Mn(III)-Based Oxidative Free Radical Cyclizations of Unsaturated 2-Cyclohexenones and Aldehydes

Barry B. Snider* and Eugenia Y. Kiselgof

Department of Chemistry, Brandeis University, Waltham, MA 02254-9110

Abstract: Oxidative free-radical cyclizations of unsaturated 2-cyclohexenones **9a**, **9b**, **17**, and **24** with $Mn(OAc)_3$ afford unsaturated α '-keto radicals such as **10** that cyclize to afford bicyclic products. The major process with 2-cyclohexenone **27** is conjugate addition of acetate to form β -acetoxy α -keto radical **37**. Unsaturated aldehydes **45**, **57a**, and **57b** are oxidized to radicals that cyclize to give cyclopentane- and cyclohexanecarboxaldehdyes. Copyright © 1996 Elsevier Science Ltd

During the past decade Mn(III)-based oxidative free-radical cyclizations have been developed into a general procedure for producing highly functionalized products from simple precursors.¹ These cyclizations have been initiated by reaction of relatively acidic compounds, such as 1,3-diketones, acetoacetates, malonates, and α -sulfinyl or α -nitro ketones, with Mn(OAc)₃ to form a Mn(III) enolate, which undergoes electron transfer to give Mn(II) and a radical. We have recently shown that Mn(III)-based oxidative free-radical cyclization of unsaturated ketones in AcOH at 80 °C is a versatile synthetic procedure with broad applicability.² Bicyclic ketones that cannot enolize further are isolated in good yield. For instance, oxidation of cyclohexanone 1 with 2 equivalents of Mn(OAc)₃•2H₂O and 1 equivalent of Cu(OAc)₂•H₂O in AcOH at 80 °C for 18 h gives α -keto radical 2, which undergoes 6-*endo* cyclization to give bicyclic radical 3. Oxidative elimination with Cu(II) provides 66% of bicyclo[3.2.1]oct-2-en-8-one 4 and 7% of the double bond position isomer. Monocyclic ketones reduces that can enolize are oxidized further to provide γ -acetoxy- α , β -unsaturated ketones.

Watt and coworkers developed a reliable procedure for the oxidation of α , β -unsaturated ketones to α '-acetoxy- α , β -unsaturated ketones using excess dried Mn(OAc)₃ in benzene at reflux.³ For instance, **5** yields 81% of acetoxy enone **8**. The reaction presumably proceeds by formation of the Mn(III) enolate **6**, which loses

Mn(II) to give unsaturated α '-keto radical 7. Oxidation of radical 7 by a second equivalent of Mn(OAc)₃ provides acetate 8. The oxidation of 7 to give 8 must be rapid and efficient since acetoxy enones are formed in high yield. Our attempts to trap the unsaturated α '-keto radical obtained from Mn(OAc)₃ oxidation of 2-cyclohexenone by addition to 1-octene in AcOH were unsuccessful, giving only 6-acetoxy-2-cyclohexenone and oligomer.

Saturated ketones provide complex mixtures in $Mn(OAc)_3$ oxidations.⁴ Oxidation of cyclohexanone with $Mn(OAc)_3$ in AcOH at 70 °C affords 2-acetoxycyclohexanone (18%) and various dimers (8%). The formation of the acetoxy ketone and dimers is completely suppressed by the presence of 1-hexene in the reaction mixture. Under these conditions, 34% of several double bond addition products are obtained. The formation of dimers from the saturated α -keto radical, and the suppression of both dimerization and acetoxylation if an alkene is present in the reaction mixture, indicates that oxidation of saturated α -keto radicals to α -acetoxy ketones is much slower than the oxidation of unsaturated α' -keto radicals such as 7, which undergo acetoxylation in AcOH even if alkene is present.

Results and Discussion

Intramolecular trapping of unsaturated α' -keto radicals by suitably situated double bonds should be much faster than intermolecular addition and might be able to compete with acetoxylation. We were delighted to find that oxidation of unsaturated cyclohexenone $9a^5$ with 6 equiv of dried Mn(OAc)₃ and 1 equiv of Cu(OAc)₂ in benzene at reflux for 55 h provides 49% of an inseparable 20:1:1 mixture of dienones (13a, the stereoisomer with a β -isopropenyl group and the isopropylidene regioisomer), 16% of hydroxy enone 15a, and 5% of acetoxy enone 16a. The allylic methine hydrogen of 13a is axial since it absorbs at δ 2.09 (ddd, J = 11.7, 4.9, 3.4) with a large axial-axial coupling of 11.7 Hz to the adjacent axial methylene hydrogen. The structure of 15a was established by X-ray crystallographic structure analysis.⁶ The formation of three bicyclic products in 70% yield unambiguously establishes that unsaturated α' -keto radicals are formed in Mn(OAc)₃ oxidation of unsaturated ketones and that 6-*exo* cyclization of radical 10 is much faster than its oxidation to an α' -acetoxy enone.

Enolization of **9a** and loss of Mn(II) affords the unsaturated α' -keto radical **10a**, which undergoes a stereospecific 6-*exo* cyclization to give tertiary radical **11a** with an equatorial isopropyl group. Rapid oxidation of tertiary radical **11a** by either Mn(III) or Cu(II)¹ provides tertiary cation **12a**, which loses a proton to form dienone **13a** or reacts with acetate ion to give acetoxy enone **16a**. The formation of hydroxy ketone **15a** is atypical of Mn(OAc)₃ oxidative cyclizations and was particularly surprising under the nominally anhydrous reaction conditions. Examination of the NMR spectrum of the crude reaction mixture indicated the presence of a compound with an unconjugated cyclohexene double bond [6.45 (dd, J = 10.3, 1.5) and 5.45 (dd, 1, J = 10.3, 1.6)]. This material decomposes to **15a** on chromatography or on treatment with weak base suggesting that it is acylal **14a**. Cyclization of the carbonyl group of **12** to the cation and trapping with acetate provides **14a**, which is converted to hydroxy enone **15a** on workup or chromatography. As expected, similar mixtures of products are obtained without Cu(OAc)₂ since both Mn(III) and Cu(II) oxidize tertiary radicals to cations. Lower yields of the same products are obtained in AcOH.

