## Novel Bisnaphthalimidopropyl (BNIPs) derivatives as anticancer compounds targeting DNA in human breast cancer cells

Maria Kopsida<sup>a</sup>, Gemma A. Barron<sup>a, b</sup>, Giovanna Bermano<sup>b</sup>, Paul Kong Thoo Lin<sup>a</sup> and Marie Goua<sup>a</sup>

Bisnaphthalimidopropyl (BNIP) derivatives are a family of compounds that exert anti-cancer activities in vitro and, according to previous studies, variations in the linker sequence have increased their DNA binding and cytotoxic activities. By modifying the linker sequence of Bisnaphthalimidopropyl diaminodicyclohexylmethane (BNIPDaCHM), a previously synthesised BNIP derivative with anti-cancer properties, three novel BNIP derivatives were designed. Bisnaphthalimidopropylpiperidylpropane (BNIPPiProp), a structural isomer of BNIPDaCHM, bisnaphthalimidopropyl ethylenedipiperidine dihydrobromide (BNIPPiEth), an isoform of BNIPDaCHM with a shorter linker chain, and (trans(trans))bisnaphthalimidopropyl diaminodicyclohexylmethane (trans,trans-BNIPDaCHM), a stereoisomer of BNIPDaCHM, were successfully synthesised (72.3-29.5 % yield) and characterised by nuclear magnetic resonance spectroscopy (NMR) and mass spectrometry (MS). Competitive displacement of ethidium bromide (EtBr) and UV binding studies were used to study the interactions of BNIP derivatives with Calf Thymus DNA. The cytotoxicity of these derivatives was assessed against human breast cancer MDA-MB-231 and SKBR-3 cells by MTT assay. Propidium iodide (PI) flow cytometry was conducted in order to evaluate the cellular DNA content in both breast cancer cell lines before and after treatment with BNIPs. The results showed that all novel BNIPs exhibit strong DNA binding properties in vitro, and strong cytotoxicity, with IC50 values in the range of 0.2-3.3 µM after 24 hour drug treatment. Two of the novel BNIP derivatives, BNIPPiEth and trans, trans-BNIPDaCHM, exhibited greater cytotoxicity against the two breast cancer cell lines studied, compared to BNIPDaCHM. By synthesising enantiopures and reducing the length of the linker sequence, the cytotoxicity of the BNIP derivatives was significantly improved compared to BNIPDaCHM, while maintaining DNA binding and bis-intercalating properties. In addition, cell cycle studies indicated that trans,trans-BNIPDaCHM, the most cytotoxic BNIP derivative, induced sub-G1 cell cycle arrest, indicative of apoptotic cell death. Based on these findings, further investigation is under way to assess the potential efficacy of trans, trans-BNIPDaCHM and BNIPPiEth in treating human breast cancer.

Keywords: Bisnaphthalimides, DNA binding, cytotoxicity, cell cycle.

#### Introduction

Breast cancer is the most commonly occurring cancer in women, with incidence rates approaching 1.38 million cases per year worldwide1. Breast cancer, depending on whether it develops in response to the hormone oestrogen, is divided in two categories: oestrogen dependent (ER+) and oestrogen independent (ER-) cancer<sup>2</sup>. ER+

breast cancers respond better to anti-oestrogen (endocrine) therapies, such as tamoxifen and exemestane, by inhibiting the effect of oestrogen and decreasing the uncontrolled proliferation of breast cancer cells<sup>2</sup>. On the other hand, ER- breast cancers are more invasive and less responsive to current standard-of-care treatment regimes, such as fluorouracil, epirubicin and doxorubicin, which do not selectively target breast cancer cells hence leading to severe side effects3. Over the last few decades, there have been numerous attempts to develop novel breast cancer-specific therapies that will act on specific molecular targets, increasing selectivity and potentially reducing treatment resistance and side effects<sup>4</sup>. DNA was one of the first biochemical targets identified in anti-cancer

