto Encyclopedia of Genes and Genomes (KEGG) pathway classification analysis<sup>39, 40</sup> showed that the genes of the immune system and signal transduction were the most altered (**Figure 9C**). Based on the microarray analysis results,

1  
2  
3 we further found that the significantly differentially expressed (SDE) genes such as IKK,  
4  
5  
6  
7 Pim-1, AMLI-ETC, and PML-RAR $\alpha$  proteins mainly belonged to the Jak-Stat and PI3K-  
8  
9  
10 Akt signaling pathway (**Figure S5**). Subsequently western blot analysis was performed as  
11  
12  
13  
14 shown in **Figure 9D**. Compound **D11** was demonstrated to promote phosphorylation of  
15  
16  
17 Akt at both sites of 308 and 473, and phosphorylation of Stat3, but didn't influence  
18  
19  
20 phosphorylation of Stat6. This finding is believed to be due to Stat3 and Akt protein  
21  
22  
23  
24 representing an important node in modulating macrophage M2 polarization after  
25  
26  
27  
28 treatment with compound **D11**.

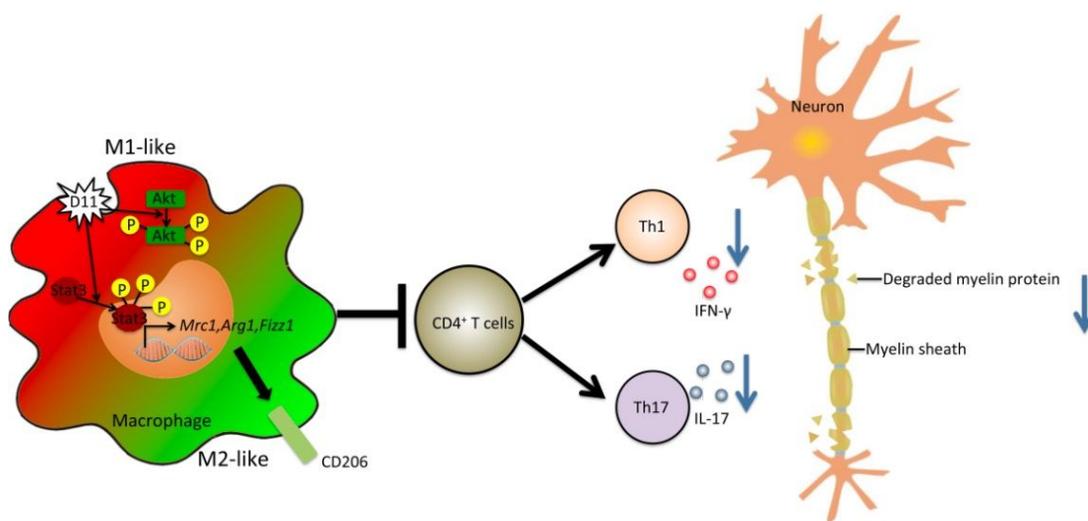

**Figure 9.** (A) Volcano plot of differentially expressed genes by microarray analysis on D11 treated macrophages Raw 264.7. (B) Heatmap of differentially expressed genes by microarray analysis on D11 treated macrophages Raw 264.7. (C) Changes of gene expression in the KEGG pathway analysis. (D) Western blotting shows the expression level of Akt/p-Akt(473)/p-Akt(308), Stat3/p-Stat3(Y705) and Stat6/p-Stat6 protein, GAPDH was used as loading control.

