Just Accepted

"Just Accepted" manuscripts have been peer-reviewed and accepted for publication. They are posted online prior to technical editing, formatting for publication and author proofing. The American Chemical Society provides "Just Accepted" as a free service to the research community to expedite the dissemination of scientific material as soon as possible after acceptance. "Just Accepted" manuscripts appear in full in PDF format accompanied by an HTML abstract. "Just Accepted" manuscripts have been fully peer reviewed, but should not be considered the official version of record. They are accessible to all readers and citable by the Digital Object Identifier (DOI®). "Just Accepted" is an optional service offered to authors. Therefore, the "Just Accepted" Web site may not include all articles that will be published in the journal. After a manuscript is technically edited and formatted, it will be removed from the "Just Accepted" Web site and published as an ASAP article. Note that technical editing may introduce minor changes to the manuscript text and/or graphics which could affect content, and all legal disclaimers and ethical guidelines that apply to the journal pertain. ACS cannot be held responsible for errors or consequences arising from the use of information contained in these "Just Accepted" manuscripts.

ABSTRACT

An efficient method for the asymmetric Diels-Alder cycloaddition of 2'-hydroxychalcones with acyclic or cyclic dienes has been successfully developed. The Diels-Alder cycloaddition is mediated by a chiral boron complex with VANOL, affording the corresponding products in high yields and with excellent diastereo- and enantio-selectivities. This reaction enabled the enantioselective construction of cyclohexene skeletons crucial for the total synthesis of a number of Diels-Alder type natural products (-)-nicolaioidesin C, (-)-panduratine A, (-)-kuwanon I, (+)-kuwanon J, (-)-brosimones A and B.

Numerous structurally related Diels-Alder products have been isolated from various Moraceous and related plants, ¹ such as the chalconoid natural products, nicolaiodesin C $(1)^2$ and panduratin A $(2)^3$; prenylflavonoid Diels-Alder natural products, kuwanon I $(3)^4$ and J $(4)^5$, brosimone A $(5)^6$ and B $(6)^7$; as well as kuwanons G $(7)^8$ and H $(8)^9$ (Fig. 1). These molecules all possess a cyclohexene ring derived from Diels-Alder cycloaddition of a 2'-hydroxychalcone-containing dienophile. However, structural variations in the diene and dienophile precursors give rise to natural products which display striking diversity as well as significant biological activities.¹⁰ Accordingly, complex and biologically active Diels-Alder type natural products have attracted broad attention from the synthetic community over the past decade.¹¹ Several synthetic methods have been developed to promote Diels-Alder cycloadditions with 2'-hydroxychalcone dienophiles, including thermal promotion,¹² single-electron transfer initiation,¹³ as well as silica-supported silver nanoparticle (AgNPs) catalysis.¹⁴ However, all these methods are non-enantioselective. Palomo and co-workers have described the enantioselective total synthesis of (-)-nicolaioidesin C, using a chiral camphor auxiliary.¹⁵ In 2014, our group reported the first direct asymmetric Diels-Alder cycloaddition with 2'-hydroxychalcone dienophiles, using a chiral VANOL-boron Lewis acid complex.¹⁶ We demonstrated the application of our methodology to the synthesis of complex natural products (-)-kuwanon I, (+)-kuwanon J, (-)-brosimone A and (-)-brosimone B.¹⁶ In this paper, we report a full account of the development and optimization of the chiral boron-Lewis acid mediated Diels-Alder cycloaddition, a summary of our syntheses of the above natural products, and a report on the syntheses of two related natural products: (-)-nicolaioidesin C and (-)-panduratine A, using this methodology.

Figure 1. Representative Diels-Alder Type Natural Products Derived from 2'-Hydroxychalcones

Our studies began with the model reaction between 2'-hydroxychalcone 9 as dienophile and diene 10. Initially, we examined the effect of Brønsted acid catalysts, such as chiral BINOL-derived phosphoric acid (BA1),¹⁷ the more strong acidic catalyst *N*-Triflyl phosphoramide (BA2),¹⁸ (1*S*)-(+)-10-camphorsulfonic acid (BA3) and tartaric acid (BA4). Unfortunately, all of these attempts failed, including increasing amount of the catalyst (from catalytic to stoichiometric amount), raising complex temperature (from room temperature to reflux temperature) and extending reaction time, even promoted in microwave conditions, presumably because these Brønsted acids have insufficient efficiency (Table 1). We next turned our attention to chiral Lewis acid catalysts. 2'-Hydroxychalcones have been shown to be resistant to activation by several traditional Lewis acids, and chiral oxazaborolidine (LA1) and chiral aluminum Lewis acid complex (LA2) failed to catalyze this cycloaddition (Table 1, entry 3-4). Inspired by the enantioselective Diels-Alder reactions and chlorinations on the juglone systems,¹⁹ we selected the optically active BINOL-boron complex (LA3) to promote the asymmetric Diels-Alder

cycloaddition. To our delight, the chiral boron Lewis acid complex could effectively promote the cycloaddition of dienophile **9** and diene **10** to afford Diels-Alder adduct **11** (Table 1, entry 5). In this asymmetric Diels-Alder reaction, super-stoichiometric amount of the chiral boron complex was needed. When we reduced the amount of the chiral Lewis acid, yield and enantioselectivity of the cycloaddition adduct decreased (Table 1, entries 5 and 6). We suspected that the chiral ligand-dienophile intermediate may hydrolyze in the presence of water or open to the air, and indeed higher yields and moderate *ee* value could be regained at lower complex loading by addition of activated 5 Å molecular sieves (Table 1, entry 7).