therapeutics<sup>5, 6, 7</sup>, which lead to a new generation of agents with improved efficacy and solubility. In the 1990's naphthalimido compounds, such as mitonafide, were found for the first time to be highly active against cervical cancer and leukaemia cells, however, a Phase I clinical trial revealed that mitonafide treatment at doses above 118 mg/m<sup>2</sup> ×5 days lead to central nervous system toxicity<sup>8</sup>. Subsequently, bisnaphthalimido compounds were synthesised with improved therapeutic properties. They had also overcome the doselimiting toxicity issues9, however, their aqueous insolubility limited their potential use as anti-cancer agents<sup>10</sup>. Kong Thoo Lin and Pavlov<sup>10</sup> designed and synthesised number of bisnaphthalimidopropyl derivatives, by incorporating natural polyamines and, diamino or triamino alkyl chains into the bisnaphthalimide structure. This led to improved aqueous solubility, as well as anti-cancer activity<sup>11, 12</sup>. Additional alterations to the linker were performed to confirm that BNIP moiety was crucial for in vitro anti-cancer activity. One such alteration was the introduction of a bicyclohexylmethane group (in the linker chain). This tended to reduce the flexibility of the linker but it enhanced its DNA binding properties, resulting in the synthesis of BNIPDaCHM (Figure 1). BNIPDaCHM contained a pseudo-asymmetrical centre with a mixture of three isomers (cis,cis; trans,trans and cis,trans) (indicated by asterisks, Figure 1)13, 14. This linker chain modification resulted in a more cytotoxic BNIP derivative against triple negative breast cancer cells MDA-MB-231 (IC<sub>50</sub> value 6.8 μM), compared to chemotherapy drug doxorubicin (IC<sub>50</sub> value 14.4 μM), after 24 hours treatment<sup>13</sup>. With regards to selectivity, non-tumourigenic breast epithelial MCF-10A cells were found to be less responsive to BNIPDaCHM (IC<sub>50</sub> value 6.06 µM) than doxorubicin 13.

In the present work, we describe for the first time, the synthesis and characterisation of three novel BNIP derivatives that were designed by considering several modifications to the structure of BNIPDaCHM (Figure 1). The first BNIP derivative, bisnaphthalimidopropylpiperidylpropane dihydrobromide (BNIPPiProp) is a structural isomer of BNIPDaCHM that consists of only one species (enantiopure). The aim of synthesising BNIPPiProp was to investigate whether cytotoxicity and DNA binding properties differ among structural isomers and how the position of the ring structure in the linker chain **BNIP** affects cytotoxicity. The second derivative. bisnaphthalimidopropyl- ethylenedipiperidine (BNIPPiEth), consists of one carbon less between the two piperidine ring structures,

compared to BNIPPiProp and was synthesised in order to assess the effect of a shorter linker chain on cytotoxicity and DNA binding properties. In parallel, it is still unknown whether the cytotoxicity of BNIPDaCHM is associated with the existence of the three isomers in structure. therefore (trans(trans))-4,4'-Methylenebis its (cyclohexylamine), the only commercially available stereoisomer precursor required to synthesise trans, trans-BNIPDaCHM the latter being, the third BNIP derivative-used in this study. The synthesis of trans, trans-BNIPDaCHM lead to the investigation into the importance of this stereoisomer compared to the mixture of three stereoisomers present in BNIPDaCHM in relation to DNA binding affinities, cytotoxicity in MDA-MB-231 and SKBR-3 breast cancer cell lines and the possible mode of cell death via cell cycle analysis were studied for the three novel compounds. By using two cell lines which are unresponsive to currently available anti-cancer regimes, it is possible to extend our knowledge on BNIP derivative cytotoxicity against different breast cancer cells types and to gain more information about their mode of action.

#### **Results and discussion**

#### **Chemical synthesis**

The synthesis of bisnaphthalimidopropyl-dipiperidyl-propane and ethane free bases was carried out by reacting 1,3-bis-(4-piperidyl) propane or 1,3-bis-(4-piperidyl)ethane and toluenesulfonyloxypropylnaphthalimide in tetrahydrofuran (THF) under reflux with subsequent addition of cesium carbonate (Scheme 1). The corresponding BNIPPiProp and BNIPPiEth dihydro chloride and bromide salts were prepared by their treatment with HBr/g.CH<sub>3</sub>CO<sub>2</sub>H and conc. HCl (72.3% and 29.5% yield), respectively.