The oxidative cyclization of **9b** was examined to determine whether tertiary unsaturated α' -keto radicals could be prepared and cyclized. Alkylation of the enolate of **9a** (LDA, DMPU, THF, MeI, -40 °C) provides 44% of **9b** as a 1:1 mixture of stereoisomers. Oxidative cyclization of **9b** with 2 equiv of dried Mn(OAc)₃ and 1 equiv of Cu(OAc)₂ in AcOH at 70 °C for 20 h affords 44% of a 3:1 mixture of **13b** (the only monomeric product) and recovered **9b**. Pure **13b** is obtained in 21% yield by carrying out the reaction with 4 eq of dried Mn(OAc)₃ to completely consume **9b**. Reaction in benzene was much slower and less efficient. This oxidative cyclization proceeds through cation **12b**, which loses a proton to give **13b**. The equatorial stereochemistry of the isopropenyl group follows from the absorption of the allylic methine hydrogen at δ 1.94 (dd, J = 13.5, 4.7). The differing reactivity of cations **12a** and **12b** is presumably due to steric hindrance between the bridgehead methyl group and the adjacent substituent, which is much worse with the trisubstituted sp³ carbon of **14b-16b** than with the isopropenyl substituent of **13b**. MM2 calculations⁷ indicate that **15b** is 8.0 kcal/mole more strained than **15a**, while **13b** is only 2.7 kcal/mole more strained than **13a**. Therefore, **12b** loses a proton to give **13b** rather than reacting with a nucleophile to give **14b-16b**.

Oxidative cyclization of 17 was examined to determine whether a less nucleophilic 1,2-disubstituted alkene would cyclize to the electrophilic unsaturated α '-keto radical. LAH reduction of 3-ethoxy-6-(3Z-hexenyl)-6methyl-2-cyclohexenone⁸ followed by acidic hydrolysis affords 88% of 17. Oxidative cyclization of 17 with 5 equiv of dried Mn(OAc)₃ and 1 equiv of Cu(OAc)₂ in benzene at reflux for 40 h provides a complex mixture containing 47% of *E*-disubstituted alkene 18, 14% of *Z*-disubstituted alkene 19, 9% of *E*-trisubstituted alkene 20, 0.5% of the *Z*-trisubstituted alkene 21, and 2% of each of the acetate diastereomers 22 and 23. Lower yields are obtained in AcOH. The equatorial stereochemistry is assigned by analogy to 13a and 16a. The stereochemistry of the trisubstituted alkenes 20 and 21 was assigned based on the shift of the bridgehead proton at δ 2.99 in 20 and δ 3.52 in 21 as has been observed in related compounds.⁹ We have obtained mixtures of alkene isomers similar to 18-21 by Cu(II) oxidation of secondary radicals formed in the oxidative cyclization of β -keto esters and diketones.⁸ The formation of secondary acetates 22 and 23 was unexpected and may result from participation of the carbonyl group in the oxidation of the secondary radical as in the formation of 14a.

The formation of bicyclic products in 75% yield establishes the generality of 6-*exo*-cyclizations of unsaturated α' -keto radicals.

Our initial trial with 5-*exo*/6-*endo* cyclization was much less successful. Oxidative cyclization of $24^{10,11}$ with 2 equiv of dried Mn(OAc)₃ and 1 equiv of Cu(OAc)₂ in AcOH at 80 °C for 6 h affords a mixture containing 12% of the known 5-*exo*- cyclization product 25^{11} and 3% of 6-*endo*-cyclization product 26. The position of the double bond in 26 is assigned based on the absence of coupling between the allylic methylene group and the bridgehead hydrogen and is expected since Cu(II) oxidation of the secondary radical should give the less hindered alkene.^{1d,2,12} Similar results are obtained in benzene. The low yield of bicyclic products from 24 suggests that 6-*exo* cyclizations of unsaturated α -keto radicals are faster than 5*exo*/6-*endo*-cyclizations.

Oxidative cyclization of 27 was examined to determine whether spirocyclic systems could be prepared by oxidative cyclization of unsaturated enones. Oxidative cyclization of 27^{13} with 2 equiv of dried Mn(OAc)₃ and 1 equiv of Cu(OAc)₂ in AcOH at 80 °C for 14 h gives a complex mixture containing at least seven products. The expected enolization and oxidation to give unsaturated α '-keto radical 28 occurs to only a minor extent. 6-*endo*-Cyclization of 28 gives 30, which is oxidized by Cu(II) to give 2% of 31. 5-*exo*-Cyclization of 28 provides 29 as a mixture of stereoisomers, which are oxidized by Cu(II) to give only 0.3% of 32. One isomer of 29 undergoes a rapid 1,5-hydrogen atom shift to form the thermodynamically more stable allylic radical 33. Oxidation of 33 by Mn(OAc)₃ yields 2.8% of a mixture of γ -acetoxy- α , β -unsaturated ketones 34 and 35 as we have previously reported in related systems.²

To our surprise, the major reaction is conjugate addition of acetate to enone 27 to give Mn(III) enolate 36, which loses Mn(II) to give radical 37 as a mixture of stereoisomers. 8-*endo*-Cyclization of 37 provides bicyclic secondary radical 38, which is oxidized by Cu(II) to give a mixture containing 39 (6%), 40 (18%), and 41 (1.5%). We have previously noted that Cu(II) oxidizes analogous alkyl radicals selectively to afford the least hindered alkene.^{2,12} The NMR spectra of 39 and 40 showed an isolated double bond and an acetate. The stereochemistry of the acetate was established by the absorption for the axial CHOAc methine hydrogen of 39 at δ 5.02 (ddd, 1, J = 11.0, 5.1, 5.1) and for the equatorial CHOAc methine hydrogen of 40 at δ 5.11 (br dd, 1, J = 3.0, 3.0).¹⁴ A similar reaction in benzene gives a low yield of 31 and none of 39-41. Although the yields of bicyclic products obtained from radical 37 are only modest, conjugate addition followed by enolate oxidation is a novel method of generating radicals. The formation of 37 as the major radical from 27, while 9, 17, and 24 provide only the unsaturated α' -keto radical, probably results from both the slower enolization of 27, which requires the abstraction of a more hindered methine hydrogen, and the unhindered double bond of 27 with C-4 unsubstituted, which facilitates conjugate addition. We are currently exploring radical generation by the addition of other nucleophiles to enones in the presence of Mn(OAc)₃.

