**General:** All non-aqueous reactions were run under an inert atmosphere (nitrogen or argon) using standard techniques for manipulating air-sensitive compounds.<sup>1</sup> Anhydrous solvents were obtained either by filtration through drying columns (THF, ether, CH<sub>2</sub>Cl<sub>2</sub>, benzene, DMF, CH<sub>3</sub>CN, toluene, hexane, methanol). Analytical thin-layer chromatography (TLC) was performed on precoated, glass-backed silica gel. Visualization of the developed chromatogram was performed by UV absorbance, aqueous cerium molybdate, or aqueous potassium permanganate. Flash column chromatography was performed using 230-400 mesh silica of the indicated solvent system according to standard technique.<sup>2</sup> Melting points were obtained on a melting point apparatus and are uncorrected. Infrared spectra were taken on a FTIR apparatus and are reported in reciprocal centimeters (cm<sup>-1</sup>). Nuclear magnetic resonance spectra (<sup>1</sup>H, <sup>13</sup>C, DEPT 135, COSY, HMQC, NOESY) were recorded either on a 300 or 400 MHz spectrometer. Chemical shifts for <sup>1</sup>H NMR spectra are recorded in parts per million from tetramethylsilane with the solvent resonance as the internal standard (chloroform, δ 7.27 ppm). Data are reported as follows: chemical shift, multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, qn = quintet, m = multiplet and br = broad), coupling constant in Hz, integration. Chemical shifts for <sup>13</sup>C NMR spectra are recorded in parts per million from tetramethylsilane using the central peak of deuteriochloroform (77.00 ppm) as the internal standard. All spectra were obtained with complete proton decoupling. When ambiguous, proton and carbon assignments were established using COSY, HMQC and DEPT experiments.

**Reagents:** Unless otherwise stated, commercial reagents were used without purification. PhI(OAc)<sub>2</sub>, malonate esters, alkenes, Rh<sub>2</sub>(OAc)<sub>4</sub>, Rh<sub>2</sub>(esp)<sub>2</sub>, (CuOTf)<sub>2</sub>•C<sub>6</sub>H<sub>6</sub> were commercially available. PhI=O was synthesized according to a previously reported procedure.<sup>3</sup> Diazomethyl malonate (**1h**) and diazodiisopropyl malonate (**1i**) were synthesized according to a previously reported procedure.<sup>4</sup>

### Synthesis of Bis(methoxycarbonyl)(phenyliodinio)methanide (**1f**)

In a 50-mL flask under argon were added KOH (2.00 g, 36.0 mmol), MeCN (20 mL) and dimethyl malonate (693 μL, 6.00 mmol). The heterogeneous mixture was cooled at 0 °C (ice/water bath) and was stirred vigorously for 5 min to produce a milky white suspension. PhI(OAc)<sub>2</sub> (2.13 g, 6.60 mmol) was then added in one portion and the reaction mixture was stirred vigorously for 2.0 h at 0 °C. The reaction mixture gradually became a thick creamy mixture. Water (10 mL) was then added and the mixture was stirred for 1 min. The beige/yellow biphasic solution containing a fluffy white suspension was filtered. The solid was washed with water (2 x 5 mL). It is important that the solvent be completely removed between each wash. The solid was finally washed with Et<sub>2</sub>O (10 mL) then dried under high vacuum to yield **1f** as an off-white solid (1.56 g, 78%): mp 100 °C (decomposition); <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>) δ 7.77-7.72 (m, 2H), 7.56-7.50 (m, 1H), 7.44-7.37 (m, 2H), 3.74 (s, 6H); <sup>13</sup>C NMR (75 MHz, CDCl<sub>3</sub>) δ 166.3 (2), 131.6 (2), 131.5 (2), 131.3, 114.3, 52.4 (2); IR (neat) 3081, 2982, 2948, 2899, 1668, 1585, 1575, 1562, 1435, 1425, 1320, 1060, 990 cm<sup>-1</sup>; Anal. calcd for C<sub>11</sub>H<sub>11</sub>IO<sub>4</sub>: C, 39.54; H, 3.35; found: C, 39.05; H, 3.34. The spectral data were consistent with that previously reported.<sup>5</sup> The product partially degraded during the preparation of the NMR sample.

### General procedure for the synthesis of iodonium ylides:

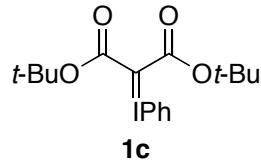

In a 100 mL flask under argon were added KOH (2.00 g, 36.0 mmol), CH<sub>2</sub>Cl<sub>2</sub> (20 mL) and the malonate (7.20 mmol). The heterogeneous mixture was put in a room temperature water bath (20 °C) and was stirred vigorously for 5 min to produce a milky white suspension. PhI(OAc)<sub>2</sub> (1.93 g, 6.00 mmol) was then added in one portion and the reaction mixture was stirred vigorously for 2.0 h at room temperature. The reaction mixture gradually became yellow. The heterogeneous mixture was then filtered on a cotton plug and the flask was washed five times with CH<sub>2</sub>Cl<sub>2</sub> (5 mL). The yellow solution was then concentrated under reduced pressure at room temperature (20 °C) and then put under high vacuum for 1 h.