The synthetic strategy of *trans,trans*-BNIPDaCHM (Scheme 2) was based on methods previously developed in our group for the synthesis of BNIPDaCHM<sup>13</sup>. Here the single isomer *trans, trans-4,4'*-methylenebiscyclohexylamine was used as the starting material. The synthesis of *trans,trans*-N<sup>4</sup>,N<sup>4</sup>-dimesityl-dicyclohexylmethane was carried out by reacting *trans,trans-4,4'*-methylenebis(cyclohexylamine), with 2-mesitylenesulfonyl chloride (Mts-Cl) in anhydrous pyridine (21.1% yield). N-Alkylation was

performed by reacting trans, trans-N4, N4-dimesityldicyclohexylmethane with toluenesulfonyloxypropylnaphthalimide in DMF (37.0% yield). For the final step, trans, transbisnaphthalimido-dimesityl-dicyclohexylmethane was dissolved in DCM, followed by treatment with hydrobromic acid/glacial acetic acid (HBr/g.CH<sub>3</sub>CO<sub>2</sub>H). All new compounds were fully characterised by NMR and high resolution mass spectrometry (see experimental section). The melting point of trans, trans-BNIPDaCHM was found to be 120 - 125 °C indicating good purity. In contrast, BNIPDaCHM exhibited a higher melting point range (105 - 130 °C) compared to trans, trans-BNIPDaCHM. BNIPPiProp and BNIPPiEth had melting points in the range of 160 - 170 °C and 120 - 125 °C, respectively, indicating their high purity.

According to matched molecular pair (MMP) analysis, which has been broadly used in the last few years to investigate the effects of hydrogen bond donors/acceptors and rotatable bonds on the melting point of drug-like compounds<sup>15, 16, 17</sup>, has shown that an increase in rotatable bonds leads to a decrease of the melting point<sup>18</sup>. Therefore, the existence of the three isomers on BNIPDaCHM increases its flexibility and leads to a low melting point, compared to the three novel compounds.

ARTICLE Journal Name

On the other hand, BNIPPiProp, with the longest linker sequence, has the highest melting point (160 - 170  $^{\rm o}$ C), due to the increase of hydrogen bond donors/acceptors that stabilize the crystal lattice<sup>18</sup>.

# Competitive displacement of ethidium bromide from *Calf Thymus* DNA

Competitive displacement of ethidium bromide (EtBr) with BNIPs from *Calf Thymus* DNA was carried out to investigate their DNA interactions. EtBr is a well known DNA structural probe and intercalating dye that exerts fluorescence once it binds to DNA<sup>19</sup>. A compound with higher DNA binding affinity than EtBr either displaces EtBr or breaks the DNA secondary structure, resulting in fluorescence quenching and a decrease in fluorescence intensity<sup>20</sup>. All three novel BNIP derivatives competitively displaced EtBr from *Calf Thymus* DNA duplexes. For each derivative, a range of concentrations (0-7  $\mu$ M) were tested and the corresponding C<sub>50</sub> values calculated. All BNIP derivatives displaced EtBr with C<sub>50</sub> values ranging from 1.1 to 5.6  $\mu$ M confirming their high DNA binding affinity (Table 1). BNIPDaCHM was included in the following studies in order to evaluate and compare its binding properties to the novel BNIP derivatives.

The order of their binding affinity to *Calf Thymus* DNA from highest to lowest was BNIPPiEth (1.1  $\pm$  0.2  $\mu$ M), BNIPDaCHM (2.3  $\pm$  0.1  $\mu$ M), BNIPPiProp (3.9  $\pm$  0.3  $\mu$ M) and *trans,trans*-BNIPDaCHM (5.6  $\pm$  0.2  $\mu$ M).

BNIP derivatives	Mean ± SD	
	C <sub>50</sub> value (μM)	
Calf Thymus DNA alone	-	
BNIPDaCHM	2.3±0.1	
BNIPPiProp	3.9±0.3 *	
BNIPPiEth	1.1±0.2 *	
trans,trans-BNIPDaCHM	5.6±0.2 **	

Table 1. Competitive displacement of EtBr from *Calf Thymus* DNA. Effect of different BNIP concentrations (0-7  $\mu$ M) on % fluorescence intensity compared to *Calf Thymus* DNA alone. C<sub>50</sub> value: concentration of each BNIP derivative required to cause a 50% decrease on fluorescence intensity of DNA-EtBr complex. Data are the mean  $\pm$  SD of three independent experiments (n=3). \*P<0.05, \*\*P<0.01, compared to BNIPDaCHM.