^a Conditions: dienophile 9 (1 equiv), diene 10 (20 equiv), room temperature, isolated yield. ^b
^b Determined by chiral HPLC. ^c 80 °C, 100 W. ^d *R*-BINOL, 5 Å MS. THF = tetrahydrofuran, DCM
= dichloromethane, N.D. = not detected

Employing the same Diels-Alder reaction conditions as in table 1, entry 7, we screened a

number of different chiral ligands in order to optimize enantioselectivity (Table 2). We first considered whether sterically large BINOL substituent groups may improve enantioselectivity, but found that both the highly bulky chiral binaphthol ligand (L2)^{19a,c}, the chiral reduced-type binaphthol ligand (L3 and L4)²⁰ and (*R*, *R*)-TADDOL ligand (L5) result in relatively low enantioselectivity in our model reaction. Employing the vaulted 2,2'-binaphthol (VANOL, L6) and 3,3'-biphenanthrol (VAPOL, L7),²¹ developed by William D. Wulff and co-workers, 1.2 equiv complex loading was found to give the desired adducts with excellent yield and *ee* value. Although stoichiometric amount of the chiral boron complex is still required, the chiral ligands can be recycled repeatedly; both yield and *ee* value are retained after one and two recycles using the recovered chiral ligand VANOL in the asymmetric Diels-Alder reaction (Table 2, entries 7-9).

Table 2. Screening the Chiral Ligand

^{*a*} Conditions: Chiral ligand (2 equiv), BH₃.THF (2 equiv), AcOH (2 equiv), dienophile **9** (1 equiv), diene **10** (20 equiv), 5 Å MS, isolated yield. ^{*b*} Determined by chiral HPLC. ^{*c*}L6 (1.2 equiv). ^{*d*} With recycled ligand, one cycle, 99% recovery L6. ^{*e*} With recycled ligand, two cycles, 97% recovery L6.

To determine the substrate generality and limitations of this strategy, several dienes were subjected to asymmetric Diels-Alder reaction under the optimized conditions (Table 3). All the substituted dienes were converted to the corresponding adducts in satisfactory yield with high *ee* value. Single regioisomers was observed for unsymmetrical 2-substituted and 1,3-disubstituted dienes, and the *endo/exo* diastereoselectivity for diene **18** was 5.4:1 (Table 3, entries 1, 5 and 6).

 Table 3. Diels-Alder of Dienophile 9 and Dienes

product. ^b Determined by chiral HPLC. ^c *R*-VAPOL (1.2 equiv). ^d Single *endo* isomer. ^e Single regioisomer isomer.

To explain the excellent enantioselectivity observed in the [4+2]-Diels-Alder cycloaddition, we propose an assembly involving 2'-hydroxychalcone and a chiral boron-VANOL complex (Figure 2). A calculated model by Chem3D indicates that upon activation of the ketone moiety by the boron Lewis acid, the chiral VANOL ligand is probably forms $a_{\pi}\pi$ stacking interaction with the chalcone dienophile, which shields the α -face and dictates the stereofacial approach of the diene from the less hindered β -face.

Figure 2 Proposed Mechanism for the Enantioselective Diels-Alder Reaction and structure of the chiral VANOL-boron Lewis acid-dienophile complex

Encouraged by the effective asymmetric Diels-Alder reaction with a wide variety of substrates, we decided to apply our strategy to the total syntheses of (-)-nicolaiodesin C and (-)-panduratin A. Chalcone **23** and myrcene were mixed under the optimal reaction conditions, and then the acetyl group was removed to afford (-)-nicolaiodesin C (**1**) with 96% *ee*. (-)-Panduratin A was obtained from the same reaction sequence, starting from Diels-Alder cycloaddition of 1:3 *E:Z* ocimene (*E*, *Z*)-ocimene²² with chalcone **23** to give the target molecule in 56% yield and 87% *ee* (Scheme 1). When pure *Z*-ocimene reacted with the dienophile, no Diels-Alder adduct was isolated.^{12c} The lower yield of the Diels-Alder step was probably due to the fact that the requisite *E*-ocimene has

been found to undergo olefin isomerization and polymerization under acid conditions.²³

Scheme 1. Total Syntheses of (-)-Nicolaiodesin C and (-)-Panduratin A

Reagents and conditions: (1) a) *R*-VANOL (1.2 equiv), AcOH (1.2 equiv), BH₃.THF (1.2 equiv); b) Dienophile **23**, 5 Å MS, THF, rt, 1 h; c) Myrcene, rt, 16 h, 88%. (2) a) *S*-VANOL (2.0 equiv), AcOH (2.0 equiv), BH₃.THF (2.0 equiv). b) Dienophile **23**, 5 Å MS, THF, rt, 1 h. c) Ocimene (*E*:*Z* = 1:3), rt, 68 h, 57%.

Encouraged by the successful total syntheses of (-)-nicolaiodesin C and (-)-panduratin A, we then sought to explore the total syntheses of the more complex natural products, (-)-kuwanon I and (+)-J, (-)-brosimone A and B. We strived to access all of the four natural products from the common intermediate **24**, which can undergo signatropic rearrangement to form *ortho*-prenylated chalcone **25**, a synthetic precursor for kuwanons I and J, or *para*-prenylated chalcone **26** for brosimones A and B (Scheme 2).

The important research work reported by Nomura and co-workers showing the chalcone (**M-1**) was transformed to the methylated kuwanon J (**M-3**) upon treatment with the *M. alba* cell cultures (Scheme 3).²⁴ The findings indicated that kuwanon J might be biosynthesized by dehydrogenase and Diels-Alderase. Inspired by this elegant biosynthesis study, we envisioned a synthetic route which could effectively mimic the required transformations catalyzed by dehydrogenase and Diels-Alderase in nature.

