Abstract: A direct method for the conversion of conjugated enals and enones into [1-[(trialkylsilyl)oxy]allyl]nickel(II) chloride complexes is described. Reaction of $R^1CH=CR^2CHO$ ($R^1 = H$, Me, Ph; $R^2 = H$ and $R^1 = H$; $R^2 = Me$) with Ni(COD)₂ (COD = 1,5-cyclooctadiene) and ClSiMe₂R³ (R³ = Me or t-Bu) affords bis[[1,2,3- η^3 -1-[(trialkylsily])oxy]-2-propeny](μ chloro)nickel(II)] complexes 1a-f as burgundy-red crystalline solids in high to excellent yields (86-98%). The X-ray crystal structure of 1c confirms the η^3 -bonding mode for the allyl ligand and provides evidence of significant overlap of oxygen lone pair electron density with the allyl π -system. Reaction of 3-buten-2-one with Ni(COD)₂ and Me₃SiCl similarly affords bis[[1,2,3- η^3 -1-methyl-1-[(trimethylsilyl)oxy]-2-propenyl](μ -chloro)nickel(II)] (1g) in 72% yield, while the corresponding 2-cyclopentenone reaction fails, giving rise to a nickel metal mirror. The latter reaction does, however, succeed when conducted in the presence of pyridine, giving bis(pyridine)(chloro)[1,2,3- η^3 -1-[(tert-butyldimethylsilyl)oxy]-2-cyclopentenyl]nickel(II) complex (1h) in 95% yield. Irradiation of 1e (R¹ = R² = H; R³ = t-Bu) in the presence of 2-iodopropane affords tert-butyldimethylsilyl (E)-enol ether 2a in 78% yield (E:Z = 10:1). Similar results are observed with [1-[(trialkylsilyl)oxy]allyl]nickel(II) chloride complexes generated in situ from propenal, 2-methylpropenal, 2-butenal, 2-methyl-2-butenal, hexenal, and 3-buten-2-one, in coupling reactions with 1-iodobutane, 2-iodopropane, 1-bromoethene, 2-bromopropene, bromobenzene, o-bromobenzaldehyde, and isobutyryl chloride, affording the corresponding silyl (E)-enol ethers in 60-78% isolated, purified yield, based on Ni(1,5-COD)₂. High C(3) regioselectivities (>20:1) are observed for all of the C(3)-unsubstituted enals, while lower regioselectivities, in the range of 4-6:1 before purification, are observed for the C(3)-substituted enals; regioisomerically pure materials are obtained upon chromatography. Moderate to high E:Z stereoselectivities (E:Z = 4-15:1 before purification; E:Z = 20-50:1 after chromatography) are observed in all cases, save the reaction of isobutyryl chloride with 1e and the reaction of the 3-buten-2-one-derived allylnickel complex with 2-bromopropene, both of which give 1:1 E:Z ratios. In a more convenient, economical, and general variant, Ni(COD)₂ is generated in situ via the sodium metal reduction of NiCl₂(pyridine)₄ (in turn prepared from $NiCl_2(H_2O)_6)$ in the presence of cyclooctadiene and reacted with the enal or enone in the presence of $ClSiMe_2R^3$ to afford the [1-[(trialkylsilyl)oxy]allyl](chloro)(pyridine)nickel(II) complex, which is treated with the halocarbon and irradiated to afford the usual silyl enol ether products. Yields of 63-84%, based on enal or enone, were observed in reactions with propenal, (E)-2-hexenal, 2-cyclopentenone, and 2-cyclohexenone in reactions with bromoethene, bromobenzene, and 1-iodobutane using this procedure.

Introduction

The coupling of halocarbons with α , β -unsaturated aldehydes and ketones is normally achieved via transition metal mediated conjugate addition chemistry¹ and usually entails initial conversion of the halocarbon electrophile into an organolithium or other organo(main group) reagent, followed by reaction with the transition metal and lastly the enal or enone electrophile. We report herein a simple, inexpensive, and general, reversed-polarity^{2,3} approach, wherein it is the enal or enone that is converted into an organometallic nucleophile and the halocarbon electrophile that is added last, a distinction that holds out the possibility of higher and/or complementary chemoselectivities (vide infra). The products are silyl enol ethers, useful as starting materials for aldol⁴ and enolate alkylation⁵ chemistry.

Allylnickel Complex Synthesis. Our approach is based, firstly, on the established utility of allylnickel reagents in halocarbon coupling reactions^{6,7} and, secondly, on the propensity of nickel(0) complexes of conjugated enals and enones to react with oxophilic metal or metalloid halides to afford [1-(metallo-/metalloidooxy)allyl]nickel(II) halide derivatives, first exemplified by the reaction of bis(acrolein)nickel(0) with HBr to afford (1hydroxyallyl)nickel(II) bromide.^{8,9} Following the latter precedent, the reaction of Ni(COD)₂ (COD = 1,5-cyclooctadiene), conveniently and inexpensively available via the 'Bu₂AlH reduction of (technical grade) Ni(acac)₂ in the presence of COD,¹⁰ with conjugated enals and chlorotrialkylsilanes was investigated.¹¹ A bright red precipitate, presumed to be a mono- or bis(enal)nickel(0) complex,¹² is initially formed upon mixing the enal and Ni(COD)₂; this rapidly redissolves upon addition of the chloro-

argument, to the C(3) regioselectivity of the halocarbon coupling chemistry (vide infra).

Although standard reaction conditions (C₆H₆, 25 °C) fail for methyl vinyl ketone, reaction at 0 °C in diethyl ether was found to give [1-methyl-1-[(trimethylsilyl)oxy]allyl]nickel(II) chloride dimer 1g, isolated in 72% yield as a thermally unstable, orange crystalline solid. (¹H NMR spectroscopy of 1g in C₆D₆ shows the presence of a 3:1 mixture of two isomers, tentatively assigned as syn-OSiMe₃-1g and anti-OSiMe₃-1g, respectively.) In contrast, reaction of 2-cyclopentenone with Ni(COD)₂ and Me₃SiCl under similar conditions (Et₂O, 0 °C) gave little or none of the desired product, and instead resulted in rapid formation of a nickel metal mirror. Reasoning that a more electron rich nickel(0) derivative would tend to bind the enone more tightly and accelerate O silylation by increasing the electron density on oxygen, the effect of added pyridine was examined and found to result in the clean formation of crystalline pyridine adduct 1h (eq 2).¹⁵

Halocarbon Coupling Reactions. As expected from the aforementioned precedents, 3.6.7 [1-[(trialkylsilyl)oxy]allyl]nickel(II) halide complexes react with a variety of halocarbons to afford the corresponding silvl enol ethers, as exemplified by the reaction of 1e with 2-iodopropane (eq 3).

Inasmuch as early research showed that there was little to be gained from isolating the allylnickel reagents prior to halocarbon coupling, the scope of these reactions has been explored by using one-pot reaction procedures, wherein the allylnickel derivative is generated in situ, typically on a 5-g scale, and reacted without

⁽¹⁵⁾ Studies of the effect of added pyridine on the ¹H NMR spectra of 1e in THF- d_8 show that the major species in solution is the mono(pyridine) complex. Johnson, J. R.; Mackenzie, P. B. Unpublished results.