BNIPPiEth, which has the shortest linker with two piperidine rings attached to an ethyl group, had the lowest  $C_{50}^{\text{lo}: 10.1039/C6OB01850E}$  length of the linker chain, as well as the incorporation of a nitrogen atom within the cyclohexane ring, compared to BNIPDaCHM, resulted in increased DNA binding. On the other hand, the incorporation of the nitrogen atom within the cyclohexane ring was not found to improve the binding properties of BNIPPiProp (3.9  $\pm$  0.3  $\mu$ M), compared to BNIPDaCHM and BNIPPiEth, confirming that the length of the bridging alkyl linkers is crucial and affects significantly BNIP binding to DNA duplexes<sup>21</sup>.

The trans, trans-BNIPDaCHM, a stereoisomer of BNIPDaCHM, gave a  $C_{50}$  value of 5.6  $\pm$  0.2  $\mu$ M. BNIPDaCHM, which consists of three isomers, gave a  $C_{50}$  value of 2.3  $\pm$  0.1  $\mu$ M, which indicated that in absence of cis,cis or/and cis,trans, trans,trans-BNIPDaCHM was not able to achieve as high DNA-binding interactions as BNIPDaCHM. Based on the above results, the planar structure of BNIPDaCHM and its mixture of three isomers was found to improve its interacting properties within the DNA base pairs, compared to trans, trans-BNIPDaCHM. This was confirmed since trans, trans-BNIPDaCHM resulted in a lower C<sub>50</sub> value compared to BNIPDaCHM, revealing that each of the three or more than one (trans,trans/cis,trans or trans,trans/cis,cis) isomers co-existing in BNIPDaCHM, are involved in the intramolecular complexes/interactions with DNA. By isolating one of its isomers (trans, trans-BNIPDaCHM), the DNA binding affinity was decreased (p<0.01). The planar structure of BNIPDaCHM allows it to fit between the base pairs and in parallel, its rotational freedom within the plane of the aromatic rings, may allow the exposure of more than one intercalating sidechain to DNA<sup>22</sup>.

#### **UV** binding studies

The binding of the novel BNIP derivatives with *Calf Thymus* DNA was also studied by UV spectroscopy. A continuous decrease in UV absorption was observed at 260 nm, within the range of drug concentrations (0 -  $7\mu$ M) investigated. The apparent binding constants for the compounds under study, were calculated from the intercept and the slope by plotting A0/ (A-A0) against BNIP derivative concentrations<sup>23</sup>, where A0 and A correspond to the absorbance values in the absence and presence of each BNIP compound (Figure 2a), respectively. Binding constant values K for the BNIP derivatives range between  $3.25 \times 10^4$  -  $12.23 \times 10^4$  (Figure 2b), and indicate that all BNIP derivatives interact with the DNA helix. The highest binding

BNIP derivatives	K constant
BNIPDaCHM	12.2 x 10 <sup>4</sup>
BNIPPiProp	3.3 x 10 <sup>4</sup>
BNIPPiEth	10.9 x 10 <sup>4</sup>
trans,trans-BNIPDaCHM	11.4 x 10 <sup>4</sup>

Figure 2.a) Competitive displacement of EtBr from Calf Thymus DNA. Plot of AO/ (A-AO) versus 1/CBNIP of the interaction between BNIP derivatives and Calf Thymus DNA. b) K constant values of BNIPP derivatives after UV binding studies.

constant was observed with BNIPDaCHM(12.23 x 104), followed by trans,trans-BNIPDaCHM (11.38 x 104) and BNIPPiEth (10.85 x 104). The lowest K binding constant was observed for BNIPPiProp (3.25 x 104). This outcome is in agreement with the competitive displacement of EtBr studies (Table 1), highlighting the importance of linker chain length in achieving strong DNA binding interactions. In addition, the UV absorption studies revealed that trans, trans-BNIPDaCHM, the less effective derivative in displacing EtBr from DNA, obtained a high binding constant (11.38 x 104), compared to BNIPDaCHM (12.23 x 104: highest K binding constant). This suggests that trans, trans-BNIPDaCHM exhibits lower intercalation capacity than the other two isomers present in the BNIPDaCHM. However, the trans, trans isomer has similar DNA affinity to the mixture of isomers present in BNIPDaCHM as demonstrated by their binding constant (Figure 2b). Previous molecular modelling studies have revealed that for the most stable conformation of bis-1,8naphthalimide in presence of DNA, the naphthalimide rings obtain an antiparallel orientation and are detected in the major groove<sup>24</sup>.

