#### Received March 2, 1995

Reverse transcriptase (RT) is an essential enzyme for the replication of HIV and thus is regarded as one of the most important targets for anti-HIV agents. So far, only the nucleoside RT inhibitors 3'-azido-3'-deoxythymidine (AZT, Zidovudine), 2',3'-dideoxyinosine (ddI, Didanosine), 2',3'-dideoxycytidine (ddC, Zalcitabine), and 2',3'-didehydro-3'-deoxythymidine (d4T, Stavudine) have been approved for the treatment of HIV-infected patients. However, their long-term use leads to toxic side effects such as bone marrow suppression.<sup>1</sup> In the meantime, non-nucleoside inhibitors, such as 1-[(2hydroxyethoxy)methyl]-6-(phenylthio)thymine (HEPT),<sup>2</sup> dipyridodiazepinone (Nevirapine),<sup>3</sup> and  $\alpha$ -anilinophenylacetamide (R-89439, Loviride),<sup>4</sup> have been found and developed as specific and potent inhibitors of HIV-1 RT. Several of them have proceeded to clinical evaluation.<sup>5</sup>

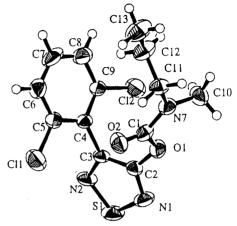

Figure 1. ORTEP drawing of compound 19.

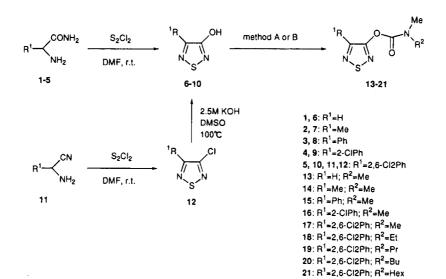

From a random screening program of compounds having herbicidal activities,<sup>6</sup> we identified a series of 1,2,5-thiadiazoles (TDA) as inhibitors of HIV-1. In this communication, we describe the efficient synthesis and the anti-HIV-1 activity as well as the structure-activity relationship of novel non-nucleoside inhibitors having the thiadiazole skeleton.

**Chemistry.** The compounds used in this investigation were synthesized as shown in Scheme 1. The 3-hydroxyl-4-substituted-1,2,5-thiadiazole nucleus was constructed in good yield by condensation of  $\alpha$ -amino acid amides 1-5 with sulfur monochloride in dimethylformamide.<sup>7</sup> Compound 10 could also be synthesized by the hydrolysis of 3-chloro-4-(2,6-dichlorophenyl)-1,2,5-thiadiazole (12) which was prepared from  $\alpha$ -amino- $\alpha$ -(2,6-dichlorophenyl)acetonitrile (11) with sulfur monochloride. The introduction of a carbamoyl moiety at the 3-hydroxy position of the thiadiazole skeleton was achieved using the following two methods: method A. treatment of hydroxythiadiazoles 6-10 with carbamoyl chlorides, and method B, reaction of hydroxythiadiazole with triphosgene followed by treatment with secondary amines giving the carbamates 13-21. Under these reaction conditions, the carbamoyl groups were siteselectively introduced at the 3-hydroxy group (not at the N-2 position), which was confirmed by X-ray crystallography of 4-(2,6-dichlorophenyl)-1,2,5-thiadiazol-3yl N-methyl-N-propylcarbamate (19), as depicted in Figure 1.8

Antiviral Activity and Discussion. MT-4 cells and peripheral blood lymphocytes (PBLs) as cells, HTLV-III<sub>B</sub> strain of HIV-1 and LAV-2<sub>EHO</sub> strain of HIV-2 as viruses were used for the assay. Antiviral activity was based on the inhibition of virus-induced cytophathic effect (CPE) in MT-4 cells or the quantitative detection of HIV-1 p24 antigen in PBLs.<sup>9,10</sup> The number of viable cells was determined by the 3-(4,5-dimethylthiazol-2yl)-2,5-diphenyltetrazolium bromide (MTT) method.<sup>11</sup> Table 1 summarizes the anti-HIV-1 activity and cytotoxicity of the compounds synthesized in this study. 4-Phenyl-1,2,5-thiadiazol-3-yl N,N-dimethylcarbamate (15) exhibited antiviral activity (50% effective concentration (EC<sub>50</sub>) = 23  $\mu$ M). Cytotoxicity was observed at the concentration that was 8-fold higher than the  $EC_{50}$ .