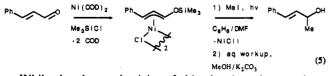

purification. Two protocols have been explored. The first to be developed (method A) involved reaction of $Ni(COD)_2$ (prepared via diisobutylaluminum hydride reduction of technical grade bis(acetylacetonate)nickel(II) in the presence of cyclooctadiene) with a mixture of the enal and *tert*-butyldimethylsilyl chloride to afford the allylnickel complex, which was then treated with the halocarbon and exposed to sunlight or irradiated with a sunlamp to achieve coupling (eq 4, Table II).

$$R^{1} \xrightarrow{2 \text{ COD}} R^{1} \xrightarrow{N_{1}} OSiMe_{2}B_{a} \xrightarrow{RX, hv} R^{1} \xrightarrow{R} OSiMe_{2}B_{a} \xrightarrow{RX, hv} R^{1} \xrightarrow{R} OSiMe_{2}B_{a} \xrightarrow{R} OSIMe_{2} \xrightarrow{R} OSIMe_{2$$

In accord with previous studies that showed that a coordinating cosolvent is required in similar halocarbon coupling reactions with allylnickel(II) halide^{6,7} and (1-alkoxyallyl)nickel(II) chloride³ complexes, the reactions were conducted in the presence of 10 equiv of dimethylformamide. The progress of the reaction was followed by monitoring the disappearance of the burgundy-red color of the [1-[(*tert*-butyldimethylsilyl)oxy]allyl]nickel starting material and the appearance of a green or brown-green precipitate of the nickel(II) dihalide coproduct, the supernatant becoming essentially colorless. The *tert*-butyldimethylsily enol ether products were recovered by buffered aqueous extraction and purified by chromatography and/or distillation to afford 2a-1 in 60-83% nonoptimized yield, based on Ni(COD)₂ (the most expensive reagent in this procedure). Crude yields were typically on the order of 80-90%.

With this method, successful reactions were observed with aryl bromide, alkenyl bromide, primary and secondary alkyl iodides, and isobutyryl chloride (Table II). Although initial experiments employed excess enal, t-BuMe₂SiCl, and halocarbon, later experiments showed that excess enal and t-BuMe₂SiCl had no effect. Excess halocarbon (3-10 equiv) was usually employed in order to minimize reaction time; reactions with smaller excesses (e.g., 1.1 equiv) proceed equally well but are correspondingly slower. Complexes derived from the C(3)-unsubstituted enals 2-propenal and 2-methylpropenal were found to react with essentially complete C(3) regioselectivity (>20:1). The isobutyryl chloride, alkenyl bromide, and o-bromobenzaldehyde reactions with these complexes are rapid and generally complete within 0-30 min of irradiation; the aryl bromide and alkyl iodide reactions are slower and typically require 4-14 h of irradiation to achieve complete reaction. Complexes derived from the C(3)-substituted enals 2-butenal, 2-methyl-2-butenal, and 2-hexenal were generally found to react more slowly and generate small amounts of nickel metal, but still gave good yields and moderate C(3) regioselectivities, (crude C(3):C(1) coupling ratio 4-6:1, Table II, entries 9-12). With the exception of the reactions giving rise to 2h and 2m, which were found to be completely nonstereoselective (E:Z = 1:1), moderate to high E:Z ratios (4-17:1 before purification; >20:1 after chromatography) were generally observed. (In the case of the monosubstituted enol ethers, the E and Z isomers give rise to well-separated C(1)H NMR signals with different coupling constants. In the case of the disubstituted enol ethers 2d and 2k, the coupling constants are similar for the E and Z isomers, but ¹H NOE experiments with 2d indicate that E isomer is still the major product.)

In contrast to the C(3) regioselectivity of the C(3)-alkyl-substituted enal reactions, the corresponding 3-phenylpropenal reaction was found to be highly C(1) regioselective (>20:1, eq 5), a change we tentatively attribute to the electronic effect of the 3-phenyl substituent, which presumably favors C(1) attack so the phenyl group can remain conjugated in the product.

While the chemoselectivity of this chemistry has not been extensively explored, the above experiments show that the chemistry can tolerate conjugated enal, enol ether, aromatic aldehyde, nitrile, amide, and styryl groups. The intermediate 1-allylnickel chloride is oxygen-sensitive, but is generated and reacted in situ, so that this is not a major concern. If necessary, water and other Bronsted acid impurities can be scavenged through the addition of (commercially available) $Me_2C=C(OMe)(OSiMe_3)$. This is especially convenient in the case of readily polymerizable enals such as propenal and 2-methylpropenal, which are stabilized with 3% water but need not be dried prior to use with this procedure.

Although useful for a variety of aldehydes and methyl vinyl ketone, the above method does not work for more substituted ketones such as 2-cyclopentenone and 2-cyclohexenone, which require a donor ligand such as pyridine for allylnickel complex formation (vide supra). Given the latter requirement, and wanting to explore in situ methods for generating $Ni(COD)_2$, we were prompted to examine the possibility that the method of Ohta et al.,¹⁶ sodium metal reduction of NiCl₂(pyridine)₄ in the presence of cyclooctadiene in THF at 0 °C, would be compatible with subsequent enal and enone chemistry. The pursuit of this possibility led to the development of a second, more convenient and economical procedure (method B), wherein both enals and enones can be converted to the corresponding silvl enol ethers in 63-84% nonoptimized yield (based on enal or enone) starting from NiCl₂(pyridine)₄, in turn readily prepared from inexpensive $NiCl_2(H_2O)_6$ (eq 6, Table II).

$$\begin{array}{c} \text{NiCl}_{2}(\text{H}_{2}\text{O})_{6} & \xrightarrow{C_{3}\text{H}_{3}\text{N}} \\ & \xrightarrow{-6 \text{ H}_{2}\text{O}} & \text{NiCl}_{2}(C_{3}\text{H}_{3}\text{N})_{4} & \xrightarrow{\text{one-pot}} \\ & \xrightarrow{1) 2 \text{ Ns}, \text{ xs COD}} \\ & 2) \text{ R}^{1}\text{CHR}^{2}\text{CHR}^{4}\text{CO}, \\ & \xrightarrow{Me_{2}\text{R}^{3}\text{SiCl}} \\ & 3) \text{ RX, hv} & 63-84\% \end{array}$$

With this procedure, successful reactions were observed with complexes derived from propenal, (E)-2-hexenal, 2-cyclopentenone, and 2-cyclohexenone in coupling reactions with 1-iodobutane, bromoethene, and bromobenzene, using both t-BuMe₂SiCl and Me₃SiCl (the products of the latter reactions being isolated as the corresponding ketones after hydrolysis with MeOH/K₂CO₃). As before, the silyl enol ether products were recovered by aqueous extraction, which removes all but the cyclooctadiene and any excess, nonvolatile halocarbon, followed by chromatography or distillation to isolate pure material.