### 3. Conclusions

1  
2  
3  
4 Macrophages exhibit important roles in the development of MS. M1 polarization  
5  
6  
7 macrophages exert pathogenic effects while M2 polarization macrophages present an  
8  
9  
10 anti-inflammatory phenotype. Thus, molecular intervention to alter macrophages  
11  
12  
13 polarization towards M2 poses as a potential therapeutic approach for the treatment of  
14  
15  
16 MS. Compound **S-28** bearing a 3,4-disubstituted piperidine skeleton was identified from  
17  
18  
19 an in-house compound library by using phenotypic screening. Following medicinal  
20  
21  
22 chemistry optimization and SAR studies revealed compound **D11** as the most potent  
23  
24  
25 derivative in this series that altered macrophages M2 polarization, together with excellent  
26  
27  
28 oral bioavailability and therapeutic effects in a mural EAE model. It was also found that  
29  
30  
31 compound **D11** was able to distort the polarization of macrophages towards M2 *in vivo*,  
32  
33  
34 and M2 polarization macrophages functioned through inhibiting T-cell proliferation.  
35  
36  
37 According to gene chip and western blot studies, Stat3 and Akt proteins were identified  
38  
39  
40 to be the main targets that contributed to the biological effects induced by the treatment  
41  
42  
43 of compound **D11** (**Scheme 4**). As previously reported, the PI3K/Akt signaling pathway  
44  
45  
46 plays a vital role in mediating the macrophages polarization,<sup>41-43</sup> and p-STAT3 is a strong  
47  
48  
49 transcription factor of many M2-related genes.<sup>36</sup> Whereas we only proved that Akt and  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3  
4 Stat3 phosphorylation are involved in **D11** promoting macrophage M2 polarization, further  
5  
6  
7 study is needed to investigate the synergistic role of Akt and Stat3 in macrophages M2  
8  
9  
10 polarization. Our study not only demonstrated a promising approach for the discovery of  
11  
12  
13 novel macrophage M2 modulators for the treatment of MS but also provided a new  
14  
15  
16 strategy for phenotypic screening of modulators that could alter cells in different states.  
17  
18  
19  
20  
21 Compound **D11** identified in this study may be taken as a promising starting point for the  
22  
23  
24 development of small molecule therapeutics to treat MS.  
25  
26  
27  
28  
29  
30  
31

32  
33  
34  
35  
36  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46 **Scheme 4.** Schematic representation of **D11**-mediated M2 polarization and  
47  
48  
49 neuroprotective effect. **D11** is uptaken by macrophages and promotes macrophages M2  
50  
51  
52 polarization by activating Akt and Stat3. Phosphorylated Stat3 translocated into the  
53  
54  
55  
56  
57  
58  
59  
60

nucleus encoding M2 macrophages related genes such as *Mrc1*(CD206), *Arg1* and *Fizz1*.

D11-treated macrophages inhibit CD4+ T cells proliferation, therefore reduce the inflammatory reaction generated by autoreactive Th1 and Th17 cells, finally inhibits demyelination and prevents of EAE.

#### 4. Experimental Section

##### Chemistry

<sup>1</sup>H NMR and <sup>13</sup>C NMR spectra were recorded at 500 MHz using a Bruker AVANCE III spectrometer in CDCl<sub>3</sub>, or DMSO-d<sub>6</sub> solution, with tetramethylsilane (TMS) serving as the internal standard. Chemical shift values (δ) were reported in ppm. Multiplicities are recorded by the following abbreviations: s, singlet; d, double; t, triplet; q, quartet; m, multiplet; J, coupling constant (Hz). High-resolution mass spectrum (HRMS) were obtained from Agilent Technologies 6224 TOF LC/MS. The purities of compounds for biological testing were assessed by NMR and HPLC, and the purities were ≥95 %. The analytical HPLC was performed on an Agilent 1260 Infinity II (LC03) machine and a C18 reversed-phase column (Agilent Eclipse XDB-C18, 4.6\*250 mm, 5 μm), with a flow rate

1  
2  
3 of 1.0 mL/min, the detection by UV absorbance at a wavelength of 254 nm, the column  
4  
5  
6  
7 temperature was 25 °C, eluting with water (0.1% trifluoroacetic acid) as A phase and  
8  
9  
10 methanol as B phase (0 min, A phase: 90%, B phase: 10%; 8 min, A phase: 10%, B phase:  
11

60

1  
2  
3 **General procedure B:** (for the synthesis of compounds **3a**, **3c**, **6b**, **6c**, **9a-d**, **9g**, **9h**, **9j**)  
4  
5