Since the formation of radical **37** from enone **27** was unprecedented and an 8-*endo*-cyclization was unusual, we carried out an alternative synthesis to confirm the structures of **39** and **40**. Hydrolysis of the mixture of **39** and **40** with K_2CO_3 in MeOH (90%) and oxidation of the mixture of alcohols with PDC in CH₂Cl₂ (94%) give a single dione **44**. Hydrolysis of **42**¹⁵ with HCl in aqueous THF affords 77% of dione **43**. Oxidative cyclization of dione **43** with 2 equiv of Mn(OAc)₃ and 1 equiv of Cu(OAc)₂ in AcOH at 25 °C for 40 min provides 3% of **44** as the only monomeric product, thereby confirming the structures assigned to **39** and **40**. The poor yield in the 8-*endo*-cyclization of **43** contrasts to the 72% yield obtained in the 6-*exo*-

cyclization of 4-(3Z-hexenyl)cyclohexane-1,3-dione indicating the sensitivity of this reaction to the length of the tether.⁸ Presumably, dione 44 is oxidized further by Mn(III)-assisted enolization of the ketone in the three carbon bridge of 44 to give an unstrained Mn(III) 1Z,4*E*-cyclodecadienolate. Bicyclic ketones 39 and 40 are not oxidized further since enolization of the ketone would give a strained Mn(III) 1Z,4*E*-cyclooctadienolate.

Oxidative Cyclizations of Aldehydes. The oxidative intermolecular addition of aldehydes to alkenes proceeds in 30-40% yield based on $Mn(OAc)_3$ consumed if 10 equiv of aldehyde and 2 equiv of alkene are used.¹ Since use of excess substrate is not practical in intramolecular reactions, these conditions are not suitable for the oxidative cyclizations of unsaturated aldehydes. We examined the oxidative cyclization of unsaturated aldehydes. We examined the oxidative cyclization of unsaturated aldehydes to determine whether the initially formed cyclic product could be isolated or whether further oxidation would occur if excess aldehyde was not present. Reaction of citronellal (45) with 5 equiv of $Mn(OAc)_3 \cdot 2H_2O$ and $Cu(OAc)_2 \cdot H_2O$ in benzene at reflux for 6 h affords a mixture containing 30% of a 20:4:2:1 mixture of the known 5-methyl-2-isopropenylcyclopentanecarboxaldehydes 52,^{16,17} photocitral A (53),^{16,17} 54,^{16,17} and 55,¹⁷ 3% of acetoxy aldehyde 51, 5% of methoxytetrahydrofuran 56,¹⁸ and 11% of a 10:1 mixture of ene adducts isopulegol (49) and neoisopulegol (50). A similar reaction in AcOH yields mainly the ene adducts 49

and 50 as expected, since the ene reaction is acid catalyzed. Mn(III)-assisted enolization of 45 and loss of Mn(II) forms radical 46, which undergoes 5-*exo*-cyclization to give radical 47. Oxidation by Mn(III) or Cu(II) affords cation 48, which loses a proton to give 52-55 and reacts with acetate to give 51.

Competing ene reaction is not a problem with the less nucleophilic double bonds of 57a and 57b. Oxidative cyclization of 6Z-nonenal (57a) with 3 equiv of dried $Mn(OAc)_3$ and 1 equiv of $Cu(OAc)_2$ in AcOH at 90 °C for 90 min provides 25% of a 25:5.6:3:1 mixture of 59a-62a, respectively, 3% of dienal 64a,¹⁹ and 7% of acetoxy enal 67a. Cyclic radical 58 is formed analogously to 47. The secondary radical is oxidized by Cu(II) to alkenes 59a-62a and 65a. β,γ -Unsaturated aldehyde 65a is more acidic, and therefore more reactive,

than acyclic aldehyde 57a. It reacts rapidly with $Mn(OAc)_3$ to give allylic radical 66a, which is oxidized to give dienal 64a and acetate 67a.

The structures of 2-(1-propenyl)-cyclopentanecarboxaldehydes **59a-62a** were assigned based on analysis of the NMR spectral data, which indicated that the major products **59a** and **59b** have an *E*- and *Z*-double bond, respectively. The ¹³C NMR spectral data are virtually identical, except for a slight upfield shift for the alkene carbons, a 5.1 Hz upfield shift for the allylic methine carbon, and a 5.7 Hz upfield shift for the methyl group of **60a**. These similarities suggest that both of these compounds have the more stable²⁰ trans stereochemistry. Equilibration with Et_3N in THF at reflux did not change the ratio of **59a-62a**, confirming that **59a** and **60a** are the more stable trans isomers and suggesting that equilibration occurs under the reaction conditions in AcOH at 80 °C. The data for **67a** correspond closely to those for 2-alkyl-1-cyclopentenecarboxaldehydes.²¹

Oxidative cyclization of 7Z-decenal with 3 equiv of dried $Mn(OAc)_3$ and 1 equiv of $Cu(OAc)_2$ in AcOH at 80 °C for 10 h provides a mixture containing 43% of a 9:1 mixture of **59b** and **60b**, 3% of acetoxy enal **67b**, and 5% of a compound tentatively identified as γ -acetoxybutenolide **63b**. The CHCHO hydrogen of the major isomer **59b** absorbs at δ 2.07 (dddd, J = 10.8, 10.8, 3.6, 3.1). The two large axial-axial coupling constants indicate that both the aldehyde and alkenyl group are equatorial.²² The absorption of the CHCH=C hydrogen of the minor isomer **60b** at δ 2.53 (dddd, 10.5, 10.5, 10.5, 4.0) also has two large axial-axial coupling constants establishing that these two compounds differ only in the double bond stereochemistry. The ¹³C NMR spectral data are virtually identical, except for a slight upfield shift for the alkene carbons, a 5.2 Hz upfield shift for the allylic methine carbon, and a 5.7 Hz upfield shift for the methyl group of **60b**. The absence of **61b** and **62b** establishes that the 6-*exo*-cyclization leading to **58b** gives only the more stable trans diequatorial isomer.

The spectral data for **63b** correspond closely to those reported for analogous γ -acetoxybutenolides.²³ The ¹H NMR spectrum of **63b** shows no downfield protons, the ¹³C NMR spectrum shows two double bond carbons at δ 160.1 and 130.1 and the acylal carbon at δ 107.8, and the IR spectrum shows strong absorptions at 1777 and 1692 cm⁻¹. The mechanism of formation of **63b** is unclear, but probably proceeds through **65b** and may involve the γ -acetoxylation of a butenolide.²⁴

In conclusion, we have demonstrated that unsaturated α '-keto radicals formed by oxidation of 4-alkenyl-2cyclohexenones can be trapped efficiently in 6-*exo*-cyclizations. When the 6-position of the 2-cyclohexenone is substituted, addition of the acetate to the enone and oxidation of the enolate provides a novel route to radicals such as **37**. Oxidative 5- and 6-*exo*-cyclizations of unsaturated aldehydes can be carried out in moderate yield providing a short route to 2-alkenylcycloalkanecarboxaldehydes.