Furthermore, they have been reported to induce strand, cleavage, allowing the electron transfer and formation of hydrogen bonding between the nitrogen atoms and the nucleobases (excluding guanine) of the minor groove25, suggesting that the high K binding constant of trans, trans-BNIPDaCHM is obtained not only via intercalation, but also via binding on the major and minor groove of DNA.

#### **Biological studies**

#### Cytotoxicity

Cytotoxicity evaluation of BNIPDaCHM, BNIPPiProp, BNIPPiEth and trans, trans-BNIPDaCHM was performed by using MTT assay<sup>26</sup> against MDA-MB-231 and SKBR-3 cells (Table 2). After 24 hours treatment, all novel BNIP derivatives, exhibited strong cytotoxicity with IC50 values ranging from 1.4 μM to 3.3 μM in MDA-MB-231 cells (Table 2), compared to previously synthesised BNIPs or DNA intercalating drugs (doxorubicin) that have been tested against the same cell line, with IC<sub>50</sub> values ranging from 4.9 μM to 12.7 μM<sup>13</sup>. In particular, trans,trans-BNIPDaCHM exhibited the lowest IC<sub>50</sub> value of 1.4 μM, BNIPPiEth an IC50 of 1.8  $\mu M$  and BNIPPiProp an IC50 of 3.3  $\mu M$ . A similar pattern of cytotoxicity was found for SKBR-3 cells, although the IC<sub>50</sub> values were between 0.2 - 0.7  $\mu$ M (Table 2).

BNIP derivatives	IC values (μM) (Mean ± SEM)	
	MDA-MB-231	SKBR-3
BNIPDaCHM	2.3± 0.1	0.4±0.1
BNIPPiProp	3.3± 0.1 **	0.7±0.1 *
BNIPPiEth	1.8±0.1 *	0.3±0.1 *
trans,trans-BNIPDaCHM	1.4± 0.1 **	0.2±0.0 *

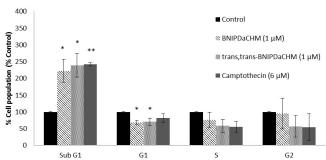

Table 2. Cytotoxicity of BNIP derivatives against MDA-MB-231 and SKBR-3 cells. MDA-MB-231 and SKBR-3 cells were treated with different BNIP concentrations (0-10 μM) for 24 hours at 37 °C. IC<sub>50</sub> values correspond to the concentration required to reduce cell growth by 50% compared to control cells. Data presented as mean ± SEM of 3 independent experiments (n=3). \*P<0.05, \*\*P<0.01, compared to BNIPDaCHM.

trans,trans-BNIPDaCHM (1.4 µM) was more active (p<0.01) than BNIPDaCHM (2.3 µM) against MDA-MB-231 cells, showing that the existence of a single isomer in the linker sequence results in a more

An increase in the proportion of MDA-MB-231 cells in sub-G1 phase (122.3%, 139.3% and 142.2% increase, respectively) was exhibited relative to the control, whilst in G1 phase, the cell population was decreased after treatment with BNIPDaCHM (1µM) and trans, transBNIPDaCHM (1μM) (31.3% and 29.4% decrease, both p<0.05) (Figure 3a). The above results indicate that both BNIPDaCHM and trans, trans-BNIPDaCHM induced sub-G1 cell cycle arrest to a greater extent than camptothecin. Camptothecin is a well known positive control for sub-G1 arrest<sup>30, 31</sup> and for inducing apoptosis<sup>32, 33</sup>.

Therefore, this suggests that BNIPDaCHM and trans, trans-BNIPDaCHM could use similar mechanisms of action compared to camptothecin and may trigger apoptotic cell death in MDA-MB-231

September 2016.