Our synthetic approach to kuwanons I and J began with preparation of the dienophile. Initially, prenylation of readily available chalcone **27** under standard conditions afforded *O*-prenyl chalcone **24**, which was subjected to a montmorillonite K-10 catalyzed sigmatropic rearrangement to afford the desired chalcone **25** (37%) for kuwanons I and J, [1,5]-sigmatropic rearrangement product **26** (27%) for brosimones A and B, along with deprenylated chalcone **27** (36%) (Scheme 4). Scheme 4 In order to increase the reactivity of dienophile, we converted the MOM protecting groups into the more electron-withdrawing acetyl groups (35%, 2 steps).

Scheme 4. Synthesis of dieneophile 28

A permethylated *ortho*-prenylated chalcone **29** was selected as the synthetic precursor of diene **32** in order to increase the D-A reactivity of the diene. The key biomimetic dehydrogenation to generate **32** involved a regioselective Schenck ene reaction²⁵ of chalcone **29**, reduction and dehydration of tertiary allylic alcohol **31** to give the desired diene (Scheme 5).

With both dienophile **28** and diene **32** in hand, we began to evaluate the chiral boron complex catalysed-Diels-Alder cycloaddition (Scheme 6). We were pleased to find that the [4+2] cycloaddition between dienophile **28** and diene **32** proceeded smoothly under the optimal conditions to afford *endo/exo* diastereomers (**34** and **33**, respectively) in 75% yield with a 1.2:1 ratio. The completion of the syntheses of kuwanons I and J required only removal of the acetyl and methyl protection groups. Hydrolysis of the products **33** and **34** under basic conditions afforded the compound **35** and **36**. Unfortunately, many attempts at methyl group deprotection of either **35** or **36** led only to decomposition. We attempted to use other electron-donating protecting groups of the diene, such as MOM group, MTM group and TIPS group. Unfortunately, the late-stage global deprotection only led to incomplete deprotection or decomposition. This issue was resolved by converting the phenolic hydroxyl group to acetyl esters. Ultimately, the usage of acetyl protecting groups was an essential factor in completing total syntheses of kuwanons I and J, brosimones A and B (*vide infra*).

In order to complete the total synthesis of these natural products, we turned our attention to synthesis of acetyl group protected diene (Scheme 7). Initial *ortho*-prenylated chalcone **28** was subjected to the standard Schenck ene reaction conditions, followed by subsequent reduction with PPh₃ to afford the tertiary allylic alcohol **38** and secondary allylic alcohol **37** in 71% combined yield with a 2:1 ratio. The diene **39** was further prepared by dehydration of the tertiary allylic alcohol **38** in 75% yield. Unfortunately, several attempts for the dehydration of secondary allylic alcohol **37** failed due to low reactivity. Considering the fact that tertiary alcohols are typically better substrates for dehydration, we screened commonly used photosensitizers and solvents to improve the selectivity for the tertiary alcohol. We observed that a visible light-mediated²⁶ regioselective Schenck ene reaction using Ru(bpy)₃Cl₂·6H₂O as photosensitizer and MeOH as solvent significantly improved the ratio for tertiary alcohol (from 2:1 to 8:1). To the best of our knowledge, this biomimetic transformation represents the first Ru(bpy)₃Cl₂·6H₂O-mediated regioselective Schenck ene reaction.

We next turned our attention to synthesis of the para-prenylated chalcone diene, which was

 the synthetic precursor for brosimones A and B. It was found that a relatively good regio-selectivity for the Schenck ene-reduction of chalcone **40** was obtained by using tetraphenylporphyrin (TPP) as photosensitizer and MeOH as solvent. The tertiary allylic alcohol **42** and secondary allylic alcohol **41** were afforded in 63% combined yield with 3.2:1 ratio, respectively. The diene **43** was further prepared by dehydration of the tertiary allylic alcohol **42** in 68% yield (Scheme 7).

Scheme 7. Biomimetic Synthetic Design for Dienes

With both dienophile **28** and diene **39** in hand, we began to evaluate the key Diels-Alder cycloaddition catalyzed by chiral boron complex in total syntheses of kuwanons I and J (Scheme 8).We envisaged several challenges in the Diels-Alder step, due to the electron deficiency of acetyl protected diene **39** and the large steric size of both substrates. However, we were delighted to find that under the optimized reaction conditions, the Diels-Alder cycloaddition proceeded smoothly to afford *endo/exo* diastereomers (**45**:**44** = 1.2:1) in moderate yield and moderate enantiomeric excess (58% *ee* for **45**, 51% *ee* for **44**).²⁷ The non-eantioselective reaction, using

only BH₃·THF and AcOH yielded 12% of the Diels-Alder cycloadducts in the same reaction time. Therefore, we increased the ligand loading in order to reduce background reaction.²⁸ Increasing the equivalents of ligand from 1.2 to 2.5, resulted in an obvious improvement in enantioselectivity (97 % *ee* for **45**, 60 % *ee* for **44**). The best results for *exo*-product were obtained when *S*-8, 8'-dimethyl-VANOL (**L8**) was used as a chiral ligand. Finally, global deprotection of the Diels-Alder cycloadducts *exo*-**44** and *endo*-**45** under mild basic conditions efficiently furnished the desired natural products kuwanons I (**1**) and J (**2**), both in 70% yield. The ¹H and ¹³C NMR spectra of the synthetic kuwanons I and J were consistent with those reported for the natural products.^{4,5}

The *para*-prenylated chalcone **40** and diene **43** were utilized in the total synthesis of brosimone B (Scheme 9). To our surprise, both VANOL and VAPOL ligand can afford *endo* and *exo* diastereomers in good yields and excellent enantiomeric excess for both *endo* and *exo* products

The Journal of Organic Chemistry

(when S-VANOL as ligand, 98% ee for endo 46, 93% ee for exo 47). The structure of endodiastereomer 46 was confirmed by 2D-NMR. Final deprotection of the acetyl groups of exo-diastereomer 47 afforded brosimone B (5) in 70% yield.