Conclusion

The foregoing results demonstrate the feasibility of this simple new approach to enal and enone polarity reversal. As anticipated from literature precedents involving simple allylnickel(II) halide complexes,^{6,7} the [1-[(trialkylsilyl)oxy]allyl]nickel(II) reagents exhibit a promisingly high level of chemoselectivity. In the case of method B, these reactions are already competitive with organocuprate chemistry in terms of cost and convenience, and give respectable yields that are expected to improve upon optimization. The mechanism of these reactions has not been addressed, but is *tentatively* assumed to be similar to the nickel(I)/nickel(III) radical chain mechanism proposed by Hegedus et al.⁷ to describe the reactions of simple allylnickel halides with halocarbons. Studies designed to elucidate the mechanism are in progress, as are further explorations of the scope and chemoselectivity.

Experimental Section

A. General Methods. All manipulations were conducted in a nitrogen atmosphere drybox or on a dual-manifold Schlenk line by using purified, deoxygenated solvents and standard inert atmosphere techniques, unless otherwise stated. NMR spectra were recorded on a Varian XLA-400 Spectrometer (400 MHz for ¹H NMR; 101 MHz for ¹³C NMR). ¹H NMR chemical shifts are reported in parts per million downfield from tetramethylsilane but were measured relative to residual ¹H solvent resonances (C₆HD₅ at 7.15 ppm; CHCl₃ at 7.26 ppm). ¹³C NMR chemical shifts are reported in parts per million downfield from tetramethylsilane but were referenced to benzene- d^6 at 124.0 ppm or chloroform-*d* solvent at 77.0 ppm. Mass spectra were obtained on a VG high-resolution mass spectrometer, Model 70-250SE. Elemental analyses

⁽¹⁶⁾ Yamazaki, N.; Ohta, T. Polym. J. 1973, 4, 616.

were performed by G.D. Searle Research and Development, Skokie, IL, Oneida Research Services, Inc., Whitesboro, NY 13492, or Galbraith Laboratories, Inc., Knoxville, TN 37950.

Acetonitrile, acetonitrile- d^3 , dichloromethane, chloroform-d and N,Ndimethylformamide (DMF) were distilled from calcium hydride and stored under nitrogen. Benzene, benzene- d^6 , diethyl ether, tetrahydrofuran, and pentane were vacuum transferred from sodium benzophenone ketyl and stored under nitrogen. Gravity column chromatography employed Aldrich (70–270 mesh) silica gel. The following reagents were used as received or as otherwise noted: chlorotrimethylsilane (Aldrich, distilled from quinoline), methyl trimethylsilyl dimethylketne acetal (Aldrich, degassed), (E)-2-butenal (Aldrich, degassed), 2-methylpropenal (Aldrich, and tert-butyldimethylsilyl chloride (Aldrich). Bis(1,5cyclooctadiene)nickel(0) (Ni(COD)₂) was prepared according to literature procedure.¹⁰

B. [1-[(Trialkylsilyl)oxy]allyl]nickel Complexes. Typical Procedure for the Preparation of Complexes 1a-f. Preparation of Bis((u-chloro)- $[1,2,3-\eta^3-1-[(trimethylsilyl)oxy]-2-propen-1-yl]nickel(II)]$ (1a). In the drybox, a 50-mL Schlenk tube was charged with Ni(COD)₂ (500 mg, 1.82 mmol, 1.00 equiv), equipped with a stir bar, and sealed with a septum. On the line, a solution of propenal (244 $\mu L,$ 3.64 mmol, 2.00 equiv) in benzene (8 mL) in a 25-mL Schlenk vessel was treated with (MeO)(Me₃SiO)CCMe₂ (185 µL, 0.909 mmol, 0.500 equiv; added as a proton-scavenging reagent), stirred for 5 min and then transferred by cannula onto the Ni(COD)2. The resultant purple-red slurry was stirred for 10 min and then treated with Me₃SiCl (462 µL, 3.64 mmol, 2.00 equiv) to afford a deep red solution. After 45 min, the volatiles were removed at 0.1 mmHg to obtain an orange-red powder. This was extracted with pentane (20 mL) through a filter paper tipped cannula. The clear red filtrate was concentrated under vacuum to ca. 5 mL volume and then cooled to -20 °C for 24 h to induce crystallization. The precipitate was isolated by removal of the supernatant through a filter paper tipped cannula while maintaining the mixture at -20 °C and washed with pentane (2 × 3 mL) to yield 1a (0.349 g, 86%) as a burgundy-red crystalline solid: 400-MHz ¹H NMR (CD₃CN) δ 5.61 (1 H, d, J = 9.6 Hz), 5.22 (1 H, ddd, J = 12.4, 9.6, 6.2 Hz), 2.47 (1 H, d, J = 6.2 Hz), 1.30 (1 H, d, J = 12.4 Hz), 0.21 (9 H, s); 101-MHz NMR (C₆D₆) δ 103.0, 92.1, 37.6, -0.17; MS (70 eV) (isotopomeric intensity) m/z 450 (26.6 calcd, 15.6 obsd), 449 (17.1 calcd, 10.8 obsd), 448 (65.8 calcd, 54.8 obsd), 447 (25.3 calcd, 12.9 obsd), 446 (100.0 calcd, 100.0 obsd), 445 (15.7 calcd, 10.8), 444 (66.7 calcd, 58.1 obsd). Anal. Calcd for $C_{12}H_{26}Cl_2Ni_2O_2Si_2$: C, 32.26; H, 5.86. Found: C, 32.44; H, 5.57.

Bis[(μ-chloro)[1,2,3- π^3 -2-methyl-1-[(trimethylsilyl)oxy]-2-propenyl]nickel(II)] (1b): 400-MHz ¹H NMR (C₆D₆) δ 4.95 (1 H, s), 2.32 (1 H, s), 2.17 (3 H, s), 0.97 (1 H, s), 0.15 (9 H, s); 101-MHz ¹³C NMR (C₆D₆) δ 103.9, 99.5, 41.4, 16.2, -0.10; MS (70 eV) (isotopomeric intensity) m/z482 (1.8 calcd, 2.7 obsd), 481 (2.1 calcd, 3.2 obsd), 480 (7.9 calcd, 8.6 obsd), 479 (7.4 calcd, 7.5 obsd), 478 (26.9 calcd, 26.7 obsd), 477 (18.6 calcd, 20.3 obsd), 476 (66.2 calcd, 65.8 obsd), 475 (27.4 calcd, 31.0 obsd), 474 (100.0 calcd, 100.0 obsd), 473 (17.2 calcd, 18.2 obsd), 472 (66.4 calcd, 70.1 obsd). Anal. Calcd for C₁₄H₃₀Cl₂Ni₂O₂Si₂: C, 35.41; H, 6.37. Found: C, 35.02; H, 6.46.