Published on 21

4,4-Ethylenedipiperidine dihydrochloride (7.428x10<sup>-4</sup> mol, 0.2 g) was dissolved in distilled water (2 mL), Sodium hydroxide (2 M, 1 mL) was added, which resulted in the formation of a precipitate. The pH was 14. The resulting was transferred into a separating funnel (100 mL) followed by extraction with DCM (300 mL). The organic layer was collected, dried with sodium sulfate and filtered. The solvent was evaporated by a rotary film evaporator. The final white solid product was left to dry under negative pressure in a vacuum oven at 45°C for 30 minutes (90.6% yield). The synthesis of the free base was confirmed by <sup>1</sup>H-NMR.

 $^1$ H-NMR (CDCl<sub>3</sub>): δ 2.98 – 2.95 (2H, CH<sub>2</sub> protons), 2.52 – 2.45 (2H, CH<sub>2</sub> protons), 1.8 (NH), 1.60 – 1.57 (2H, CH<sub>2</sub> protons), 1.25 – 1.21 (H, CH protons) and 1.19 – 1.16 (2H, CH<sub>2</sub> protons) ppm.

#### Synthesis of BNIPPiEth base

4,4 Ethylenedipiperidine (5.044 x10<sup>-4</sup> mol, 0.1 g) was reacted with toluenesulfonyloxypropyl-naphthalamide (1.001 x10<sup>-3</sup> mol, 0.41 g, 2.01 excess). Caesium carbonate (3.069 x10<sup>-3</sup> mol, 1 g) was added in the reaction. All the reagents were dissolved in THF (6 mL) and the solution refluxed overnight at 60°C. The reaction was monitored using TLC. Once the reaction was complete, the solution was poured into icy water (100 mL), which resulting in the formation of a precipitate. The precipitate was filtered using a Buchner funnel and the product was left to dry under negative pressure in a vacuum oven at 45°C for 60 minutes (72.3% yield). The crude product was recrystallised from ethanol and the pure product was characterised by  $^1\text{H-NMR}$ .

 $^{1}$ H-NMR (CDCl<sub>3</sub>):  $\delta$ H 8.52 – 8.50 (2H, CH aromatic protons),  $^{2}$ L(8 - 13):  $^{1}$ R-10.1039/C6OB01850E 8.11 (2H, CH aromatic protons),  $^{2}$ R-10.1039/C6OB01850E protons),  $^{2}$ R-10.1039

#### Synthesis of BNIPPiEth

BNIPPiEth (0.1 g) was dissolved in DCM (20 mL). Then, conc. HCl (1.5 mL) was added dropwise and the solution stirred at room temperature for 60 minutes, which resulted in the formation of a pale, blue precipitate. The latter was filtered and washed with ether (50 mL) and afterwards with ethanol (50 mL). The product was left under negative pressure in a vacuum oven at 45 °C for 60 minutes (29.5% yield).

 $^{1}$ H-NMR (CDCl<sub>3</sub>): δH 8.42 – 8.38 (2H, CH aromatic protons), 7,82 – 7.78 (2H, CH aromatic protons), 4.05 – 4.01 (2H, CH<sub>2</sub> protons), 2.7 (2H, CH<sub>2</sub> protons), 2.44 – 2.43 (2H, CH<sub>2</sub> protons), 2.05 (2H, CH<sub>2</sub> protons), 1.70-1.67 (2H, CH<sub>2</sub> protons), 1.35-1.32 (H, CH protons) and 1.090 (2H, CH<sub>2</sub> protons) ppm.

 $^{13}\text{C-NMR}$  (CDCl<sub>3</sub>):  $\delta\text{H}$  164.10 (C=O), 134.81 (CH aromatic), 131.76 (C aromatic), 131.18 (CH aromatic), 127.92 (C aromatic), 127.68 (CH aromatic), 122.59 (C aromatic), 55.40 (CH<sub>2</sub>), 52.27 (CH<sub>2</sub>), 37.79 (CH), 29.43 (CH<sub>2</sub>) 23.04 (CH<sub>2</sub>) and 22.54 (CH<sub>2</sub>) ppm.

Mass spectrum (HRMS), m/z = 671.5372 (M + H)<sup>+</sup> C<sub>42</sub>H<sub>46</sub>N<sub>4</sub>O<sub>4</sub> requires 671.3592 (M + H)<sup>+</sup>.