Scheme 9. Synthesis of (-)-Brosimone B

The dimeric natural product, brosimone A is a structurally complex compound derived through the homodimerization of **43**, presumably *via* a remarkable tandem inter-/intramolecular asymmetric Diels-Alder cycloaddition process. To our knowledge, the sequential one-pot interand intramolecular Diels-Alder cycloaddition cascade was rarely described before.²⁹ Fortunately, when chiral boron complex was used, all three expected products were obtained, namely *endo-endo* **48** in 28% yield with 98% *ee*, *exo-endo* **49** in 20% yield (see below for *ee* value determination) and *exo-exo* **50** in 13% yield with 95% *ee* (entry 1). Finally, global deprotection of the *exo-exo* product **50** under mild basic conditions (K₂CO₃, MeOH) efficiently afforded brosimone A (**6**) in 70% yield. The ¹H and ¹³C NMR spectra of the synthetic brosimone A were in agreement with those reported for the natural product ⁶(Scheme 10).

The structures of the two natural products analogues *endo-endo* **48** and *exo-endo* **49** were confirmed by different methods (Scheme 11). Sequentially deacetylation and methylation of *endo-endo* **48**, the permethylation product **51** was obtained in 56% yield over 2 steps. The structure of the *endo-endo* **51** was unambiguously determined by X-ray crystallographic analysis. However, it proved not possible to directly measure the *ee* value of *exo-endo* **49** due to the presence of a mixture of conformational isomers in the chiral HPLC chromatogram. An indirect method was therefore devised, whereby **49** was converted to the known permethylated analogue **53**, previously reported by the Porco group.^{14c} Deprotection of the acetyl groups and methylation of *exo-endo* **49** afforded **53** in 49% yield over 2 steps. The NMR data for synthetic **53** fully matched with the compound obtained by permethylation of *exo-endo* hexamethyl ether. Unfortunately, the *ee* value of the *exo-endo* octamethyl ether **53** was only 31%.

CONCLUSIONS

An efficient method for the enantioselective Diels-Alder of 2'-hydroxychalcone and its derivatives has been developed, promoted by a chiral VANOL-boron Lewis acid complex. The cycloaddition proceeds smoothly at room temperature to provide the desired products in high yield and enantioselectivity. This methodology was applied to the enantioselective total syntheses of the prenylflavonoid Diels-Alder type natural products (-)-nicolaioidesin C, (-)-panduratine A, (-)-kuwanon I, (+)-kuwanon J, (-)-brosimone A and (-)-brosimone B. Key elements of the syntheses include the biosynthesis-inspired asymmetric Diels-Alder cycloaddition, as well as a biomimetic dehydrogenation reaction sequence for generation of the required diene precursor, involving regioselective Schenck ene reaction reduction and dehydration. Furthermore, a remarkable tandem inter-/intramolecular asymmetric Diels-Alder cycloaddition process was applied for the synthesis of brosimone A. Advances in the enantioselective synthesis of other

related complex natural products with important biological activities and further mechanistic studies are in progress.

EXPERIMENTAL SECTION

General procedure for the asymmetric Diels-Alder reaction:^{19a,c} Chiral ligand (1.2 equiv) was dissolved in anhydrous THF, then the solution was treated sequentially with $BH_3 \cdot THF$ (1.2 equiv) and glacial AcOH (1.2 equiv). The resulting mixture was stirred at rt (room temperature) for 30 min, concentrated to dryness and further dried under high vacuum at rt for 30 min. The colorless residue was dissolved in THF, then added the pre-activated 5Å molecular sieve (20 weight equiv) and dienophile (1.0 equiv), the resulting dark red solution was stirred at rt for 1 h before the diene (5.0 - 20 equiv) was added to the reaction mixture. The reaction was stirred at rt and monitored by TLC. Once completed, the mixture was quenched by addition of H_2O (15.0 equiv) and filtered through the celite, further washed with EtOAc, and the organic filtrates were collected and concentrated in vacuo. The residue was purified by flash column chromatography to afford the desired Diels-Alder cycloadducts and recovered chiral ligand, unless otherwise stated. The racemate Diels-Alder cycloadduct was prepared using the general procedure, employing the racemate BINOL or VANOL as the ligand.

Chalcone (9). To a stirred solution of 2'-hydroxyacetophenone (1.2 mL, 10 mmol) in MeOH (50 mL) was added benzaldehyde (1.0 mL, 10 mmol), followed by slow addition of a KOH aqueous solution (20 mol/L, 23 mL). The resulting orange solution was stirred at 40 °C for 3 days. The reaction mixture was diluted with saturated aqueous NH₄Cl, adjusted to pH 4 by adding 1 M HCl, extracted with EtOAc (50 mL \times 2), washed with brine, dried over Na₂SO₄ and concentrated in vacuo. The residue was purified by flash chromatography (ethyl acetate:petroleum ether = 1:5) to

afford the compound **9** (2.0 g, 90%) as a yellow solid. ¹H NMR (400 MHz, CDCl₃) δ 12.83 (s, 1H), 7.95-7.91 (m, 2H), 7.69-7.65 (m, 3H), 7.53-7.49 (m, 1H), 7.49-7.43 (m, 3H),7.05-7.03 (m, 1H), 6.98-6.93 (m, 1H). ¹³C NMR (100 MHz, CDCl₃) δ 193.7, 163.6, 145.5, 136.4, 134.6, 130.9, 129.6, 129.0, 128.6, 120.1, 120.0, 118.8, 118.6. The spectroscopic data for this compound were identical to those reported in the literature.³⁰

Chalcone (23). Diels-Alder cycloadducts (11/13/15/17/19/20/22/1). These known compound was prepared according to the reference.¹³

Compound (24/25/26/27/28/37/38/39/40/41/42/43). These known compounds were prepared according to the reference.¹⁶ Diels-Alder cycloadducts (44/45/46/47/48/49/50/51/52/53). The detail information of these known compounds see also reference 16.