Bis[(μ -chloro)[1,2,3- π^3 -1-[(trimethylsily])oxy]-2-butenyl]nickel(II)] (1c): 400-MHz ¹H NMR (CD₃CN) δ 5.39 (1 H, d, J = 9.2 Hz), 5.09 (1 H, dd, J = 12.2, 9.2 Hz), 2.13 (1 H, dq, J = 12.2, 6.0 Hz), 0.74 (3 H, d, J = 6.0 Hz), 0.20 (9 H, s); 101-MHz ¹³C NMR (CD₃CN) δ 102.1, 98.3, 55.9, 16.7, -0.33; MS (70 eV) (isotopomeric intensity) m/z 478 (26.9 calcd, 29.8 obsd), 477 (18.6 calcd, 18.1 obsd), 476 (66.2 calcd, 60.6 obsd), 475 (27.4 calcd, 29.3 obsd), 474 (100.0 calcd, 100.0 obsd), 473 (17.2 calcd, 14.9 obsd), 472 (66.4 calcd, 73.4 obsd). Anal. Calcd for C₁₄H₃₀Cl₂Ni₂O₂Si₂: C, 35.41; H, 6.37. Found: C, 35.45; H, 6.11.

Bis[(μ -chloro)[1,2,3- η^3 -1-[(trimethylsilyl)oxy]-3-phenyl-2-propenyl]nickel(II)] (1d): 400-MHz ¹H NMR (CD₃CN) δ 7.66–7.21 (5 H, m), 5.83 (1 H, d, J = 9.2 Hz), 5.74 (1 H, dd, J = 11.6, 9.2 Hz), 2.91 (1 H, d, J = 11.6 Hz), 0.26 (9 H, s); 101-MHz ¹³C NMR (C₆D₆) δ 141.1, 129.3, 129.2, 126.2, 101.2, 89.0, 53.8, -0.16. Anal. Calcd for C₂₄H₃₄Cl₂Ni₂O₂Si₂: C, 48.12; H, 5.72. Found: C, 48.47; H, 5.41.

Bis[(μ-chloro)[1,2,3- η^3 -1-[(*tert*-butyldimethylsilyl)oxy]-2-propenyl]nickel(II)] (1e): (prepared as per 1a but by using CH₃CN as the reaction solvent) 400-MHz ¹H NMR (C₆D₆) δ 5.09 (1 H, d, J = 9.6 Hz), 4.95 (1 H, ddd, J = 12.0, 9.6, 6.4 Hz), 2.27 (1 H, d, J = 6.4 Hz), 0.90 (1 H, d, J = 12.0 Hz), 0.87 (9 H, s), 0.22 (3 H, s), 0.14 (3 H, s); 101-MHz ¹³C NMR (C₆D₆) δ 103.3, 92.2, 37.6, 25.6, 18.1, -4.3, -5.7. Anal. Calcd for C₁₈H₃₈Cl₂Ni₂O₂Si₂: C, 40.72; H, 7.21. Found: C, 40.71; H, 7.16.

Bis[(μ -chloro)[1,2,3- η^3 -1-[(*tert*-butyldimethylsilyl)oxy]-2-butenyl]nickel(II)] (1f): (prepared as per 1a but by using CH₃CN as the reaction solvent) 400-MHz ¹H NMR (C₆D₆) δ 4.879 (1 H, m), 4.876 (1 H, d, J = 3.6 Hz), 1.764 (1 H, dq, J = 11.6, 6.4 Hz), 0.904 (9 H, s), 0.533 (3 H, d, J = 6.4 Hz), 0.251 (3 H, s), 0.160 (3 H, s); 101-MHz ¹³C NMR $(C_6D_6) \delta$ 98.34, 95.99, 53.59, 25.71, 18.19, 16.73, -4.27, -5.64; MS (70 eV) (isotopomeric intensity) m/z 556 (65.59 calcd, 66.66 obsd), 557 (21.36 calcd, 18.52 obsd), 558 (100.00 calcd, 100.00 obsd), 559 (33.77 calcd, 33.33 obsd), 560 (67.35 calcd, 66.66 obsd), 561 (22.77 calcd, 25.93 obsd), 562 (27.91 calcd, 25.93 obsd), 564 (8.35 calcd, 7.41 obsd). Anal. Calcd for C₁₀H₂₁OCINiSi: C, 42.97; H, 7.57. Found: C, 42.86; H, 7.41.

Bis[(μ -chloro)[2,3,4- η^3 -2-[(trimethylsily])oxy]-3-buten-2-yl]nickel(II)] (1g): (prepared as per 1a but by using Et₂O as the reaction solvent and a reaction temperature of 0 °C) 400-MHz ¹H NMR (C₆D₆) 4.702 (1 H, dd, J = 13.0, 7.0 Hz), 2.381 (1 H, d, J = 7.0 Hz), 1.188 (1 H, d, J =13.0 Hz), 1.137 (3 H, s), 0.224 (9 H, s); 101-MHz ¹³C NMR (C₆D₆) 115.26, 89.09, 36.64, 22.14, 1.14; MS (70 eV) (isotopomeric intensity) m/z 472 (66.43 calcd, 68.32 obsd), 473 (17.17 calcd, 13.26 obsd), 474 (100.00 calcd, 100.00 obsd), 475 (27.44 calcd, 25.97 obsd), 476 (66.18 calcd, 64.64 obsd), 477 (18.85 calcd, 15.65 obsd), 478 (26.89 calcd, 26.89 obsd), 480 (7.91 calcd, 7.36 obsd). (Elemental analysis was precluded by thermal instability of the solid at 25 °C.)

Bis(pyridine)(chloro)[1,2,3-n³-1-[(tert-butyldimethylsilyl)oxy]-2cyclopentyl]nickel(II) (1h). In a 100-mL Schlenk tube containing a magnetic stirring bar, solid Ni(COD)₂ (0.500 g, 1.00 equiv, 1.82 mmol) was sequentially treated with a solution of 2-cyclopentenone (0.152 mL, 1.82 mmol, 1.00 equiv) and pyridine (0.294 mL, 3.64 mmol, 2.00 equiv) in THF (4 mL), followed by t-BuMe₂SiCl (0.274 g, 1.82 mmol, 1.00 equiv) to afford a deep red solution. Removal of the volatiles at 0.1 mmHg and crystallization from a mixture of Et₂O (4 mL) and pentane (6 mL) gave the crude product as an orange crystalline solid, isolated by removal of the supernatant through a filter paper tipped cannula. Recrystallization (Et₂O/pentane, (Me₃)₂N-treated glassware) gave pure 1h (0.775 g, 95%). In solution, pyridine exchange occurs at a rate comparable to the NMR time scale at 25 °C and results in the near complete loss of ¹H and ¹³C signals for the pyridine ligand:¹⁵ 400-MHz ¹H NMR $(CD_3CN) \delta 5.45 (1 H, d, J = 3.2 Hz), 3.20 (1 H, m), 2.07 (1 H, ddd,$ J = 17.6, 8.0, 3.6 Hz, 1.71 (1 H, dd, J = 16.0, 7.6 Hz), 0.94 (1 H, m), 0.80 (9 H, s), 0.58 (1 H, m), 0.10 (3 H, s), 0.001 (3 H, s); 101-MHz ^{13}C NMR (C₆D₆) δ 151.2, 118.5, 84.7, 56.7, 33.7, 28.5, 25.7, 18.1, -4.1, -4.6. Anal. Calcd for C₂₁H₃₁ClOSiN₂Ni: C, 56.09; H, 6.95; N, 6.23. Found: C, 56.16; H, 6.79; N, 6.28.