#### Synthesis of N-(3-hydroxypropyl)naphthalimide

1,8-naphthalic anhydride (0.050 mol, 10 g) was dissolved in dimethylformamide (DMF) (140 mL). Once the 1,8-naphthalic anhydride was totally dissolved, 3-amino-1-propanol (0.050 mol, 3.75 g) and 1,8-diazabicylo[5.4.0]undec-7-ene (DBU) (13 mL) were added. The reaction was left to stir for 5 hours at 85°C. Reaction completion was monitored with TLC and once completed; the solution was poured into icy water (200 mL) while stirring with a glass rod to form a precipitate. The precipitate was filtered and washed with water. The pure product was characterised using ¹H-NMR. Yield was calculated as: 53.9%.

 $^{1}$ H-NMR (CDCl<sub>3</sub>): δH 8.66 - 8.63 (2H, aromatic H, doublet, J=7.2 Hz), 8.29 - 8.25 (2H, aromatic H, doublet, J=8.4 Hz), 7.83 - 7.78 (2H, aromatic H, doublet, J=8.0 Hz), 4.41-4.38 (3H, triplet, J=5.6 Hz), 3.64-3.59 (2H, CH<sub>2</sub>, multiplet) 3.23 (OH, singlet) and 2.06 - 2.00 (2H, CH<sub>2</sub> multiplet) ppm.

#### Synthesis of toluenesulfonyloxypropylnaphthalimide

N-(3-hydropropyl)naphthalimide (0.0196 mol, 5.0 g) was dissolved in anhydrous pyridine (70 mL), whilst stirring on ice. Once the N-(3-hydroxypropyl)naphthalimide was completely dissolved, p-toluenesulfonyl chloride (Ts-Cl) (0.0394 mol, 7.51 g, 2.01 excess) was slowly added to the reaction. The reaction was left at 4°C overnight. The reaction was monitored using TLC and once it was complete, the solution was poured into icy water (200 mL) to form a precipitate which was filtered and washed thoroughly with water. The crude product was recrystallised from ethanol (68.2% yield).

 $^{1}$ H-NMR (CDCl<sub>3</sub>):  $\delta$ H 8.59 - 8.57 (2H, aromatic H, doublet, 8.2 Hz), 8.25 - 8.23 (2H, aromatic H, triplet, 7.2 Hz), 7.81 - 7.76 (2H, multiplet), 7.30 (2H, aromatic H, doublet, 1.2 Hz), 4.27-4.20 (2H, CH<sub>2</sub>, multiplet), 2.44 (3H, CH<sub>3</sub>, singlet) and 2.19 - 2.12 (2H, CH<sub>2</sub>, multiplet) ppm.

#### Synthesis of N4,N4-dimesityl-dicyclohexylmethane

September 2016.

Published on 21

4,4'-methylenebis(cyclohexylamine) (4.75x10<sup>-3</sup> mol, 1.0 g) was dissolved in anhydrous pyridine (10 mL) and left to stir for 15 minutes. 2-mesitylenesulfonyl chloride (Mts-Cl) (9.56x10-3 mol; 2.1 g) was added. The reaction was left to stir overnight at room temperature and TLC confirmed completion of reaction. The solution was poured into icy water (150 mL) with the formation of a precipitate. The latter was filtered by vacuum filtration, left to dry in a vacuum oven set at 45°C for 24 hours (43.3% yield).

 $^{1}$ H-NMR (CDCl<sub>3</sub>):  $\delta$ H 7.30 (NH), 6.97 (4H, CH aromatic protons), 2.99 (4H, CH protons), 2.67-2.66 (6H, CH<sub>3</sub>-Mts protons) and 1.73-1.49 (CH<sub>2</sub> and cyclohexane protons) ppm.

#### Synthesis of protected bisnaphthalimido-dimesityldicyclohexylmethane

 $N^4,N^4$ -dimesityl-dicyclohexylmethane (6.968x10<sup>-4</sup> mol, 0.4 g) and toluenesulfonyloxypropylnaphthalimide (1.400x10<sup>-3</sup> mol, 2.01

excess) were dissolved in DMF (8 mL). Afterwards, excess, of caesium carbonate (1.13 g, 3.5x10<sup>-3</sup> mol, 2.5 g excess) was added slowly. The reaction was left to stir for 48 hours at 60°C. After TLC confirmed the reaction was complete, the solution was poured into icy water (150 mL) to form a precipitate. After vacuum filtration and several washes with water, the product was left to dry under negative filtration in a vacuum oven at 45°C for 3 hours (92.2 % yield). The product was recrystallised from ethanol and characterised by NMR.

