Abstract : Topostins B567 (2b) and D654 (3b) (WB-3559D, flavolipin) have been efficiently synthesized from 1,10-decanediol (5) in 11 and 13 steps, respectively, involving an asymmetric hydrogenation of the β -keto ester 14 using (*R*)-BINAP ruthenium bromide and a peptide coupling using diethyl phosphorocyanidate (DEPC, (EtO)₂P(O)CN) as key steps. © 1998 Published by Elsevier Science Ltd. Topostins were isolated from the culture broth of *Flexibacter topostinus* sp. nov., B-572, by Andoh and co-workers.¹ They have proved to be structurally novel inhibitors of mammalian DNA topoisomerase I. Topostin B comprises two components with the molecular weights of 553 and 567 in an equimolecular ratio, and was reported to be most active. Their structures have been tentatively assigned to be 1a for topostin B-1 and / or 1b for topostin B-2, shown in Fig. 1.² To establish the structure of topostin B, we synthesized³ topostin B analogs having the proposed structures 1a and 1b. Although some of them proved to exhibit an inhibitory action against mammalian DNA topoisomerase I, ^{3b,3c} spectral comparisons of our synthesized compounds with natural topostin B have revealed that they are different from each other even in their carbon skeletons.

Very recently, Ojika and co-workers⁴ reinvestigated the isolation and structures of topostins, and conclusively determined the structures of original topostins B, B553 (2a) and B567 (2b), as well as new analogs named topostins D, D640 (3a) and D654 (3b), as shown in Fig. 2. Among them, the gross structure of topostin B567 was found to be identical with that of cytolipin⁵ isolated from *Cytophaga johnsonae* while topostin D654 was identical with WB-3559D⁶ isolated from *Flavobacterium* sp. No. 3559 and flavolipin⁷ isolated from *Flavobacterium meningosepticum*. Furthermore, the western fragment of topostins B567 (2b) and D654 (3b), the (3R)-15-methyl-3-(13-methyltetradecanoyloxy)hexadecanoyl group, was found to be quite

similar to the western fragment of sulfobacin A^8 (4, flavocristamide B^9).¹⁰ We now wish to report the synthesis of topostins B567 and D654. Our synthesis of D654 proved to be much more efficient than previous efforts.^{6,7}

Fig. 2

The synthesis started from 1, 10-decanediol (5), which was benzylated to give the monobenzyl ether 6 accompanied by a small amount of the dibenzyl ether 7, as shown in Scheme 1. Swern oxidation of 6 or oxidation with tetra-n-propylammonium perruthenate (TPAP, Pr₄NRuO₄) and N-methylmorpholine-N-oxide (NMO) smoothly proceeded to give the aldehyde 8, which underwent the Wittig reaction with the ylide derived from isoamyltriphenylphosphonium bromide (9) to give the olefin 10. Catalytic hydrogenation of 10 over palladium-carbon quantitatively afforded the saturated alcohol 11, which was oxidized with either Jones reagent or pyridinium dichromate (PDC) to give the carboxylic acid 12. After conversion of 12 to the corresponding imidazolide with 1,1'-carbonyldiimidazole (CDI), the reaction with the magnesium enolate 13 of ethyl hydrogen malonate afforded the β -keto ester 14 in good yield.¹¹ Asymmetric hydrogenation of 14 smoothly proceeded by use of the ruthenium (II) catalyst 15 having (R)-2,2'-bis(diphenylphosphino)-1,1'-binaphthyl ((R)-BINAP, Ln) as a ligand¹² to give the required hydroxy ester 16, which was saponified to give the corresponding acid 17, whose spectral data and the specific rotation were identical with those reported,^{6b} proving its absolute configuration to be R. The enantioselectivity of the asymmetric hydrogenation was determined by conversion of 17 to its (S)- α -methoxy- α -trifluoromethylphenylacetyl (MTPA) derivative 19 via the methyl ester 18 and measurement of the NMR spectrum, revealing that the carboxylic acid 17 was almost enantiomerically pure.

Condensation of the hydroxy acid 17 with glycine *tert*-butyl ester hydrochloride (H-Gly-OBu^t +HCl, 20) smoothly proceeded by use of diethyl phosphorocyanidate (DEPC, $(EtO)_2P(O)CN)^{13}$ in the presence of triethylamine (TEA) to give the amide 21, which underwent the *O*-acylation with the carboxylic acid 12 using 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDCI+HCl) in the presence of 4-(*N*,*N*-dimethylamino)pyridine (DMAP) to afford the ester 22. Final acidic deprotection of 22 with trifluoroacetic acid (TFA) produced topostin B567 (2b). Furthermore, coupling of topostin B567 (2b) with L-serine benzyl ester trifluoroacetate (H-L-Ser-OCH₂Ph•TFA, 23) by use of DEPC furnished the benzyl ester 24 of topostin D654, which underwent the removal of the benzyl group by catalytic hydrogenolysis to give topostin D654

(3b). Topostins B567 and D654 thus synthesized were identical with samples derived from the natural source.⁴

In summary, we have achieved an efficient synthesis of topostins B567 and D654 in 11 and 13 steps, respectively. Most of the synthetic steps, except the preparation of the monobenzyl ether 6, proceed in greater than 90% yield. Our syntheses of topostins B567 and D654 are equivalent to the syntheses of the compounds having the gross structure of cytolipin and WB-3559D (hence flavolipin), respectively. The synthetic method is quite straightforward and will be useful for the synthesis of topostin analogs.

Experimental

Melting points were determined on a YAMATO MP-21 apparatus. Distillation was carried out using a Kugelrohr apparatus. All melting and boiling points were uncorrected. Infrared (IR) spectra were measured with a SHIMADZU FTIR-8100 spectrometer. ¹H and ¹³C Nuclear magnetic resonance (NMR) spectra were recorded on a JEOL EX-270 or α -500 spectrometer with tetramethylsilane (TMS) or CHCl₃ as an internal standard. Mass spectra were obtained on a JEOL SX 102A or AX 505HA spectrometer. Optical rotations were measured on a JASCO DIP-1000 automatic polarimeter. Silica gel BW-820MH or BW-200 (purchased from Fuji Silysia Chemical Co., Ltd.) was used for column chromatography. Tetrahydrofuran (THF) was dried by distillation from sodium benzophenone ketyl.