C. Halocarbon Coupling Reactions. Silyl enol ethers 2m and 2o-p (Table II) were not isolated as such, but were rather hydrolyzed by treatment with MeOH/K₂CO₃ to afford the corresponding known ketones 5-methyl-5-hexen-2-one,¹⁷ 3-butylcyclopentanone,¹⁸ 3-phenyl-cyclopentanone,¹⁹ and 3-ethenylcyclohexanone.²⁰

Method A. Typical Procedure for the One-Pot Conversion of an Enal to the Corresponding [1-(tert-Butyldimethylsilyl)oxy]allyl]nickel Chloride Complex and Subsequent Halocarbon Coupling. Preparation of tert-Butyldimethyl[((E)-4-methyl-1-pentenyl)oxy|silane (2a) from Propenal, tert-Butylchlorodimethylsilane and 2-Iodopropane. A 100-mL Schlenk tube, equipped with a magnetic stir bar, was sequentially charged with t-BuMe₂SiCl (3.56 g, 23.6 mmol, 1.30 equiv), acetonitrile (30 mL), (MeO)(Me₃SiO)CCMe₂ (3.69 mL, 18.2 mmol, 1.00 equiv; added as a proton-scavenging reagent), and propenal (2.43 mL, 36.4 mmol, 2.00 equiv). The mixture was stirred for 5 min, during which time nitrogen was bubbled through the solution, and then transferred via cannula into a 100-mL Schlenk tube containing Ni(COD)₂ (5.00 g, 18.2 mmol, 1.00 equiv) and a spinning stir bar, with an acetonitrile wash (5 mL) to complete the transfer. The resultant deep burgundy-red solution was stirred for 1 h and then concentrated under reduced pressure (0.01 mmHg) for 14 h to afford crude 1e as a dark red solid contaminated with 1,5-cyclooctadiene. This was dissolved in acetonitrile (30 mL) and sequentially treated with (MeO)(Me₃SiO)CCMe₂ (0.10 mL, 0.49 mmol, 0.03 equiv), DMF (14.1 mL, 182 mmol, 10.0 equiv), and 2-iodopropane (14.1 mL, 181 mmol, 10.0 equiv). The resultant burgundy-red solution was stirred for 5 min and then irradiated with sunlight or a 275-W GE Model RSW sunlamp until the burgundy-red color of the allylnickel complex had been completely discharged (ca. 12 h), during which time a brown-green crystalline precipitate was deposited and the supernatant became light blue-green or nearly colorless (depending on the completeness of the precipitation). The supernatant was transferred via cannula into a round-bottom flask containing pentane, and the cloudy mixture was stirred for 30 min to complete precipitation of the nickel dihalide coproduct. The supernatant was then transferred through a filter paper tipped cannula onto a stirred aqueous buffer (150 mL of a pH 7 $KH_2PO_4/NaOH/H_2O$ solution). (An emulsion tends to form at this

stage if most of the nickel dihalide has not been removed through the prescribed procedure.) The pentane layer was separated, washed with water ($3 \times 20 \text{ mL}$), dried over MgSO₄, and concentrated under reduced pressure (15 mmHg) to afford crude **2a** (E:Z = 10:1) as a clear, yellow oil, contaminated by 1,5-cyclooctadiene and 2-iodopropane. Column chromatography (SiO₂, 343 g, 98:2 hexane/EtOAc) afforded pure **2a** (2.64 g, 68%; bp 76 °C at 15 mmHg; E:Z > 40:1): 400-MHz ¹H NMR (CDCl₃) δ 6.19 (1 H, dt, J = 12.0, 1.2 Hz), 4.98 (1 H, dt, J = 12.0, 8.0 Hz), 0.92 (9 H, s), 0.86 (6 H, d, J = 6.8 Hz), 0.13 (6 H, s); ¹³C NMR (CDCl₃) δ 140.7, 110.2, 36.6, 28.9, 25.8, 22.2, 18.4, -5.2; HRMS for C₁₂H₂₆OSi; calcd 214.1752, found 214.1737. Anal. Calcd for C₁₂H₂₆OSi; C, 67.22; H, 12.22. Found: C, 67.37; H, 12.23.

Reaction of Isolated 1e with 2-Iodopropane To Afford 2a. 1e (0.250 g, 0.942 mmol, 1.00 equiv) was dissolved in benzene (10 mL) and sequentially treated with (MeO)(Me₃SiO)CCMe₂ (191 μ L, 0.942 mmol, 1.00 equiv), 2-iodopropane (470 μ L, 4.71 mmol, 5.00 equiv), and DMF (729 μ L, 9.42 mmol, 10.0 equiv). Irradiation (GE sunlamp, 275 W Model RSW) for 14 h at 10 °C caused the initially burgundy-red solution to become almost colorless and deposit a mixture of brown and green crystals. Workup and chromatography as above gave 2a (157 mg, 78%).

Reaction of Isolated 1f with Bromoethene To Afford tert-Butyldimethyl[((E)-3-methyl-1,4-pentadienyl)oxy]silane (21). 1f (0.500 g, 1.73 mmol, 1.00 equiv) was dissolved in acetonitrile (5 mL) and sequentially treated with (MeO)(Me₃SiO)CCMe₂ (0.035 mL, 0.172 mmol, 0.100 equiv), DMF (0.665 mL, 8.60 mmol, 5.00 equiv), and bromoethene (0.365 mL, 5.17 mmol, 3.00 equiv) in the absence of light. After 35 min in the dark, the burgundy-red color of 1f was completely discharged and replaced by an emerald-green supernatant and a green-blue precipitate of crystalline nickel dihalide. Workup and chromatography (SiO₂, 180 g, 98:2 hexane/EtOAc) as above gave 21 (0.303 g, 83%; E:Z > 40:1 after purification, crude E:Z = 17:1) as a clear, colorless oil: 400-MHz ¹H NMR (C_6D_6) δ 6.30 (1 H, dd, J = 12.0, 1.0 Hz), 5.79 (1 H, ddd, J = 17.2, 10.3, 6.2 Hz), 5.13 (1 H, dd, J = 12.0, 4.0 Hz), 5.03 (1 H, d, J = 12.0, 4.0 Hz), 5.03 (1 Hz), 5.03 (1 Hz) 17.2 Hz), 4.93 (1 H, d, J = 10.2 Hz), 2.71 (1 H, m), 1.04 (3 H, d, J =6.9 Hz), 0.93 (9 H, s), 0.06 (6 H, s); 101-MHz 13 C NMR (C₆D₆) δ 143.9, 140.3, 115.9, 112.5, 36.5, 25.8, 21.2, 18.4, -5.2; HRMS for C₁₂-H24OSi, calcd 212.1596, found 212.1589. Anal. Calcd C12H24OSi: C, 67.86; H, 11.39. Found: C, 67.63; H, 11.03.