6  
7 To a solution of biaryl ester (10mmol) in dry THF/DMF (v/v, 10: 1) at 0 °C was added NCS  
8  
9  
10 (1.46 g, 11 mmol) in one portion. The reaction mixture was stirred at r.t. for 5 h. After it  
11  
12  
13 was fully reacted, the mixture was poured into H<sub>2</sub>O (50 mL) and extracted with ethyl  
14  
15 acetate (30 mL × 3). The combined organic layers were washed with saturated brine (50  
16  
17 mL × 2), dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated under vacuum. The residue was purified  
18  
19  
20  
21 by column chromatography.  
22  
23  
24  
25

26  
27  
28 To a solution of the above intermediate products (8.8 mmol) in dry THF/EtOH (v/v, 4:  
29  
30  
31 1) was slowly added aqueous NaOH (3 N, 10 mL, 30 mmol) and the mixture was stirred  
32  
33  
34 at r.t. for 5 h. After it was fully reacted, the solvent was removed under vacuum and the  
35  
36  
37 resulting crude mixture was dissolved in H<sub>2</sub>O (30 mL) and acidified with 1 N hydrochloric  
38  
39  
40 acid until pH 2~3, and extracted with ethyl acetate (30 mL × 3). The combined organic  
41  
42  
43 layers were washed with saturated brine, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, and then  
44  
45  
46 concentrated to dryness under vacuum to provide the white solid.  
47  
48  
49  
50

51  
52 **General procedure C:** (for the synthesis of compounds **3b**, **6a**, **9e**, **9f**, **9i**) To a solution  
53  
54  
55 of biaryl ester (2.2g, 8.8mmol) in the mixture of tetrahydrofuran and ethanol (v/v = 4:1,  
56  
57  
58  
59  
60

1  
2  
3 30mL), aqueous NaOH (3N, 10mL, 30mmol) was slowly added. The mixture was stirred  
4  
5  
6  
7 at r.t. for 5h. The mixture was then concentrated under reduced pressure, the residue  
8  
9  
10 was resolved in water (30 mL) and acidified with 1 N hydrochloric acid until pH 2 ~ 3 and  
11  
12  
13 extracted with ethyl acetate (30 mL × 3). The combined organic layers were washed with  
14  
15  
16 saturated brine, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, and dried under vacuum to afford the  
17  
18  
19 white solid.  
20  
21  
22  
23

24 **General procedure D:** (for the synthesis of compounds **12a-d**) To a solution of  
25  
26  
27 compound **11** (*tert*-butyl-(2-nitroethyl) carbamate, 285 mg, 1.5 mmol), (2S) or (2R)-2-  
28  
29 (diphenyl((trimethylsilyl)oxy)methyl) pyrrolidine (33 mg, 0.1 mmol) and benzoic acid (25  
30  
31 mg, 0.2 mmol) in dry dichloromethane (2 mL) was slowly added substituted cinnamyl  
32  
33  
34 aldehyde (1 mmol) at 0 °C. After the addition was complete, the reaction was warmed up  
35  
36  
37 to room temperature and stirred overnight. The stirring was continued until aldehyde was  
38  
39  
40 consumed (monitored by TLC). The solution was diluted to 10 mL with dichloromethane  
41  
42  
43 and trifluoroacetic acid (148 μL, 2 mmol) was added dropwise, then the reaction mixture  
44  
45  
46 was stirred for another 5 h. The reaction was quenched by the dropping of 1N aqueous  
47  
48  
49 sodium bicarbonate solution (10 mL) and stirred for another 10 min. Water phase was  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 extracted with ethyl acetate (10 mL × 3), and the combined organic layers were washed  
4  
5  
6  
7 with saturated brine (20 mL × 2) dried over anhydrous sodium sulfate and concentrated.  
8  
9