Diels-Alder adduct (11). The general procedure was followed by employing *R*-VANOL (0.026mmol, 1.2 equiv), dienophile chalcone **9** (5 mg, 0.022 mmol, 1 equiv) and diene **10** (45 μ L, 20 equiv), the desired compound **11** (6.0 mg, 90%) was isolated as a light yellow solid and as a single regioisomer. 95.0% *ee* (isopropanol : hexane = 2:98), retention time 6.0 min and 6.8 min; $[\alpha]^{24}$ D+20.6 (c 0.91, DCM).

Diels-Alder adduct (13). The general procedure was followed by employing *R*-VANOL (25.8 mg, 0.0588 mmol, 1.2 equiv), dienophile chalcone **9** (11 mg, 0.049 mmol, 1 equiv) and diene **10** (131 μ L, 20 equiv), the desired compound **13** (15 mg, 99%) was isolated as a light yellow oil. 95.9% *ee* (isopropanol:hexane = 2:98), retention time 4.9 min and 5.3 min; [α]²³D +39.6 (c 0.84, DCM).

Diels-Alder adduct (15). The general procedure was followed by employing *R*-VANOL (0.073mmol, 1.2 equiv), dienophile chalcone **9** (0.06 mmol, 1 equiv) and diene **14** (71 mg, 5 equiv), the desired compound **15** (25.0 mg, 94%) was isolated as a light yellow solid. 96.5% *ee*

(isopropanol : hexane = 2:98), retention time 7.3 min and 8.6 min; $[\alpha]^{18}$ D 16.1 (c 0.86, DCM).

Diels-Alder adduct (17). The general procedure was followed by employing *R*-VANOL (0.25 mmol, 1.2 equiv), dienophile chalcone **9** (47 mg, 1 equiv), diene **16** (0.4 mL, 20 equiv), the desired compound **17** (57.3 mg, 90%) was isolated as a light yellow solid and as a single *endo*-isomer. 90.2% *ee* (isopropanol : hexane = 2:98), retention time 7.1 min and 8.9 min; $[\alpha]^{18}$ D 153 (c 0.23, DCM).

Diels-Alder adduct (19) and (20). The general procedure was followed by employing *R*-VANOL (0.105mmol, 1.2 equiv), dienophile chalcone **9** (0.087 mmol, 1 equiv) and diene **18** (63 mg, 5 equiv), the desired *endo* Diels-Alder adduct **19** and *exo* Diels-Alder adduct **20** (31.08 mg, 99%) were isolated as white solid. The ratio of *exo*-isomer to *endo*-isomer is 1:5.4. *endo* Diels-Alder adduct **19**: 90.7% *ee* (isopropanol : hexane = 1:99), retention time 5.2 min and 5.7 min; $[\alpha]^{22}$ D +170.3 (c 0.96, DCM). *exo* Diels-Alder adduct **20**: 37.6% *ee* (isopropanol:hexane = 2:98), retention time 4.7 min and 5.3 min; $[\alpha]^{23}$ D -10.63 (c 0.36, DCM).

Diels-Alder adduct (22): The general procedure was followed by employing *R*-VANOL (12 mg, 1.2 equiv), dienophile chalcone **9** (0.022 mmol, 1 equiv) and diene **21** (76 μ L, 20 equiv), the desired compound **22** (8.0 mg, 99%) was isolated as a light yellow oil and as a single regioisomer. 94.3% *ee* (isopropanol : hexane = 2:98), retention time 4.4 min and 5.1 min; [α]²²D +16.38 (c 0.47, DCM).

(-)-Nicolaioidesin C (1). The general procedure was followed by employing *R*-VANOL (79 mg, 1.2 equiv), dienophile chalcone 23 (47 mg, 0.18 mmol, 1 equiv), 5 Å MS (20 weight equiv to dienophile) and myrcene (0.52 mL, 20 equiv). The reaction was stirred at rt for 16 h, quenched by addition of H_2O (15.0 equiv) and filtered through the celite, further washed with EtOAc, and the

The Journal of Organic Chemistry

organic filtrates were collected and concentrated in vacuo. The residue was purified by flash chromatography to afford the desired Diels-Alder cycloadducts acetylated nicolaioidesin C (59.4 mg, 88%) and recovered chiral ligand (75 mg, 95%). To the resulting light yellow residue was added 2 mL of MeOH and 2 mL of saturated NaHCO₃ solution. The resulting pale yellow suspension was stirred at room temperature for 4 h, the reaction mixture was adjusted to pH 4 by adding 1 M HCl, extracted with EtOAc, washed with brine, dried over Na₂SO₄ and concentrated *in vacuo*. The residue was purified by column chromatography (hexane : EtOAc = 4:1), further separation was achieved by preparative TLC (hexane : EtOAc = 3:2) to afford the nicolaioidesin C (78%). 95.8% *ee* (isopropanol:hexane = 10:90), retention time 8.8 min and 10.4 min; $[\alpha]^{26}$ D -31(c 0.91, MeOH), while $[\alpha]^{25}$ D = -25 (c 1.0, MeOH) for (-)-nicolaioidesin C reported in literature.¹⁵