Experimental Section

General. NMR spectra were recorded in CDCl₃ at 300 MHz unless otherwise indicated. Chemical shifts are reported in δ ; coupling constants are reported in Hz. Mn(OAc)₃•2H₂O was purchased from Aldrich and dried for 1 d at 0.25 torr over P₂O₅ as described by Watt and coworkers.^{3b}

Oxidative Cyclization of 4-Methyl-4-(4-methyl-3-pentenyl)-2-cyclohexenone (9a). A degassed solution of enone $9a^5$ (300 mg, 1.56 mmol), dried Mn(OAc)₃ (2.1759 g, 9.38 mmol), and Cu(OAc)₂ (284 mg, 1.56 mmol) in 20 mL of benzene was stirred at reflux for 55 h. The resulting solution was green and contained some precipitate. It was diluted with water and aqueous 10% NaHSO₃ solution and extracted with ether (3 × 50 mL). The combined organic extracts were washed sequentially with saturated NaHCO₃, water, and brine and dried (MgSO₄). The solvent was removed under reduced pressure giving 270 mg of crude product. Flash chromatography on silica gel (10:1 hexane/EtOAc) gave 145 mg (49%) of a 20:1:1 mixture of

13a, the stereoisomer with an axial isopropenyl group and the isopropylidene regioisomer, followed by 19 mg (5%) of acetate **16a**, and 51 mg (16%) of alcohol **15a**, which was recrystallized from hexane at -40 °C.

The data for **13a**: ¹H NMR 6.55 (dd, 1, J = 9.9, 2.1), 6.06 (dd, 1, J = 9.9, 0.9), 4.82 (br s, 1), 4.57 (br s, 1), 2.73 (ddd, 1, J = 3.4, 3.4, 3.4), 2.15 (ddd, 1, J = 12.6, 3.4, 2.4), 2.09 (ddd, 1, J = 11.7, 4.9, 3.4), 1.82 (s, 3), 1.45-1.70 (m, 5), 1.15 (s, 3); ¹³C NMR 200.2 (C), 156.4 (CH), 146.2 (C), 131.1 (CH), 110.2 (CH₂), 46.5 (CH), 45.0 (CH), 42.5 (CH₂), 34.5 (CH₂), 33.8 (C), 28.4 (CH₃), 23.3 (CH₂), 22.5 (CH₃); IR (neat) 2927, 2853, 1673, 1453, 1372, 888 cm⁻¹.

Partial data for the isomer with an axial isopropenyl group: ¹H NMR 5.00 (ddq, 1, J = 1.4, 1.4, 1.4), 4.95 (br s, 1).

Partial data for the isopropylidene regioisomer: ¹H NMR 3.63 (dd, 1, J = 3.0, 3.0).

The ¹H NMR spectrum of the crude product showed peaks at δ 6.45 (dd, 1, J = 10.3, 1.5), 5.47 (dd, 1, J = 10.3, 1.6), 3.00 (m, 1), 2.01 (s, 3), 1.25 (s, 6), and 1.03 (s, 3) which were assigned to **14a**.

The data for **15a**: mp 67-68 °C; ¹H NMR 6.64 (dd, 1, J = 9.9, 2.2), 6.13 (dd, 1, J = 9.9, 1.0), 2.91-2.97 (m, 1), 2.13 (ddd, 1, J = 12.6, 3.9, 2.7), 2.00-2.08 (m, 1, OH), 1.71-1.81 (m, 1), 1.38-1.62 (m, 5), 1.37 (s, 3), 1.14 (s, 6); ¹³C NMR 205.9 (C), 158.1 (CH), 131.0 (CH), 72.1 (C), 49.8 (CH), 43.9 (CH), 43.0 (CH), 34.8 (CH₂), 33.7 (C), 29.3 (CH₃), 28.3 (CH₃), 28.0 (CH₃), 20.5 (CH₂); IR (CCl₄) 3565, 2956, 2858, 1664, 1455, 1385, 1372, 1081 cm⁻¹.

The data for **16a**: ¹H NMR 6.50 (dd, 1, J = 9.9, 2.2), 6.07 (dd, 1, J = 9.9, 1.1), 2.77-2.83 (m, 1), 2.12 (ddd, 1, J = 12.9, 3.7, 2.7), 1.89 (s, 3), 1.40-1.86 (m, 6), 1.52 (s, 3), 1.51 (s, 3), 1.12 (s, 3); ¹³C NMR 202.7 (C), 170.3 (C), 155.8 (CH), 130.9 (CH), 83.3 (C), 48.9 (CH), 44.2 (CH), 43.4 (CH₂), 34.6 (CH₂), 33.6 (C), 28.3 (CH₃), 24.6 (CH₃), 24.3 (CH₃), 22.1 (CH₃), 20.2 (CH₂); IR (neat) 2952, 2870, 1730, 1672, 1454, 1367 cm⁻¹.

Preparation of 4,6-Dimethyl-4-(4-methyl-3-pentenyl)-2-cyclohexen-1-one (9b). *N*-BuLi (1.64 mL of 2.5 M solution in hexane, 4.1 mmol) was added to a solution of 0.5 mL (3.9 mmol) of diisopropylamine in 2.3 mL THF at -20 °C. The resulting solution was stirred at this temperature for 20 min and cooled to -78 °C, and enone **9a** (500 mg, 2.6 mmol) in 1.0 mL of THF was added dropwise. The mixture was stirred for 0.5 h and warmed to -40 °C. DMPU (551 mg, 4.3 mmol) in 0.65 mL of THF and MeI (667 mg, 4.7 mmol) were added. The reaction mixture was warmed to rt and stirred for 2 h. The reaction was diluted with 50 mL of ether and washed with water and brine. The aqueous phase was back extracted with ether (2 × 30 ml) and the combined ethereal layers were dried (MgSO₄) and evaporated under reduced pressure. Flash chromatography on silica gel (10:1 hexane/EtOAc) provided 235 mg (44%) of pure **9b** as a 1:1 mixture of stereoisomers: ¹H NMR 6.62 (ddd, 1 × 0.5, *J* = 10.0, 2.2), 6.60 (ddd, 1 × 0.5, *J* = 10.0, 2.2), 5.86 (dd, 1, *J* = 10.0, 3.0), 5.04-5.14 (m, 1), 2.47-2.63 (m, 1), 2.10-1.89 (m, 3), 1.10-1.80 (m, 4), 1.69 (s, 3), 1.60 (s, 3), 1.19 (s, 0.5 × 3), 1.13 (d, 0.5 × 3, *J* = 6.6), 1.11 (s, 0.5 × 3), 1.11 (d, 0.5 × 3, *J* = 6.6); ¹³C NMR 202.0, (158.4, 157.9), (132.0, 131.9), (127.1, 126.8), 124.0, (43.1, 43.0), (42.1, 38.4), (37.5, 37.4), (36.7, 36.3), (27.2, 23.3), 25.7, 23.8, (22.6, 17.7), (15.2, 15.1); IR (neat) 2964, 2927, 2870, 1682, 1620, 1455, 1376, 1202, 1116, 814 cm⁻¹.