10 Purification by flash column chromatography afforded yellow solid.  
11  
12  
13

14 **General procedure E:** (for the synthesis of compounds **13a-d**) To a solution of 3,4-  
15  
16  
17 disubstituted piperidine compound (5.4 mmol), triethylsilane (1.8 mL, 11 mmol) in  
18  
19  
20 dichloromethane (25 mL) was added dropwise trifluoroacetic acid (3.7 mL, 50 mmol) at 0  
21  
22  
23 °C. After the addition was complete, the reaction was warmed up to room temperature  
24  
25  
26  
27 and stirred overnight. Then the reaction was quenched by the dropping of saturated  
28  
29  
30 aqueous sodium bicarbonate (50 mL) and stirred for another 10 min. Water phase was  
31  
32  
33 extracted with dichloromethane (20 mL × 3), and the combined organic layers were  
34  
35  
36 washed with saturated brine (20 mL × 2) dried over anhydrous sodium sulfate and  
37  
38  
39 concentrated in vacuo to give an oil. To a suspension of the residue and triethylamine  
40  
41  
42 (1.4 mL, 10 mmol) in tetrahydrofuran (45 mL), di-*tert*-butyl dicarbonate (3.7 mL, 50 mmol)  
43  
44  
45 was added in batches at 0 °C. After the addition was complete, the reaction was warmed  
46  
47  
48  
49 up to room temperature and stirred for 5 h. After solvent removal, the residue was  
50  
51  
52  
53 dissolved in ethyl acetate (50 mL), washed by 0.5N hydrochloric acid (20 mL × 2) and  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 saturated brine (20 mL × 2) and dried over anhydrous sodium sulphate. After solvent  
4  
5  
6  
7 removal, the residue was purified by column chromatography to afford the product as a  
8  
9  
10 white solid.

11  
12  
13  
14 **General procedure F:** (for the synthesis of compounds **14a-d**) To a suspension of 3,4-  
15  
16  
17 disubstituted piperidine compound (4.2 mmol) in ethyl alcohol - water (v/v, 3: 1, 40mL)  
18  
19  
20 was added iron powder (2.82 g, 50.4 mmol) and ammonium chloride (1.0 g, 16.8 mmol),  
21  
22  
23  
24 then the mixture was refluxed for 5 h with mechanical stirring. After it is fully reacted, the  
25  
26  
27  
28 mixture was filtered and filtrate was concentrated under vacuum. The residue was  
29  
30  
31 dissolved in ethyl acetate (50 mL), washed by saturated aqueous sodium bicarbonate (20  
32  
33  
34 mL × 2) and saturated brine (20 mL × 2) and dried over anhydrous sodium sulphate. After  
35  
36  
37  
38 solvent removal, the residue was dried in vacuum to give gray solid.

39  
40  
41  
42 **General procedure G:** To a suspension of the acid (0.2 mmol), EDCI (69 mg, 0.36  
43  
44  
45 mmol), HOBT (49 mg, 0.36 mmol) and DIPEA (87 μL, 0.5 mmol) in dichloromethane was  
46  
47  
48 added the amine (58.8 mg, 0.2 mmol), then the mixture was reacted for 5 h at room  
49  
50  
51  
52 temperature with mechanical stirring. After it was fully reacted, the mixture was  
53  
54  
55  
56 concentrated under vacuum. The residue was dissolved in ethyl acetate (50 mL), washed  
57  
58  
59  
60

1  
2  
3  
4 by 1N HCl (20 mL × 2) and saturated brine (20 mL × 2) and dried over anhydrous sodium  
5  
6  
7 sulphate. After solvent removal, the residue was purified by column chromatography to  
8  
9  
10 afford the product as light-yellow solid (for the synthesis of compounds **C7-C10**).

11  
12  
13  
14 To a solution of the above yellow solid in ethyl acetate was added HCl saturated ethyl  
15  
16  
17 acetate, stirred at room temperature for 6 h. After it was fully reacted, the mixture was  
18  
19  
20 filtered, the resulted solid was washed with diethyl ether. The solid was dried in vacuum  
21  
22  
23 to afford target product as white solid (for the synthesis of compounds **B1, C1-C6, C11,**  
24  
25  
26  
27 **D1-D19**).

28  
29  
30  
31 To a solution of above-resulted hydrochloride product in MeOH was added L-tartaric  
32  
33  
34 acid, stirred in room temperature for 2 h. After the solvent removal, the residue was  
35  
36  
37 washed with diethyl ether, dried in vacuum to afford white solid (for the synthesis of  
38  
39  
40 compounds **D20, D21**).