(-)-Panduratin A (2). The general procedure was followed by employing *S*-VANOL (58 mg, 2.0 equiv), dienophile chalcone 23 (20 mg, 1 equiv) and ocimene (600 mg, 20 equiv). The reaction was stirred at rt for 68 h, quenched by addition of H₂O (15.0 eq) and filtered through the celite, further washed with EtOAc, and the organic filtrates were collected and concentrated in vacuo. The residue was purified by flash chromatography to afford the desired Diels-Alder adduct acetylated panduratin A (14.8 mg, 51%, 57% brsm) was isolated as a light yellow oil. The resulting light yellow residue was dissolved in MeOH (1 mL), then added 1 mL of saturated NaHCO₃ solution. The resulting pale yellow suspension was stirred at room temperature for 8 h, the reaction mixture was adjusted to pH 4 by adding 1 M HCl, extracted with EtOAc (10 mL), washed with brine (10 mL), the resulting aqueous layer was extracted with EtOAc (10 mL), the combined organic layer was dried over anhydrous Na₂SO₄ and concentrated in vacuo. Purification on preparative TLC (15% EtOAc in hexane) afforded (-)-panduratin A (7.8 mg, 58%) as a light yellow solid. The

spectroscopic data for this compound were identical to those reported in the literature.^{10d} 86% *ee* (isopropanol:hexane = 10:90), retention time 4.9 min and 6.6 min; HRMS (ESI) m/z calculated for $C_{26}H_{30}O_4$ (M+H⁺): 407.22223, found: 407.22178; $[\alpha]^{23}_{D}$ -43 (c 0.39, EtOH), while $[\alpha]^{23}_{D}$ = -25 (c 0.07, MeOH) for natural (-)-panduratin A.

Chalcone (29). To a stirred solution of chalcone 25 (217.0 mg, 0.46 mmol) in MeOH (4.5 mL) was slowly added concentrated HCl (330 μ L) at rt. The resulting orange solution was stirred at rt for 20 h, then to the resulting orange solution was slowly added 4 M NaOH (3 mL) at 0 °C and the reaction was stirred at rt for 2 h. The reaction mixture was diluted with saturated aqueous NH₄Cl, adjusted to pH 4 by adding 1 M HCl, and extracted with EtOAc. The organic layer was successively washed with water, brine, dried over anhydrous Na₂SO₄, and evaporated under reduced pressure. The residue was dissolved in DMF (20 mL), K₂CO₃ (95 mg, 0.69 mmol) and MeI (37 µL, 0.60 mmol) were added to the resulting orange solution. The reaction mixture was kept at rt for 24 h and quenched by addition of H₂O (1 mL), and extracted with EtOAc. The organic layer was successively washed with water, brine, dried over anhydrous Na₂SO₄, and evaporated under reduced pressure. The crude residue was purified by flash chromatography (hexane : EtOAc = 4:1) to afford **29** (54.0 mg, 30%) as a vellow oil. ¹H NMR (400 MHz, CDCl₃) δ 8.01 (d, J = 16.0 Hz, 1H), 7.59 (d, J = 2.8 Hz, 1H), 7.56 (d, J = 2.8 Hz, 1H), 7.48 (d, J = 16.0 Hz, 1H), 6.71 (d, J = 8.8 Hz, 1H), 6.52 (dd, J = 8.8 Hz, 2.4 Hz, 1H), 6.46 (d, J = 2.4 Hz, 1H), 5.23-5.15 (m, 1H), 3.88 (s, 3H), 3.87 (s, 3H), 3.85 (s, 3H), 3.75(s, 3H), 3.40 (d, J = 6.7 Hz, 2H), 1.79 (s, 3H), 1.69 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) & 192.3, 162.8, 161.1, 160.1, 158.7, 138.6, 131.5, 130.1, 129.9, 126.6, 124.4, 123.7, 122.8, 117.3, 106.1, 105.3, 98.3, 63.0, 55.8, 55.5, 25.8, 22.8, 17.8; IR (neat) v_{max} 2936, 2838, 1652, 1593, 1463, 1333, 1271, 1212, 1092, 1031 cm⁻¹; HRMS (ESI) [M+H]⁺

 calculated for C₂₄H₂₉O₅: 397.2010, found: 397.2013.

Compound (31). Dried air was bubbled through a CH₂Cl₂ (40 mL) solution of chalcone **29** (1.9 g, 4.8 mmol) and tetraphenylporphine (10 mg, 0.024 mmol) as the photosensitizer. The reaction mixture was stirred at room temperature and irradiated with a halogen lamp (150 W) for 1.5 h. Then triphenylphosphine (1.4 g, 5.3 mmol) was added and the solution was stirred 16 h at room temperature before concentrated. The residue was purified by column chromatography (hexane : EtOAc = 3:1) to afford **31** (623 mg, 32%) as a yellow oil. ¹H NMR (400 MHz, CDCl₃) δ 7.97 (d, *J* = 16.0 Hz, 1H), 7.56 (t, *J* = 8.4 Hz, 2H), 7.44 (d, *J* = 16.0 Hz, 1H), 6.82 (d, *J* = 8.9 Hz, 2H), 6.74 (d, *J* = 8.7 Hz, 1H), 6.51 (dd, *J* = 8.6, 2.3 Hz, 1H), 6.45 (d, *J* = 2.2 Hz, 1H), 3.90 (s, 3H), 3.86 (s, 3H), 3.85 (s, 3H), 3.69 (s, 3H), 1.45 (s, 6H); ¹³C NMR (100 MHz, CDCl₃) δ 192.5, 162.9, 160.9, 160.1, 158.7, 142.9, 138.9, 130.9, 130.0, 127.2, 124.6, 119.3, 117.2, 116.1, 106.6, 105.4, 98.4, 71.5, 62.1, 55.8, 55.5, 55.5, 29.9, 29.7; IR (neat) v_{max} 3451, 2970, 1584, 1504, 1458, 1266, 1212, 1097 cm⁻¹; HRMS (ESI) [M+H]⁺ calculated for C₂₄H₂₉O₆: 413.1959, found: 413.1963.