Oxidative Cyclization of 4,6-Dimethyl-4-(4-methyl-3-pentenyl)-2-cyclohexenone (9b). A degassed solution of enone **9b** (50 mg, 0.243 mmol), $Mn(OAc)_3$ (124 mg, 0.535 mmol), and $Cu(OAc)_2$ (44 mg, 0.243 mmol) in 2 mL of AcOH was stirred for 30 h at 70 °C at which time it was blue and contained a white precipitate. Water was added to dissolve the precipitate. The mixture was extracted with methylene chloride (3 × 30 mL). The combined organic layers were washed with saturated NaHCO₃ solution, water, and brine and dried (MgSO₄). Evaporation of the solvent under reduced pressure gave 48 mg of crude product. Flash chromatography on silica gel (6:1 pentane/Et₂O) gave 22 mg (44%) of a 3:1 mixture of **13b** and recovered **9b**. A similar reaction carried out with 250 mg (1.07 mmol) of Mn(OAc)₃ gave 10 mg (21%) of pure **13b** after flash chromatography: ¹H NMR 6.53 (dd, 1, J = 2.2, 9.8), 6.11 (d, 1, J = 9.8), 4.83 (br s, 1), 4.61 (br s, 1), 1.94 (dd, 1, J = 13.5, 4.7), 1.93 (dd, 1, J = 12.7, 2.4), 1.76 (dddd, 1, J = 13.5, 13.5, 11.9, 5.1), 1.56 (br s, 3),

1.40-1.62 (m, 4), 1.13 (s, 3), 1.03 (s, 3); ¹³C NMR 203.9, 155.9, 145.7, 131.1, 113.7, 53.9, 51.3, 46.3, 35.1, 34.7, 28.4, 25.9, 23.6, 21.1; IR (neat) 2924, 1667, 1453, 1374, 889, 835, 806 cm⁻¹.

Preparation of 4-Methyl-4-(3Z-hexenyl)-2-cyclohexen-1-one (17). A solution of LAH (1.0 mL of 0.93 M in THF, 0.93 mmol) was added dropwise to a solution of 3-ethoxy-6-methyl-6-(3Z-hexenyl)-2-cyclohexen-1-one⁸ (268 mg, 1.14 mmol) in 3 mL of Et₂O at 0 °C. After the addition was complete, the solution was warmed to rt and stirred for 1.5 h. The reaction was cooled to 0 °C and aqueous 25% H₂SO₄ (2 mL) was added with vigorous stirring. The mixture was stirred for 2.5 h and extracted with ether (2 × 30 ml). The ethereal layers were washed with saturated Na₂CO₃ solution, water, and brine, and then dried (MgSO₄). After evaporation of the solvent, the crude product was purified by flash chromatography on silica gel (10:1 hexane/EtOAc) to give 191 mg (88%) of **17**: ¹H NMR 6.70 (d, 1, *J* = 10.1), 5.89 (d, 1, *J* = 10.1), 5.25-5.44 (m, 2), 2.42-2.51 (m, 2), 1.94-2.12 (m, 5), 1.73-1.85 (m, 1), 1.44-1.58 (m, 2), 1.16 (s, 3), 0.97 (t, 3, *J* = 7.5); ¹³C NMR 199.0, 158.6, 131.8, 128.2, 127.1, 40.7, 35.4, 33.9, 33.2, 24.5, 21.7, 20.2, 14.0; IR (neat) 3007, 2961, 2871, 1683, 1462, 1390, 1373, 1116, 804 cm⁻¹.

Oxidative Cyclization of 4-Methyl-4-(3Z-hexenyl)-2-cyclohexen-1-one (17). A degassed solution of enone 17 (200 mg, 1.04 mmol), dried $Mn(OAc)_3$ (1.209 g, 5.2 mmol), and $Cu(OAc)_2$ (189 mg, 1.04 mmol) in 30 mL of benzene was heated at reflux for 40 h. Normal work up provided 192 mg of crude product. Flash chromatography on silica gel (14:1 hexane/EtOAc) gave 1 mg of 70% pure 21, followed by 122 mg of a 1:1.7:5.6 mixture of 20, 19, and 18, 18 mg of 2.2:2.5:8.5:1 mixture of 20, 19, 18, and recovered 17, 5 mg of 22, and 6 mg of 5:1 mixture of 22 and 23.

The data for 18: ¹H NMR 6.56 (dd, 1, J = 10.0, 2.2), 6.07 (dd, 1, J = 10.0, 1.0), 5.43 (ddq, 1, J = 15.3, 0.8, 6.1), 5.31 (ddq, 1, J = 15.3, 7.2, 1.3), 2.42-2.49 (m, 1), 2.06-2.26 (m, 2), 1.64 (dd, 3, J = 6.1, 1.3), 1.34-1.72 (m, 5), 1.14 (s, 3); ¹³C NMR 201.0, 156.9, 133.4, 131.2, 124.9, 49.2, 42.4, 42.0, 34.5, 33.7, 28.8, 25.9, 18.2; IR (neat) 3019, 2926, 2868, 1740, 1675, 1612, 1453, 1374, 1247, 1212, 1077, 964, 825, 731 cm⁻¹.

Partial data for 19: ¹H NMR 6.58 or 6.66 (dd, 1, J = 10.0, 2.2), 5.16 (ddq, 1, J = 11.3, 9.6, 1.6), 1.15 (s, 3).

Partial data for **20**: ¹H NMR 6.66 or 6.58 (dd, 1, J = 10.0, 2.3), 2.99 (br t, 1, J = 3.0), 1.15 (s, 3), 0.94 (t, 3, J = 7.5).