41  
42  
43  
44  
45 After the SAR study, 33 compounds were obtained in total, the compound information  
46  
47  
48 of of the target compounds and the intermediates can be found in the following part.

#### 49 50 51 52 **Methyl 3-methyl-5-(1-methyl-1H-pyrazol-5-yl)picolinate (2a)**

53  
54  
55  
56 General procedure A, yield: 94%; ESI-MS:  $m/z = 232$  [M + H]<sup>+</sup>.

**Methyl 5-(1-methyl-1H-pyrazol-5-yl)picolinate (2b)**

General procedure A, yield: 66%;  $^1\text{H NMR}$  (500 MHz,  $\text{CDCl}_3$ )  $\delta$  8.83 (dd,  $J = 2.2, 0.7$  Hz, 1H), 8.23 (dd,  $J = 8.1, 0.7$  Hz, 1H), 7.91 (dd,  $J = 8.1, 2.2$  Hz, 1H), 7.56 (d,  $J = 2.2$  Hz, 1H), 6.45 (d,  $J = 2.2$  Hz, 1H), 4.04 (s, 3H), 3.94 (s, 3H). ESI-MS:  $m/z = 218$   $[\text{M} + \text{H}]^+$ .

**5-(4-Bromo-1-methyl-1H-pyrazol-5-yl)-3-methylpicolinic acid (3a)**

General procedure B, yield: 87%;  $^1\text{H NMR}$  (500 MHz,  $\text{DMSO}-d_6$ )  $\delta$  8.56 (s, 1H), 7.94 (s, 1H), 7.73 (s, 1H), 3.82 (s, 3H), 2.51 (s, 3H). ESI-MS:  $m/z = 294$   $[\text{M} - \text{H}]^-$ .

**3-Methyl-5-(1-methyl-1H-pyrazol-5-yl)picolinic acid (3b)**

2  
3 **Drug Screening.** RAW264.7 and BMDMs were plated in six-well plates and incubated  
4  
5  
6  
7 at 37°C in 5% CO<sub>2</sub>. To evaluate the effect of compounds on promoting macrophages M2  
8  
9  
10 polarization. Cells were treated with 300 nM compounds or 20 ng/ml IL-4 (used as a  
11  
12  
13 positive control to promote M2 polarization, Peprotech) for 24 h. Macrophages M2  
14  
15  
16 polarization was determined by measuring *Arg1*, *Mrc1*, *Fizz1* mRNA level. To evaluate  
17  
18  
19 the effect of compounds on inhibiting macrophages M1 polarization. Cells were pre-  
20  
21  
22 incubated 50 ng/ml LPS for 24h to induce M1 polarization, then treated with 300 nM  
23  
24  
25 compounds for 24 h. Macrophages M1 polarization was determined by measuring *Mcp1*,  
26  
27  
28  
29  
30  
31 *Inos*, *Tnf-α* mRNA level.  
32  
33

34  
35 **qRT-PCR.** Total RNA was extracted using Trizol (Invitrogen) according to  
36  
37  
38 manufacturer's procedures. cDNA synthesis was performed using "TransScript One-Step  
39  
40  
41 gDNA Removal and cDNA Synthesis SuperMix" kit (Transgen). qRT-PCR was carried out  
42  
43  
44 using Applied Biosystems Fast 7500 Real-time PCR instrument with SYBR Premix Ex  
45  
46  
47 Taq™ (TAKARA). Primers used are listed in **Table S4**. The results were normalized to