Method B. Typical One-Pot Procedure Starting from NiCl₂(C₅H₅N)₄. Preparation of tert-Butyldimethyl-[(3-ethenyl-1-cyclopentenyl)oxylsilane (2n) from 2-Cyclopentenone, tert-Butylchlorodimethylsilane and Bromoethene. A 100-mL Schlenk tube equipped with a magnetic stir bar and rubber septum was charged with $NiCl_2(pyridine)_4$ (10.0 g, 22.4 mmol, 1.00 equiv) and evacuated and refilled with N2 twice to establish an inert atmosphere. THF (40 mL) was added, followed by cyclooctadiene (8.20 mL, 67.2 mmol, 3.00 equiv), and the resultant mixture cooled to 0 °C. A second 100-mL Schlenk tube containing sodium metal strips (1.03 g, 44.8 mmol, 2.00 equiv; each ca. 2 cm × 0.4 cm × 0.1 cm) was connected to this flask with a flexible adaptor (available from Aldrich) under a rapid flow of N₂ (an inert atmosphere having previously been established in the second Schlenk tube and adaptor by capping the free end of the adaptor and evacuating and refilling with N₂). The sodium strips were then transferred to the stirred 0-5 °C reaction mixture in four portions over 1.5 h to give, after an additional 40 min at 0-5 °C, a very dark brown (but not black) supernatant, a small amount of precipitated yellow Ni(COD)₂, and no apparent blue NiCl₂(pyridine)₄. This was treated with a solution of 2-cyclopentenone (1.88 mL, 22.4 mmol, 1.00 equiv) and t-BuMe₂SiCl (3.38 g, 22.4 mmol, 1.00 equiv) in THF (15 mL) and stirred at 25 °C for 30 min to afford an orange mixture. A solution of bromoethene (4.74 mL, 67.2 mmol, 3.00 equiv) in THF (5 mL) was added via cannula, and the mixture was irradiated at 10 °C with a GE Model RSW sunlamp for 12.5 h to afford an olive-green precipitate and a light brown supernatant. The mixture was poured into a 2000-mL separatory funnel containing pentane (400 mL) and aqueous buffer (400 mL of KH₂PO₄/NaOH, pH 7) and shaken to give an emulsion that was filtered with suction through Celite to achieve separation. The organic phase was washed with water $(3 \times 300 \text{ mL})$, dried over MgSO₄, filtered, and concentrated under reduced pressure (15 mmHg) to afford a mixture of 2n and cyclooctadiene. Distillation through a 20-cm Vigreux column under reduced pressure afforded 2n as a clear, colorless oil (3.62 g, 72%; bp 80-82 °C at 3 mmHg): 400-MHz ¹H NMR (CDCl₃) δ 5.78 (1 H, ddd, J = 7.6, 10.0, 17.1 Hz), 4.97 (1 H, ddd, J = 17.1, 2.0, 1.2 Hz), 4.86 (1 H, ddd, J = 10.0, 0.8, 2.0 Hz), 4.56 (1 H, m), 3.24 (1 H, m), 2.27 (2 H, m), 2.10 (1 H, m), 1.57 (1 H, m), 0.93 (9 H, s), 0.17 (6 H, s); 101-MHz ¹³C NMR (CDCl₃) δ 156.1, 143.8, 111.9, 105.4, 45.9, 33.2, 28.8, 25.7, 18.1, -4.7. Anal. Calcd for C13H24OSi: C, 69.58; H, 10.78. Found: C, 69.87; H, 11.21.

tert-Butyldimethyl((E)-1-heptenyloxy)silane (2b). Reaction of Ni-(COD)₂ (5.00 g, 18.2 mmol, 1.00 equiv), propenal (2.43 mL, 36.4 mmol, 2.00 equiv), t-BuMe₂SiCl (3.56 g, 23.6 mmol, 1.30 equiv), and 1-iodobutane (4.14 mL, 36.4 mmol, 2.00 equiv) as per method A afforded, after chromatography (SiO₂, 369 g, 98.2 hexane/EtOAc), **2b** (3.16 g, 76%; E:Z > 25:1 after purification, crude E:Z = 10:1) as a clear, colorless oil (bp 104 °C at 11 mmHg): 400-MHz ¹H NMR (C_6D_6) δ 6.32 (1 H, dt, J = 12.0, 1.2 Hz), 5.18 (1 H, dt, J = 12.0, 7.6 Hz), 1.88 (2 H, dt, J = 7.6, 1.2 Hz), 1.30–1.05 (6 H, br m), 0.779 (3 H, t, J = 7.0 Hz), 0.95 (9 H, s), 0.08 (6 H, s); 101-MHz ¹³C NMR (C_6D_6) δ 140.5, 111.8, 31.6, 30.6, 27.7, 25.9, 22.9, 18.5, 14.3, -5.1; HRMS for C₁₃H₂₈OSi; calcd 228.1909, found 228.1909. Anal. Calcd for C₁₃H₂₈OSi: C, 68.35; H, 12.35. Found: C, 68.24; H, 12.43.

tert-Butyldimethyl((*E*)-1,4-pentadienyloxy)silane (2c). Reaction of Ni(COD)₂ (5.00 g, 18.2 mmol, 1.00 equiv), propenal (2.43 mL, 36.4 mmol, 2.00 equiv), *t*-BuMe₂SiCl (3.56 g, 23.6 mmol, 1.30 equiv), and vinyl bromide (4.14 mL, 36.4 mmol, 2.00 equiv) as per method A afforded, after chromatography (SiO₂, 309 g, 98:2 hexane/EtOAc), **2c** (2.79 g, 78%; *E:Z* > 20:1 after purification, crude *E:Z* = 7:1) as a clear, colorless oil: 400-MHz ¹H NMR (CDCl₃) δ 6.24 (1 H, dt, *J* = 11.9, 1.3 Hz), 5.81 (1 H, ddt, *J* = 17.1, 10.1, 6.1 Hz), 5.03 (1 H, ddt, *J* = 17.2, 1.8, 1.8 Hz), 5.00 (1 H, dt, *J* = 11.9, 7.2 Hz), 4.96 (1 H, ddt, *J* = 10.1, 1.8, 1.8 Hz), 2.64 (2 H, dddt, *J* = 6.7, 6.6, 1.4, 1.4 Hz), 0.92 (9 H, s), 0.13 (6 H, s); 101-MHz ¹³C (CDCl₃) δ 141.2, 137.4, 114.4, 108.9, 31.5, 25.7, 18.3, -5.2; HRMS for C₁₁H₂₂OSi, calcd 198.1440, found 198.1436. Anal. Calcd for C₁₁H₂₂OSi: C, 66.60; H, 11.18. Found: C, 66.51; H, 11.19.