Partial data for **21**: ¹H NMR 6.64 (dd, 1, J = 10.0, 2.2), 6.10 (dd, 1, J = 10.0, 1.0), 5.29 (br td, 1, J = 7.4, 2.2), 3.52 (br t, 1, J = 3.0), 0.9-2.4 (m, 8), 1.14 (s, 3), 0.97 (t, 3, J = 7.5).

Partial data for **22**: ¹H NMR 6.55 (dd, 1, J = 10.0, 2.2), 6.08 (dd, 1, J = 10.0, 1.0), 4.67 (ddd, 1, J = 7.9, 7.9, 4.1), 2.56 (br s, 1), 2.17-1.45 (m, 9), 2.01 (s, 3), 1.13 (s, 3), 0.86 (t, 3, J = 7.4); ¹³C NMR 200.9, 170.6, 156.6, 131.0, 45.1, 42.4, 41.2, 34.1, 33.7, 28.4, 24.6, 21.9, 21.0, 9.0, the quaternary carbon was not observed.

Partial data for 23: ¹H NMR 6.51 (dd, 1, J = 10.0, 2.2), 6.07 (dd, 1, J = 10.0, 1.0), 4.56 (ddd, 1, J = 7.9, 6.6, 4.2), 2.73 (br s, 1), 2.07 (s, 3), 1.20-2.20 (m, 9), 1.13 (s, 3), 0.85 (t, 3, J = 7.5).

Oxidative Cyclization of 4-Methyl-4-(2-propenyl)-2-cyclohexen-1-one (24). A degassed solution of enone 24^{10} (100 mg, 0.67 mmol), Mn(OAc)₃ (327 mg, 1.41 mmol), and Cu(OAc)₂ (134 mg, 0.74 mmol) in 9 ml of AcOH was stirred for 5.5 h at 80 °C. The reaction was worked up as above giving 90 mg of crude product. Flash chromatography on silica gel (20:1 hexane/EtOAc) afforded 3 mg of a 1:6.8 mixture of 25 and 26, followed by 4 mg of a 6.7:1 mixture of 25 and 26, 3 mg of a 24.6:2:1 mixture of 25, 26, and recovered 24, and 13 mg of a 1.5:1 mixture of 25 and recovered 24.

The data for **25**: ¹H NMR 6.94 (dd, 1, J = 2.0, 9.6), 5.78 (dd, 1, J = 1.6, 9.6), 5.26 (br s, 1), 5.03 (br s, 1), 3.44 (br d, 1, J = 5.0), 2.37 (br s, 2), 2.07 (br d, 1, J = 11.0), 1.79 (ddd, 1, J = 2.0, 5.0, 11.0), 1.35 (s, 3); ¹³C NMR 198.8, 159.7, 146.1, 126.0, 112.0, 59.1, 47.0, 43.7, 42.9, 23.6; IR (neat) 2957, 2870, 1681, 1461, 1371, 883 cm⁻¹. The ¹H NMR and IR spectral data are identical to those previously reported.¹¹

The data for **26**: ¹H NMR 6.53 (dd, 1, J = 2.2, 10.0), 5.85 (dd, 1, J = 0.8, 10), 5.78 (br s, 2), 3.00 (br s, 1), 2.18 (br d, 1, J = 18.5), 1.94-2.07 (m, 2), 1.76 (ddd, 1, J = 2.2, 3.0, 12.4), 1.21 (s, 3); ¹³C NMR

155.9, 128.4, 125.8, 125.7, 45.6, 37.2, 35.8, 32.2, 28.7, the carbonyl carbon was not observed; IR (neat) 2922, 1686, 1460 cm⁻¹.

Oxidative Cyclization of 6-(4-Pentenyl)-2-cyclohexen-1-one (27). A degassed solution of enone 27^{13} (150 mg, 0.91 mmol), Mn(OAc)₃ (478 mg, 2.06 mmol), and Cu(OAc)₂ (165 mg, 0.91 mmol) in 10 mL of AcOH was stirred for 14 h at 80 °C. Normal work up afforded 155 mg of crude product. Flash chromatography (20:1 hexane/EtOAc) gave 3 mg of a 5:1 mixture of spiro compounds **31** and **32**, followed by 6 mg of a 2.5:1 mixture of spiro acetates **34** and **35**, 3 mg of **41**, 3 mg of a 90% pure 1.4:1 mixture of acetates **40** and **39**, and 46 mg of a 3:1 mixture of acetates **40** and **39**.

Partial data for **31**: ¹H NMR 6.88 (ddd, 1, J = 10.0, 4.0, 4.0), 5.95 (ddd, 1, J = 10.0, 2.1, 2.1), 5.66 (br s, 2), 2.60-1.57 (m, 10).

Partial data for **32**: ¹H NMR 6.95 (ddd, 1, J = 9.8, 3.8, 3.8), 6.04 (br d, 1, J = 9.8), 5.03 (br dd, 1, J = 1.8, 1.8), 4.80 (br dd, 1, J = 1.8, 1.8).

Partial data for 34: ¹H NMR 6.72 (ddd, 1, J = 10.2, 2.4, 1.4), 6.00 (dd, 1, J = 10.2, 2.0), 5.62-5.70 (m, 1), 2.28 (ddd, 1, J = 13.4, 5.4, 1.4), 2.11 (s, 3), 1.97 (dd, 1, J = 13.4, 8.8), 1.03 (d, 3, J = 7.1).

Partial data for **35**: ¹H NMR 6.69-6.75 (m, 1), 6.01 (dd, 1, J = 10.2, 2.2), 5.70-5.76 (m, 1), 2.13 (s, 3), 0.87 (d, 3, J = 6.7).

Partial data for **39**: ¹H NMR 5.43-5.59 (m, 2), 5.02 (ddd, 1, J = 11.0, 5.1, 5.1), 3.14 (m, 1), 2.07 (s, 3); ¹³C NMR 169.7, 130.8, 123.8, 72.9, 54.0, 49.4, 29.2, 28.5, 25.6, 22.9, 21.6, 20.9, the carbonyl carbon was not observed.