3 Complete Freund's Adjuvant (Sigma) containing 4 mg/ml heat-killed Mycobacterium  
4 tuberculosis (strain H37Ra, BD Biosciences). Then, the mixture was injected  
5  
6 subcutaneously into neck (0.1 ml) and both hindlegs (0.05 ml each) of mice. 200 ng  
7  
8 Pertussis toxin (List Biological Lab, Inc) was administered intravenously on day 0 and 1  
9  
10 post immunization. Clinical score and body weight were recorded daily. Clinical scoring  
11  
12 system: 0 = healthy; 0.5 = limp tail tip; 1 = limp tail; 1.5 = waddling gait with partial tail  
13  
14 weakness; 2 = partial hind limb paralysis; 2.5 = unilateral complete hind limb paralysis; 3  
15  
16 = complete bilateral hind limb paralysis; 3.5 = complete hind limb paralysis and partial  
17  
18 forelimb paralysis; 4 = tetraplegia; 4.5 = moribund; 5 = death.<sup>45, 46</sup> To determine the  
19  
20 therapeutic effect of **D11** on EAE mice, all the compounds were dissolved in saline, 100  
21  
22 mg/kg **D11**, 200 mg/kg **D11**, 10 mg/kg Dexamethasone (DXM) or vehicle (saline) was  
23  
24 intraperitoneally administrated daily from day 7 post immunization.  
25  
26  
27  
28  
29

39  
40  
41  
42  
43  
44

45 **Isolation of Mononuclear Cells.** Spleens and dLNs from vehicle or **D11**-treated EAE  
46  
47 mice were homogenized in gentleMACS Dissociator (Miltenyi Biotec) to obtain single-cell  
48  
49 suspensions. Brains and spinal cords (CNS) from vehicle or **D11**-treated EAE mice were  
50  
51 dissected and digested with Collagenase Type IV (Gibco) and separated on  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 discontinuous 70%/30% Percoll gradients, centrifuged for 30 min at 500×g, 18 °C. The  
4  
5  
6  
7 interphase was diluted by transferring to a clean conical tube containing HBSS, then  
8  
9  
10 centrifuged for 5 min at 500×g and 18 °C. Mononuclear cells were collected for further  
11  
12  
13  
14 FACS analysis.  
15  
16

17 **Flow Cytometry.** For cell surface markers staining, cells were incubated with  
18  
19  
20 Fluorochrome-labeled antibodies against CD4, CD11b, CD11c, MHC-II (all from BD  
21  
22  
23 Biosciences), F4/80, CD86, CD206 (MMR) (all from Biolegend). For intracellular cytokine  
24  
25  
26 staining, single cell suspensions from spleens, dLNs and CNS were re-stimulated with 2  
27  
28  
29

57  
58  
59  
60  
Cells were analyzed by BD FACScaliber flow cytometer. The fluorescence intensity was  
analyzed by Cell Quest Software.

1  
2  
3 **Histological Analysis.** Vehicle or D11-treated EAE mice were fixed in 4%  
4  
5  
6  
7 paraformaldehyde (PFA) immediately after perfusion with PBS and spinal cords were  
8  
9  
10 isolated. For Luxol Fast Blue (LFB) staining, fresh spinal cords were embedded in OCT  
11  
12  
13 (Tissue-Tek) and frozen at -80°C. The frozen sections were immersed for 3 h in 0.1%  
14  
15  
16 Luxol Fast Blue solution (Solvent Blue 38, Sigma-Aldrich) at 56-60°C. The sections were  
17  
18  
19 rinsed in deionized water and differentiation was initiated in 0.05% aqueous lithium  
20  
21  
22 carbonate for 10~12 s, followed by termination in multiple immersions in fresh 70%  
23  
24  
25 ethanol until gray and white matter could be distinguished. After washed in deionized  
26  
27  
28 water, sections were dehydrated in 80% ethanol (1 min), 95% ethanol (2×1 min), 100%  
29  
30  
31 ethanol (3 min) and xylene, finally coverslipped. For hematoxylin-eosin (H&E) staining,  
32  
33  
34 fresh spinal cords were embedded in paraffin. Paraffin-embedded sections were stained  
35  
36  
37 with H&E by Leica ST5010 to estimate inflammation in CNS. Images were acquired using  
38  
39  
40 Zeiss LSM510 Meta fluorescence confocal microscope or Leica DM2500 microscope.  
41  
42  
43  
44  
45  
46  
47  
48