Compound (30). The secondary allylic alcohol **30** was also isolated in 16% yield as a yellow oil. ¹H NMR (400 MHz, CDCl₃) δ 7.98 (d, *J* = 16.0 Hz, 1H), 7.57 (t, *J* = 8.8 Hz, 2H), 7.42 (d, *J* = 16.0 Hz, 1H), 6.74 (d, *J* = 8.8 Hz, 1H), 6.51 (dd, *J* = 8.6, 2.4 Hz, 1H), 6.45 (d, *J* = 2.4 Hz, 1H), 5.0 (s, 1H), 4.84(s, 1H), 4.29 (d, *J* = 8.4 Hz, 1H), 3.89 (s, 3H), 3.86 (s, 3H), 3.84 (s, 3H), 3.73 (s, 3H), 3.06 (dd, *J* = 13.5, 3.6 Hz, 1H), 2.89 (dd, *J* = 13.5, 9.0 Hz, 1H), 1.86 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 192.5, 162.9, 161.0, 160.2, 158.9, 147.6, 139.4, 130.3, 130.2, 126.5, 124.2, 120.6, 117.1, 110.0, 106.3, 105.4, 98.4, 75.8, 62.8, 55.9, 55.5, 55.4, 30.4, 18.1; IR (neat) v_{max} 3455, 2941, 2838, 1650, 1593, 1462, 1334, 1271, 1211, 1100 cm⁻¹; HRMS (ESI) [M+H]⁺ calculated for C₂₄H₂₉O₆: 413.1959, found: 413.1953.

Diene (32). A mixture of chalcone 31 (160 mg, 0.39 mmol), acetyl chloride (36 µL, 0.5 mmol) and pyridine (41 µL, 0.5 mmol) in benzene (3 mL) was heated to 60 °C for 8 h. Then, 15 mL of 5% aqueous NaHCO₃ were poured into the reaction mixture. The aqueous layer was extracted with EtOAc and the organic layer was washed with brine and dried over MgSO4. After evaporation of the solvents, the residue was purified by column chromatography (hexane : EtOAc = 9:1) to afford diene **32** (107 mg, 70% yield) as a yellow oil. ¹H NMR (400 MHz, CDCl₃) δ 7.99 (d, J = 16.0 Hz, 1H), 7.58 (d, J = 8.8 Hz, 1H), 7.55 (d, J = 8.8 Hz, 1H), 7.45 (d, J = 16.0 Hz, 1H), 7.35 (d, J = 16.4 Hz, 1H), 6.78 (d, J = 14.4 Hz, 1H), 6.75 (d, J = 6.8 Hz, 1H), 6.51 (dd, J = 8.8, 2.4 Hz, 1H), 6.45 (d, J = 2.4 Hz, 1H), 5.11 (d, J = 11.2 Hz, 2H), 3.92 (s, 3H), 3.86 (s, 3H), 3.84 (s, 3H), 3.71 (s, 3H) 2.01 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 192.4, 162.9, 160.9, 160.1, 158.7, 143.2, 138.9, 136.8, 130.1, 129.9, 127.2, 124.5, 119.8, 119.2, 117.3, 117.2, 106.6, 105.3, 98.3, 62.3, 55.9, 55.5, 55.4, 18.3; IR (neat) v_{max} 2939, 1651, 1588, 1464, 1334, 1270, 1212, 1099 cm⁻¹; HRMS (ESI) $[M+H]^+$ calculated for C₂₄H₂₇O₅: 395.1853, found: 395.1857.

Diels-Alder adduct (34). Racemic VANOL (117.3 mg, 0.27 mmol) was dissolved in THF (10 ml) and treated sequentially with BH₃THF (270 µL, 0.27 mmol) and glacial AcOH (15.5 µL, 0.27 mmol), the resultant mixture was stirred at room temperature for 25 min, and then was concentrated to dryness and further dried under high vacuum at room temperature for 15 min. The colorless residue was dissolved in THF (12 mL), the chalcone 28 (104 mg, 0.22 mmol) and 5Å MS were added, and the resulting dark red solution was stirred at room temperature for 1.5 h, followed by addition of diene 32 (220 mg, 0.56 mmol). The reaction mixture was stirred at rt for 72 h before filtered through celite. The organic layers were collected and concentrated. The residue was purified by column chromatography (hexane : EtOAc = 4:1) to afford a mixture of **34** and other

ACS Paragon Plus Environment

The Journal of Organic Chemistry

Diels-Alder adduct **33**. The mixture was separated by preparative TLC (hexane : EtOAc = 3:2, silica gel) to afford Diels-Alder adduct **34** (78 mg, 41% yield) as a yellow amorphous solid and another Diels-Alder adduct **33** (65 mg, 34 % yield). ¹H NMR (400 MHz, CDCl₃) δ 12.55 (s, 1H), 7.88 (d, *J* = 16.4 Hz, 1H), 7.59 (d, *J* = 8.4 Hz, 1H), 7.32 (d, *J* = 8.4 Hz, 1H), 7.27 (d, *J* = 8.8 Hz, 1H), 7.17 (d, *J* = 8.4 Hz, 1H), 7.07 (d, *J* = 12.8 Hz, 0.6 H), 6.82-6.90 (m, 3H), 6.53 (dd, *J* = 1.2, 8.4 Hz, 1H), 6.46 (s, 1H), 6.32-6.42(m, 3 H), 5.49 (s, 1H), 5.00 (t, *J* = 6.4, 13.2 Hz, 1H), 4.65 (s, 1H), 4.35 (s, 1H), 3.85 (s, 3H), 3.80 (s, 3H), 3.51 (s, 3H), 3.17 (d, *J* = 6.4 Hz, 5H), 2.35-2.45(m, 1H), 2.29 (s, 3H), 2.20 (s, 3H), 2.14-2.16 (m, 1H), 2.08 (s, 3H), 1.81 (s, 3H), 1.67 (s, 3H), 1.62 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 206.0, 192.1, 169.4, 168.8, 168.6, 162.9, 161.9, 160.4, 158.9, 153.8, 148.7, 135.4, 133.0, 132.0, 131.9, 131.4, 130.3, 127.9, 127.2, 126.1, 125.0, 122.4, 122.1, 119.3, 119.1, 118.1, 117.3, 117.0, 116.0, 112.6, 105.4, 105.2, 104.1, 98.2, 97.9, 62.6, 55.4, 55.4, 55.3, 54.7, 53.4, 35.0, 29.6, 25.6, 23.4, 22.5, 21.0, 20.9, 20.5, 17.7; IR (neat) v_{max} 2967, 2923, 2850, 1766, 1632, 1590, 1414, 1263, 2298 cm⁻¹; HRMS (ESI) [M+H]⁺ calculated for C₅₀H₅₃O₁₃: 861.3481, found: 861.3473.