The data for **40**: ¹H NMR 5.47-5.56 (m, 2), 5.11 (br dd, 1, J = 3.0, 3.0), 2.95 (m, 1), 1.60-2.63 (m, 11), 2.03 (s, 3); ¹³C NMR 214.3, 170.2, 131.2, 124.4, 75.4, 55.7, 49.3, 28.2, 27.3, 26.6, 25.4, 22.5, 21.2; IR (neat) 3018, 2940, 2881, 1732, 1714, 1480, 1446, 1428, 1375, 1241, 1088, 1021, 872, 736, 701 cm⁻¹.

Partial data for **41**: ¹H NMR 5.53-5.65 (m, 1), 5.48 (br dd, 1, J = 10.9, 1.5), 5.20-5.35 (m, 1), 3.30 (br s, 1), 2.04 (s, 3).

Preparation of Bicyclo[5.3.1]undec-4-ene-8,11-dione (44). A mixture of K_2CO_3 (166 mg, 1.2 mmol) and **39** and **40** (10 mg, 0.045 mmol) in 2 mL of MeOH was stirred overnight. The resulting solution was diluted with water and extracted with ether twice. The combined ethereal layers were washed with brine and dried (MgSO₄). Evaporation of the solvent afforded 7 mg (90%) of a mixture of alcohols: ¹H NMR 5.41-5.61 (m, 2), 4.18 (br s, 0.75 × 1), 4.03 (br ddd, 0.25 × 1, J = 11.5, 4.8, 4.8, minor), 3.00-3.20 (m, 0.25 × 1), 2.85-3.00 (m, 0.75 × 1).

The mixture of alcohols (7 mg, 0.04 mmol) and PDC (46 mg, 0.12 mmol) in 1 mL of CH_2Cl_2 was stirred overnight. The resulting dark solution was filtered through silica gel and evaporated giving 7 mg (94%) of pure **44**: ¹H NMR 5.80 (ddd, 1, J = 10.5, 7.8, 0.8), 5.65 (dddd, 1, J = 10.5, 9.3, 6.8, 1.2), 3.27 (ddd, 1, J = 11.7, 7.0, 1.6), 2.96 (ddd, 1, J = 13.4, 11.7, 9.3), 2.72 (ddd, 1, J = 16.7, 3.5, 3.5), 2.67-2.81 (m, 1), 2.41-2.58 (m, 2), 2.35 (ddd, 1, J = 13.4, 7.0, 6.8), 2.26 (ddd, 1, J = 16.7, 13.9, 4.6), 1.91-2.14 (m, 3), 1.68 (dddd, 1, J = 14.0, 7.2, 4.0, 2.7); ¹³C NMR 211.5, 207.5, 133.1, 127.5, 67.9, 46.3, 38.2, 27.9, 26.3, 22.7, 21.3; IR (neat) 3023, 2934, 1694, 1476, 1314, 1255, 1165, 1143, 1116, 921, 883, 845, 734 cm⁻¹.

Preparation of 4-(4-Pentenyl)cyclohexane-1,3-dione (43). A solution of 3-ethoxy-6-(4-pentenyl)-2-cyclohexen-1-one¹⁵ (107 mg, 0.51 mmol) and 0.5 mL of 3 M HCl in 5 mL of THF was stirred overnight. The reaction was diluted with ether, washed with water and brine, dried (MgSO₄), and concentrated. Flash chromatography of the crude product on silica gel (5:1 hexane/EtOAc) gave 71 mg (77%) of dione 43: mp 41.5-43 °C; ¹H NMR 5.80 (dddd, 1, J = 17.1, 10.3, 6.8, 6.8), 5.02 (ddd, 1, J = 17.1, 3.2, 1.6), 4.97 (br d, 1, J = 10.3), 3.42 (br s, 2), 2.70 (ddd, 1, J = 16.1, 4.8, 4.5), 2.60 (dd, 1, J = 11.7, 5.7), 2.57 (ddd, 1, J = 16.1, 11.7, 5.6), 2.48 (dddd, 1, J = 11.7, 5.9, 5.9, 5.9, 5.9), 2.05-2.22 (m, 3), 1.83-1.94 (m, 1), 1.60 (dddd, 1, J = 13.9, 11.7, 11.7, 4.8), 1.37-1.54 (m, 2); ¹³C NMR 204.7, 204.0, 138.2, 114.9, 58.1, 49.2, 39.5, 33.7, 28.6, 26.3, 24.4; IR (neat) 2948, 2659, 2576, 1615, 1521, 1347, 1263, 1197, 909 cm⁻¹.

Oxidative Cyclization of Dione 43. A degassed solution of dione **43** (50 mg, 0.28 mmol), $Mn(OAc)_3$ (156 mg, 0.58 mmol), and $Cu(OAc)_2$ (51 mg, 0.28 mmol) in 5 mL of AcOH was stirred at rt for 2 h.

The reaction was worked up as above giving 20 mg of crude product. Flash chromatography on silica gel (6:1 hexane/EtOAc) gave 2 mg (3%) of pure 44. The ¹H NMR spectrum is identical to that of the sample prepared by hydrolysis and oxidation of 39 and 40.

Oxidative Cyclization of Citronellal (45). A degassed solution of citronellal (**45**) (509 mg, 3.3 mmol), $Mn(OAc)_3 \cdot 2H_2O$ (4.4237 g, 16.5 mmol), and $Cu(OAc)_2 \cdot H_2O$ (657 mg, 3.3 mmol) in 25 mL of benzene was stirred at reflux for 6.5 h. Work up as described above gave 472 mg of crude product. Flash chromatography on MeOH-deactivated silica gel (20:1 hexane/EtOAc) gave 93 mg of a 20:4:3:1 mixture of cyclopentanecarboxaldehydes 52-55, followed by 56 mg of a 20:3:1:1 mixture of **52-55**, 24 mg of tetrahydrofuran **56**, 12 mg of a 1:1:1 mixture of **49**, **50**, and **56**, and 64 mg of a 3:1 mixture of **49** and acetate **51**.

Partial data for **51**: ¹H NMR 9.50 (d, 1, J = 4.3), 1.92 (s, 3), 1.48 (s, 3), 1.44 (s, 3), 1.05 (d, 3, J = 6.4).