<sup>a</sup> 50% effective concentration based on the inhibition of HIV-1-induced CPE in MT-4 cells or the reduction of p24 antigen in culture supernant of PBLs. <sup>b</sup> 50% cytotoxic concentration based on the reduction of viability of mock-infected cells. <sup>c</sup> Selectivity index: ratio of  $CC_{50}$  to  $EC_{50}$ . All data represent mean values of at least two separate experiments.

The introduction of the chlorine atoms at the 2- or 2,6positions of the phenyl group led to an increase in activity (2-ClPh (16),  $EC_{50} = 0.32 \,\mu M$ ; 2,6-diClPh (17),  $EC_{50} = 0.24 \ \mu M$ ). However, the replacement of the 4-phenyl group in the TDA skeleton by hydrogen (13) or a methyl group (14) resulted in complete loss of activity. 3-Hydroxy-4-(2,6-dichlorophenyl)-1,2,5-thiadiazole (10) was also inactive. These results indicated that the presence of both the aromatic ring at the C-4 position and the carbamate moiety at the C-3 position of the thiadiazole ring was essential. Furthermore, the effect of the alkyl group  $(\mathbf{R}^2)$  in the carbamate moiety was also examined. 4-(2,6-Dichlorophenyl)-1,2,5-thiadiazol-3-yl N-methyl-N-propylcarbamate (19) exhibited the most potent activity; in the MT-4 cells, its  $EC_{50}$  and  $CC_{50}$  values were 0.013 and 131  $\mu$ M, respectively (SI = 10 077). Under the same assay conditions, Nevirapine, Loviride, and AZT displayed EC<sub>50</sub>s of 0.073, 0.006, and  $0.004 \ \mu M$ , respectively.

When 19 was evaluated for its inhibition of HIV-1  $(HTLV-III_B)$  in PBLs, it proved to be extremely potent

<sup>a</sup> The assay procedure has been described previously.<sup>12 b</sup> 50% inhibition concentration. <sup>c</sup> Template-primer used for assay. All data represent mean values of at least two separate experiments. inhibitor (EC<sub>50</sub> = 0.004  $\mu$ M). However, it had no effect on the replication of HIV-2 (LAV-2<sub>EHO</sub>) at concentrations up to 131  $\mu$ M. The effect of compounds 18–20 on recombinant HIV-1 RT (HIV-1 rRT) was examined with poly(rC)-oligo(dG) and poly(rA)-oligo(dT) as the template-primers (Table 2). We found that these compounds inhibited HIV-1 rRT and that the inhibition was dependent on the template-primer used.

In conclusion, we have shown that the TDA derivatives were highly potent and specific inhibitors of HIV-1. Considering that the TDA derivatives are easy to synthesize, they have potential as candidate drugs for the chemotherapy of HIV-1 infections. Our recent studies on their mechanism of action have revealed that the TDA derivatives belong to the family of nonnucleoside HIV-1 RT inhibitors. The investigations on further structure—activity relationships and emergence of drug resistance are now in progress.

Acknowledgment. The strain of HIV-2 (LAV- $2_{EHO}$ ) was provided by L. Montanier (Pasteur Institute, Paris, France), while the HIV-1 (HTLV-III<sub>B</sub>) strain was originally obtained from R. C. Gallo (National Cancer Institute, Bethesda, MD).

Supplementary Material Available: Experimental Procedures, physical and spectral data for compounds 10 and 12– 21, and X-ray crystallographic data for compound 19 (26 pages). Ordering information is given on any current masthead page.