tert-Butyldimethyl[((E)-2-methyl-1,4-pentadienyl)oxy]silane (2d). Reaction of Ni(COD)₂ (5.00 g, 18.2 mmol, 1.00 equiv), 2-methylpropenal (3.01 mL, 36.4 mmol, 2.00 equiv), t-BuMe2SiCl (3.56 g, 23.6 mmol, 1.30 equiv), and vinyl bromide (4.14 mL, 36.4 mmol, 2.00 equiv) as per 2a afforded, after chromatography (SiO₂, 307 g, 98:2 hexane/EtOAc), 2d (2.85 g, 74%; E:Z > 40:1 after purification, crude E:Z = 8:1) as a clear, colorless oil: 400-MHz ¹H NMR (CDCl₃) δ 6.09 (1 H, d, J = 1.6 Hz), 5.74 (1 H, ddt, J = 17.0, 9.8, 6.8 Hz), 5.03 (1 H, dd, J = 17.0, 1.6 Hz), 4.98 (1 H, dd, J = 9.8, 1.6 Hz), 2.60 (2 H, d, J = 6.8 Hz), 1.57 $(3 \text{ H}, d, J = 1.6 \text{ Hz}), 0.92 (9 \text{ H}, \text{s}), 0.12 (6 \text{ H}, \text{s}); 101-\text{MHz} {}^{13}\text{C} (\text{CDCl}_3)$ δ 137.4, 134.9, 115.7, 115.2, 38.3, 25.7, 18.3, 12.8, -5.3; HRMS for C₁₂H₂₄OSi, calcd 212.1596, found 212.1607. Anal. Calcd for C₁₂H₂₄OSi: C, 67.86; H, 11.39. Found: C, 67.63; H, 11.01. NMR NOE results (CDCl₃) are the following: Irradiation of the pentadienyloxy C(1)H at 6.09 ppm resulted in a 3% enhancement of the pentadienyloxy C(3)H resonance at 2.60 ppm. No enhancement of the pentadienyloxy C(2) methyl group protons at 1.57 ppm was observed. The enol ether is therefore inferred to have the E configuration.

tert-Butyldimethyl[((*E*)-4-methyl-1,4-pentadienyl)oxylsilane (2e). Reaction of NiCl₂(pyridine)₄ (5.00 g, 11.2 mmol, 1.00 equiv), sodium (515 mg, 22.4 mmol, 2.00 equiv), 1,5-cyclooctadiene (4.12 mL, 33.6 mmol, 3.00 equiv), propenal (748 μ L, 11.2 mmol, 1.00 equiv), *t*-BuMe₂SiCl (1.69 g, 11.2 mmol, 1.00 equiv), (MeO)(Me₃SiO)CCMe₂ (228 μ L, 1.12 mmol, 0.100 equiv), and 2-bromopropene (3.00 mL, 33.6 mmol, 3.00 equiv) as per method B afforded, after chromatography (450 g SiO₂, 98:2 hexane/EtOAc), **2e** (1.99 g, 84%; *E:Z* > 30:1 after purification, crude *E:Z* = 10:1) as a clear, colorless oil (bp 77 °C at 7 mmHg): 400-MHz ¹H NMR (C₆D₆) δ 6.27 (1 H, dd, *J* = 12.0, 1.2 Hz), 5.19 (1 H, dt, *J* = 12.0, 7.6 Hz), 4.85 (1 H, br s), 4.78 (1 H, br s), 2.53 (2 H, d, *J* = 7.6 Hz), 1.64 (3 H, s), 0.93 (9 H, s), 0.06 (6 H, s); 101-MHz ¹³C NMR (C₆D₆) δ 145.5, 141.9, 110.5, 109.3, 36.1, 25.8, 22.3, 18.4, -5.1; HRMS for C₁₂H₂₄OSi; calcd 212.1596, found 212.1599. Anal. Calcd for C₁₂H₂₄OSi: C, 67.80; H, 11.39. Found: C, 67.42; H, 11.39.

tert-Butyldimethyl((*E*)-3-phenyl-1-propenyl)oxy silane (2f). Reaction of NiCl₂(pyridine)₄ (5.00 g, 11.2 mmol, 1.00 equiv), sodium (515 mg, 22.4 mmol, 2.00 equiv), 1,5-cyclooctadiene (4.12 mL, 33.6 mmol, 3.00 equiv), propenal (748 μ L, 11.2 mmol, 1.00 equiv), *t*-BuMe₅SiCl (1.69 g, 11.2 mmol, 1.00 equiv), and bromobenzene (3.40 mL, 33.6 mmol, 3.00 equiv) as per method B afforded, after chromatography (600 g SiO₂, 98.2 hexane/EtOAc), **2f** (1.94 g, 70%; *E*:*Z* > 30:1 after purification, crude *E*:*Z* = 10:1) as a clear, colorless oil: 400-MHz ¹H NMR (C₆D₆) δ 7.13 (5 H, m), 6.30 (1 H, dt, *J* = 11.6, 1.6 Hz), 5.29 (1 H, dt, *J* = 11.6, 7.6 Hz), 3.12 (2 H, d, *J* = 7.6, 1.6 Hz), 0.92 (9 H, s), 0.05 (6 H, s); 101-MHz ¹³C NMR (C₆D₆) δ 141.8, 141.7, 128.6, 128.6, 126.2, 110.6, 25.80, 18.4, -5.1; HRMS for C₁₅H₂₄OSi: C, 72.52; H, 9.74. Found: C, 72.73; H, 9.79.

tert-Butyldimethyl[[(E)-3-(2-formylphenyl)-1-propenyl]oxy silane (2g). Reaction of Ni(COD)₂ (5.00 g, 18.2 mmol, 1.00 equiv), propenal (2.43 mL, 36.4 mmol, 2.00 equiv), t-BuMe₂SiCl (3.56 g, 23.6 mmol, 1.30 equiv), and o-bromobenzaldehyde (2.55 mL, 21.8 mmol, 1.20 equiv) as per method A afforded, after chromatography (SiO₂, 483 g, 98:2 hexane/EtOAc), pure 2g (3.48 g, 69%; E:Z > 40:1 after purification, crude E:Z = 4:1) as a clear, colorless oil: 400-MHz ¹H NMR (C₆D₆) δ 10.02 (1 H, s), 6.97 (4 H, br m), 6.31 (1 H, d, J = 12.0, 1.0 Hz), 5.26 (1 H, dt, J = 12.0, 7.2 Hz), 3.52 (2 H, d, J = 7.2 Hz), 0.90 (9 H, s), 0.03 (6 H, s); 101-MHz ¹³C NMR (C₆D₆) δ 191.8, 144.0, 142.3, 134.3, 133.5, 132.4, 130.4, 126.6, 110.2, 30.6, 25.8, 18.4, -5.2; HRMS for C₁₆H₂₄O₂Si; calcd 276.1546, found 276.1533. Anal. Calcd for C₁₆H₂₄O₂Si: C, 69.52; H, 8.75. Found: C, 69.15; H, 8.49.