49 **Suppression Assays.** To evaluate the suppressive capacity of macrophages, BMDMs  
50  
51  
52 were treated with 300 nM D11 in combination with 50 ng/ml LPS (used to promote M1  
53  
54  
55 polarization) or 10 ng/ml IL-4 (used to promote M2 polarization) for 48 h on day 5 of  
56  
57  
58  
59  
60

1  
2  
3 differentiation, drugs were removed on day 7. Naïve CD4<sup>+</sup> T cells were negatively  
4  
5  
6  
7 selected using EasySep Mouse Naïve CD4<sup>+</sup> T cells Isolation kit (STEMCELL  
8  
9  
10 Technologies Inc) then labeled with carboxyfluorescein succinimidyl ester (CFSE)  
11  
12  
13 (Biolegend). BMDMs were cocultured with CFSE-labeled naïve CD4<sup>+</sup> T cells in the  
14  
15  
16 presence of 500 ng/ml anti-CD3 mAb and 500 ng/ml anti-CD28 mAb (Biolegend) at a ratio  
17  
18  
19 of 1:1. After 72h, proliferation of CD4<sup>+</sup> T cells was determined by FACS.  
20  
21  
22

23  
24 **Statistical Analysis.** Independent experiments were carried out at least three times.  
25  
26  
27 Data was shown as mean  $\pm$  S.E.M in the graphs. Results were analyzed using unpaired  
28  
29  
30 two-tailed student's t test or One-Way ANOVA.  
31  
32  
33

34  
35 **Microarray analysis.** Total RNA were amplified, labeled and purified by using  
36  
37  
38 GeneChip® 3' IVT PLUS Reagent Kit (Cat#902416, Affymetrix, Santa Clara, CA, US) /  
39  
40  
41 Ovation FFPE WTA System (Cat#3403, NuGEN, San Carlos, CA, US) / Ovation® Pico  
42  
43  
44 WTA System V2(Cat#3302, NuGEN, San Carlos, CA, US)and FL-Ovation™ cDNA Biotin  
45  
46  
47 Module V2(Cat#4200, NuGEN, San Carlos, CA, US) followed the manufacturer's  
48  
49  
50  
51  
52 instructions to obtain biotin labeled cRNA.  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3  
4       Array hybridization and wash was performed using GeneChip® Hybridization, Wash  
5  
6  
7       and Stain Kit (Cat#900720, Affymetrix, Santa Clara, CA, US) in Hybridization Oven 645  
8  
9  
10       (Cat#00-0331-220V, Affymetrix, Santa Clara, CA, US) and Fluidics Station 450 (Cat#00-  
11  
12  
13  
14       0079, Affymetrix, Santa Clara, CA, US) followed the manufacturer's instructions.

15  
16  
17       Slides were scanned by GeneChip® Scanner 3000 (Cat#00-00212, Affymetrix, Santa  
18  
19  
20       Clara, CA, US) and Command Console Software 4.0 (Affymetrix, Santa Clara, CA, US)  
21  
22  
23  
24       with default settings. Raw data were normalized by MAS 5.0/RMA algorithm, Affy  
25  
26  
27  
28       packages in R.

29  
30  
31       **Western blotting and ELISA.** BMDMs were lysed in buffer (PH= 7.6) containing 1%  
32  
33  
34       Triton X-100, 1% phosphatase inhibitor, 1mM PMSF. Protein extracts were  
35  
36  
37  
38       electrophoresed by S.D.S-PAGE and transferred to PVDF membrane and probed with  
39  
40  
41  
42       primary antibodies. The primary anti-bodies were as follows: anti-AKT, anti-p-AKT(308),  
43  
44  
45       anti-p-AKT(473), anti-Arg-1, anti-Ym1, anti-TNF- $\alpha$ , anti-STAT3, anti-p-STAT3(705), anti-  
46  
47  
48       STAT6, anti-p-STAT6 (all purchased from Cell Signaling Technology). Appropriate  
49  
50  
51  
52       secondary antibodies and ECL were performed to visualize the protein signaling. GAPDH  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 was used as a loading control. IFN- $\gamma$  and IL-17A concentration in cell culture supernatants  
4  
5  
6  
7 were determined by ELISA kit (DAKEWE).  
8  
9