The data for **52**: ¹H NMR 9.53 (d, 1, J = 3.9), 4.72 (br s, 1), 4.75 (br s, 1), 2.85 (apparent q, 1, J = 8-9), 2.19-2.32 (m, 2), 1.87-2.05 (m, 2), 0.9-1.8 (m, 2), 1.72 (s, 3), 1.06 (d, 3, J = 6.3); ¹³C NMR 203.9, 145.9, 110.4, 63.7, 49.1, 36.2, 33.7, 30.3, 20.4, 19.5; IR (neat) 3077, 2870, 2708, 1723, 1645, 891 cm⁻¹. The spectral data are identical to those previously reported.¹⁶⁻¹⁷

Partial data for **53** ¹H NMR 9.75 (d, 1, J = 3.5), 3.06 (apparent q, 1, J = 8.9), 2.71 (ddd, 1, J = 8.7, 8.7, 3.5); ¹³C NMR 203.9, 146.4, 110.0, 58.6, 46.0, 37.3, 34.7, 30.6, 20.4, 16.7. The spectral data are identical to those previously reported.¹⁶⁻¹⁷

Partial data for 54: ¹H NMR 9.30 (d, 1, J = 4.5); ¹³C NMR 205.3, 111.5, 60.4, 49.0, 36.2, 34.4, 30.4, 23.0, 20.7. The spectral data are identical to those previously reported.¹⁶⁻¹⁷

Partial data for 55: ¹H NMR 9.51 (d, 1, J = 3.7).

Partial data for **56**: ¹H NMR 4.67 (br s, 1), 3.32 (s, 3), 1.33 (s, 3), 1.23 (s, 3), 1.06 (d, 3, J = 6.5). **Oxidative Cyclization of Z-6-Nonenal (57a).** A degassed solution of aldehyde **57a** (360 mg, 2.57 mmol), dried Mn(OAc)₃ (1.7895 g, 7.71 mmol), and Cu(OAc)₂ (467 mg, 2.57 mmol) in 30 mL of AcOH was stirred at 90 °C for 1.5 h. Normal workup gave 343 mg of crude product. Flash chromatography on silica gel (20:1 hexane/EtOAc) provided 89 mg (25%) of a 25:5.6:3:1 mixture of **59a-62a**, 20 mg (3%) of 40% pure **64a**, and 33 mg (7%) of **67a**.

The data for **59a**: ¹H NMR 9.58 (d, 1, J = 3.0), 5.49 (ddq, 1, J = 15.2, 0.7, 6.0), 5.39 (ddq, 1, J = 15.2, 7.2, 1.2), 2.66 (dddd, 1, J = 7.2, 9.0, 8.0, 8.0), 2.47 (dddd, 1, J = 3.0, 8.0, 8.0), 1.7-1.95 (m, 5), 1.65 (br d, 3, J = 6.0), 1.4-1.5 (m, 1); ¹³C NMR 203.7, 133.0, 125.3, 57.8, 44.9, 33.6, 26.0, 24.6, 17.8; IR (neat) 2959, 2871, 2712, 1724, 1450, 967, 734 cm⁻¹.

Partial data for **60a**: ¹H NMR 9.61 (d, 1, J = 2.8), 5.33 (ddq, 1, J = 10.8, 9.2, 1.6), 3.03 (ddddd, 1, J = 9.2, 8.3, 8.3, 8.3, 0.7); ¹³C NMR 203.4, 132.9, 124.6, 58.9, 39.3, 33.8, 26.1, 24.9, 13.1.

Partial data for **61a**: ¹H NMR 9.67 (d, 1, J = 2.8), 2.85-2.95 (m, 1), 2.76-2.85 (m, 1).

Partial data for **62a**: ¹H NMR 9.41 (d, 1, J = 3.4).

The ¹H NMR spectral data for 64a are identical to those previously reported.¹⁹

The data for **67a**: ¹H NMR 10.16 (s, 1), 5.92 (t, 1, J = 7.0), 2.58-2.65 (m, 4), 2.08 (s, 3), 1.65-1.95 (m, 4), 0.93 (t, 3, J = 7.4); ¹³C NMR 188.3, 170.2, 159.9, 140.5, 71.4, 34.3, 30.6, 26.7, 21.1, 20.9, 9.8; IR (neat) 2967, 2877, 2737, 1739, 1669, 1372, 1235, 1021, 961, 734 cm⁻¹.

Oxidative Cyclization of Z-7-Decenal (57b). A degassed solution of **57b** (300 mg, 1.95 mmol), dried $Mn(OAc)_3$ (1.36 g, 5.85 mmol), and $Cu(OAc)_2$ (354 mg, 1.95 mmol) in 20 mL of AcOH was stirred for 10 h at 80 °C. The reaction was worked up as above. Flash chromatography on silica gel (100:0 to 10:1 hexane/EtOAc) provided 111 mg of a 9:1 mixture of **59b** and **60b**, followed by 46 mg of 2:1 mixture of recovered **57b** and **59b**, 51 mg of oligomeric material, 25 mg of a fraction containing 50% of acetate **67b**, and 20 mg of acetoxy lactone **63b**.

The data for **59b**: ¹H NMR 9.54 (d, 1, J = 3.6), 5.46 (ddq, 1, J = 15.4, 6.4, 0.7), 5.31 (ddq, 1, J = 15.4, 7.7, 1.4), 2.19 (dddd, 1, J = 10.8, 10.8, 6.4, 3.5), 2.07 (dddd, 1, J = 10.8, 10.8, 3.6, 3.1), 1.70-1.85

(m, 4), 1.63 (d, 3, J = 6.1), 1.1-1.5 (m, 4); ¹³C NMR 205.6, 134.0, 125.6, 54.8, 41.3, 32.5, 25.8, 25.2, 24.5, 17.9; IR (neat) 2930, 2855, 2705, 1725, 1448, 967 cm⁻¹.

Partial data for **60b**: ¹H NMR 5.26 (ddq, 1, J = 11.0, 9.5, 1.5), 2.53 (br dddd, 1, J = 10.5, 10.5, 10.5, 4.0); ¹³C NMR 205.3, 133.2, 124.3, 55.2, 36.1, 32.2, 25.6, 25.2, 13.2, one carbon near δ 25 was not observed.

Partial data for **63b**: ¹H NMR 2.2-2.3 (m, 2), 2.1-2.2 (m, 2), 2.05 (s, 3), 1.56-1.86 (m, 6), 0.89 (s, 3, J = 7.4); ¹³C NMR 168.6, 160.1, 130.1, 107.8, 29.1, 22.4, 22.0, 21.8, 21.7, 20.3, 7.0, the lactone carbonyl carbon was not observed; IR (neat) 2938, 1777, 1692, 1369, 1218, 929 cm⁻¹.

Partial data for 67b: ¹H NMR 10.30 (s, 1), 6.04 (br t, 1, J = 7.2), 2.08 (s, 3), 0.92 (t, 3, J = 7.4).