(E)- and (Z)-2-Methyl-6-[(tert-butyldimethylsilyl)oxy]-5-hexen-3-one (2h). Reaction of Ni(COD)₂ (5.00 g, 18.2 mmol, 1.00 equiv), propenal (2.43 mL, 36.4 mmol, 2.00 equiv), t-BuMe₂SiCl (3.65 g, 23.6 mmol, 1.30 equiv), and isobutryl chloride (2.29 mL, 21.9 mmol, 1.00 equiv) according to method A afforded, after distillation (bp 65 °C at 2 mmHg), **2h** (3.03 g, 60%; E:Z = 1:1 before and after purification) as a clear yellow oil. Chromatography (254 g SiO2, 98:2 hexane/EtOAc) separated E and Z isomers: 400-MHz ¹H NMR (C_6D_6) for (Z)-2h δ 6.17 (1 H, dd, J = 5.8, 1.5 Hz), 4.84 (1 H, dt, J = 7.0, 5.8 Hz), 3.22 (2 H, dd, J = 7.0, 1.5 Hz), 2.36 (1 H, septet, J = 6.9 Hz), 0.95 (6 H, dd, J = 6.9, 0.72 Hz), 0.89 (9 H, s), -0.01 (6 H, s); 400-MHz ¹H NMR (C₆D₆) for (E)-2h δ 6.24 (1 H, dt, J = 12.0, 1.4 Hz), 5.28 (1 H, dt, J = 12.0, 7.4Hz), 2.70 (2 H, dd, J = 7.4, 1.3 Hz), 2.24 (1 H, septet, J = 7.0 Hz), 0.88 $(6 \text{ H}, d, J = 7.0 \text{ Hz}), 0.92 (9 \text{ H}, \text{s}), 0.06 (6 \text{ H}, \text{s}); 101-\text{MHz}^{13}\text{C} \text{ NMR}$ (CDCl₃) (E)-2h & 213.3, 140.8, 101.9, 40.0, 36.0, 25.5, 18.3, 18.2, -5.4, HRMS for C12H23OSi, calcd 227.1467, found 227.1475.

tert-Butyldimethyl((*E*)-3-phenyl-1-butenyl)oxylsilane (2i). Reaction of Ni(COD)₂ (5.00 g, 18.2 mmol, 1.00 equiv), 2-butenal (3.01 mL, 36.4 mmol, 2.00 equiv), *t*-BuMe₂SiCl (3.56 g, 23.6 mmol, 1.30 equiv), and bromobenzene (5.74 mL, 54.5 mmol, 3.00 equiv) as per method A afforded, after chromatography (424 g SiO₂, 98:2 hexane/EtOAc), 2i (3.11 g, 65%; *E:Z* > 50:1 after purification, crude *E:Z* = 6:1; crude C(3):C(1) coupling product ratio 6:1) as a clear, colorless oil: 400-MHz ¹H NMR (C₆D₆) δ 7.08 (5 H, br m), 6.30 (1 H, dd, *J* = 12.0, 1.0 Hz), 5.35 (1 H, dd, *J* = 7.0 Hz), 0.91 (9 H, s), 0.03 (6 H, s); 101-MHz ¹³C NMR (C₆D₆) δ 147.1, 140.1, 128.6, 127.3, 126.2, 117.4, 38.5, 25.8, 22.8, 18.4, -5.1; HRMS for C₁₆H₂₆OSi, calcd 262.1733, found 262.1743. Anal. Calcd for C₁₆H₂₆OSi: C, 73.22; H, 9.98. Found: C, 72.93; H, 10.25.

tert-Buty[[(E)-3-(1-methylethenyl)-1-bexenyl]oxy]dimethylsilane (2j). Reaction of NiCl₂(pyridine)₄ (5.00 g, 11.2 mmol, 1.00 equiv), sodium (515 mg, 22.4 mmol, 2.00 equiv), 1,5-cyclooctadiene (4.12 mL, 33.6 mmol, 3.00 equiv), (E)-2-hexenal (1.30 mL, 11.2 mmol, 1.00 equiv), *t*-BuMe₂SiCl (1.69 g, 11.2 mmol, 1.00 equiv), and 2-bromopropene (2.98 mL, 33.6 mmol, 3.00 equiv) as per method B (using, however, a 450-W medium-pressure Hg lamp instead of the usual sunlamp and an irradiation time of 24 h) afforded, after chromatography (500 g SiO₂, 98:2 hexane/EtOAc), **2j** (1.69 g, 63%; E:Z > 50:1 after purification, crude E:Z = 17:1) as a clear, colorless oil: 400-MHz ¹H NMR (C_6D_6) & 6.32 (1 H, dd, J = 12.0, 0.76 Hz), 5.11 (1 H, dd, J = 12 Hz, 9.2 Hz), 4.81 (2 H, 2 br s), 2.55 (1 H, m), 1.65 (3 H, s), 1.50-1.20 (4 H, br m), 0.86 (3 H, t, J = 7 Hz), 0.94 (9 H, s), 0.07 (6 H, s); 101-MHz ¹³C NMR (C_6D_6) & 151.27, 148.93, 140.84, 114.82, 109.86, 45.81, 36.15, 25.83, 20.96, 20.12, 18.43, 14.20, -5.12; HRMS for $C_{15}H_{30}OSi$; calcd 254.2050, found 254.2050. Anal. Calcd for $C_{15}H_{30}OSi$: C, 70.80; H, 11.88. Found: C, 70.86; H, 11.59.

tert-Butyldimethyll ((E)-2-methyl-3-phenyl-1-butenyl)oxy silane (2k). Reaction of Ni(COD)₂ (1.00 g, 3.64 mmol, 1.00 equiv), 2-methylbutenal (612 μ L, 7.28 mmol, 2.00 equiv), t-BuMe₂SiCl (713 mg, 4.73 mmol, 1.30 equiv), and bromobenzene (1.15 mL, 10.9 mmol, 3.00 equiv) as per method A afforded, after chromatography (SiO₂, 83 g, 98:2 hexane/EtOAc), 2k (713 mg, 70%; E:Z > 50:1 after purification, crude E:Z = 10:1; crude C(3):C(1) coupling product ratio 4:1) as a clear, colorless oil: 400-MHz ¹H NMR (C₆D₆) δ 7.14 (5 H, br m), 6.33 (1 H, t, J = 1.4 Hz), 3.27 (1 H, q, J = 7.0 Hz), 1.60 (3 H, d, J = 1.4 Hz), 1.30 (3 H, d, J = 7.0 Hz); ¹³C NMR (C₆D₆) δ 145.6, 135.0, 128.5, 127.7, 126.2, 43.2, 25.9, 19.4, 18.4, 11.3, -5.2. HRMS for C₁₇H₂₈OSi: C, 73.85; H, 10.21. Found: C, 73.60; H, 10.04.

4-Phenyl-3-buten-2-ol. 1d (40 mg, 0.13 mmol, 1.0 equiv) and methyl iodide (25 μ L, 0.40 mmol, 3.0 equiv) were reacted according to the procedure given above for the reaction of 1e with 2-iodopropane to afford, after aqueous workup and desilylation (MeOH/K₂CO₃), the title compound as a clear, colorless oil (21 mg, 72%), identified by comparison of its ¹H NMR spectrum with that previously reported.²¹