Diels-Alder adduct (33). Using the same purification procedure, another Diels-Alder adduct **33** (65 mg, 34 % yield) was also obtained as a yellow amorphous solid. ¹H NMR (400 MHz, CDCl₃) δ 12.79 (s, 1H), 12.72 (s, 1H), 7.98 (m, 1H), 7.60 (d, *J* = 8.4 Hz, 1H), 7.42(d, 9.2 Hz, 1H), 7.36 (d, 15.6 Hz, 1H), 6.85 (d, *J* = 5.8 Hz, 2H), 6.75-6.37 (m, 3H), 6.37-6.18 (m, 1H), 6.11 (d, *J* = 8.7 Hz, 1H), 5.33 (d, *J* = 14.4 Hz, 1H), 4.96 (d, *J* = 6.3 Hz, 1H), 4.75-4.22 (m, 3H), 3.94 (s, 1H), 3.89 -3.73 (m, 7H), 3.70 (s, 1H), 3.59-3.38 (m, 3H), 3.21-2.86 (m, 3H), 2.50-2.33 (m, 3H), 2.24 (m, 4H), 2.21-2.09 (m, 5H), 1.76 (s, 3H), 1.66 (s, 3H), 1.61 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 208.6, 193.1, 169.1, 168.8, 168.3, 163.1, 161.6, 160.2, 160.0, 159.5, 153.9, 148.9, 148.6, 139.4, 131.9,

Diels-Alder adduct (36). Compound 34 (48.0 mg, 0.06 mmol) and K₂CO₃ (25.8 mg, 0.19 mmol) were dissolved in a MeOH/water (10:1, 3 mL) solution. The reaction mixture was stirred at rt for 1 h, then was quenched by addition of formic acid (42 μ L) at 0 °C, and then stirred at rt for an additional 10 min. The reaction mixture was diluted with water and extracted with EtOAc (10 mL \times 3), washed with brine, dried over anhydrous Na₂SO₄, and concentrated in vacuo. The residue was purified by flash chromatography (hexane : EtOAc = 2:1) to afford the *endo* Diels-Alder adduct **36** (29 mg, 72%), as a yellow amorphous powder. ¹H NMR (400 MHz, CDCl₃) δ 12.32 (s, 1H), 8.02 (d, J = 16.0 Hz, 1H), 7.68 (d, J = 9.2 Hz, 1H), 7.48 (m, 1H), 7.01 (d, J = 8.0 Hz, 1H), 6.56 (dd, J = 9.0 Hz, 1Hz, 1Hz), 6.56 (dd, J = 9.0 Hz, 1Hz, 1Hz), 6.56 (dd, J = 9.0 Hz, 1Hz), 6.56 (dd, J = 9.0 Hz, 1Hz), 6.56 (dd8.8, 2.4 Hz, 1H), 6.46 (d, J = 2.0 Hz, 1H), 6.36 (dd, J = 8.4, 4.4 Hz, 3H), 6.29 (s, 1H), 5.41 (s, 1H), 5.05 (s, 1H), 4.68 (s, 1H), 4.29 (s, 1H), 4.15 (dd, J = 11.2, 8.0 Hz, 1H), 3.85 (s, 12H), 3.80 (d, J = 12.2, 3.0 Hz, 1H), 3.85 (s, 12H), 3.80 (d, J = 12.2, 3.0 Hz, 1H), 3.85 (s, 12H), 3.80 (d, J = 12.2, 3.0 Hz, 1H), 3.85 (s, 12H), 3.80 (7.2 Hz, 1H), 3.49 (s, 3H), 3.21 (s, 3H), 2.54-2.13 (m, 2H), 1.80 (s, 3H), 1.66 (m, 6H); ¹³C NMR (100 MHz, CDCl₃) δ 207.2, 198.1, 163.6, 163.0, 162.5, 160.3, 155.2, 154.8, 135.5, 133.6, 130.8, 130.6, 130.2, 127.7, 124.9, 124.1, 121.8, 121.0, 117.2, 116.6, 113.9, 113.5, 108.4, 107.5, 105.6, 105.4, 104.9, 98.3, 63.0, 60.4, 55.5, 55.1, 52.3, 37.1, 35.5, 29.9, 29.7, 25.7, 23.6, 21.5, 21.0, 17.8; IR (neat) max 3359, 2962, 2923, 2850, 1589, 1504, 1461, 1267, 1161, 1093 cm-1; HRMS (ESI) $[M+H]^+$ calculated for C₄₄H₄₇O₁₀: 735.3164, found: 735.3156.

ASSOCIATED CONTENT

Supporting Information

Copies of NMR spectra and chiral HPLC chromatography for selected compounds, and X-ray crystallographic data (CIF file) for compound **51**. This material is available free of charge via the Internet at http://pubs.acs.org.

ACKNOWLEDGMENTS

We thank Ms. Mingyan Zhao, Rui Liu, Xiuli Han and Wei Li (NIBS) for NMR, HPLC-MS and GC-MS analysis, Dr. Jiang Zhou (Peking University) for HRMS analysis. We are grateful to the financial support from the National High Technology Projects 973 (2015CB856200) and NNSFC (21222209, 91313303, and 21472010).