 $^{1}$ H-NMR (CDCl<sub>3</sub>):  $\delta$ H 8.50 – 8.47 (2H, aromatic H), 8.18 – 8.15 (2H, aromatic H), 7.72 – 7.67 (2H, aromatic H), , 6.87 (2H, CH-Mts H), 6.55 – 6.53 (2H, CH-Mts H), 3.94 – 3.92 (2H, CH<sub>2</sub>), 3.12 – 3.10 (2H, CH<sub>2</sub>), 2.87-2.80 (2H, CH<sub>2</sub>), 2.35-2.32 (3H, CH<sub>3</sub>), 2.05-2.04 (3H, CH<sub>3</sub>), 1.61-1.58 (H, CH), 1.61 (2H, CH<sub>2</sub>) 1.49-1.37 (2H, CH) and 1.04 (2H, CH<sub>2</sub>) ppm.

<sup>13</sup>C-NMR (CDCl<sub>3</sub>): δH 163.87-162.76 (C=O), 134.36 (C aromatic), 131.40-130.74 (C aromatic), 127.75 (C aromatic), 35.75 (CH<sub>2</sub>), 30.41 (CH<sub>2</sub>), 21.97 (CH<sub>3</sub>) and 20.32 (CH<sub>3</sub>) ppm.

#### Synthesis of bisnaphthalimidopropyl-diaminodicyclohexylmethane dihydro-bromide salt

Bisnaphthalimido-dimesityl-dicyclohexylmethane (3.813x10 $^{-4}$  mol, 0.4 g) was dissolved in dichloromethane (DCM) (8 mL). Afterwards, hydrobromic acid/glacial acetic acid (HBr/CH $_3$ CO $_2$ H) (1 mL) was added drop wise. The reaction was stirred overnight at room temperature. TLC was used to confirm that the reaction was complete. The precipitate formed, was filtered by vacuum filtration and washed with DCM (15 mL) and ether (5 mL). The final product was dried under negative pressure in a vacuum oven set at 45°C for 3 hours (37.5% yield).

 $^{1}$ H-NMR (CDCl<sub>3</sub>):  $\delta$ H 8.32 – 8.25 (2H, aromatic Hs), 7.73 – 7.65 (2H, aromatic Hs), 3.70 – 3.64 (2H, CH<sub>2</sub> protons), 3.13 (2H, CH<sub>2</sub> protons), 2.90-2.30 (3H, CH<sub>3</sub> protons), 2.09-2.02 (3H, CH<sub>3</sub> protons), 1.83-1.80 (H, CH proton), 1.43-1.33 (2H, CH<sub>2</sub> protons) ppm.

 $^{13}$ C-NMR(CDCl<sub>3</sub>):  $\delta$  163.87-162.76 (C=O), 134.36 (C aromatic), 131.40-130.74 (C aromatic), 127.75 (C aromatic), 35.75 (CH<sub>2</sub>) and 30.41 (CH<sub>2</sub>) ppm.

Mass spectrum (HRMS), m/z = 685.3764 (M + H)<sup>+</sup> C<sub>43</sub>H<sub>48</sub>N<sub>4</sub>O<sub>4</sub> requires 685.3748 (M + H)<sup>+</sup>.

#### Synthesis of trans, trans-N<sup>4</sup>, N<sup>4</sup>-dimesityl-dicyclohexylmethane

trans, trans-4,4'-methylenebis (cyclohexylamine) (2.38x10<sup>-4</sup> mol, 0.05 g) was added in anhydrous pyridine (1.5 mL) and left to stir for 15 minutes with warming. After dissolution, 2mesitylenesulfonyl chloride (Mts) (4.76x10<sup>-4</sup> mol; 0.10 g) was added. The reaction was left to stir overnight at room temperature and TLC confirmed reaction completion. The solution was poured into icy water (10 mL) and stirred with a glass rod until the formation of a precipitate. The suspension was centrifuged and was washed 3 times with distilled water and the precipitate was left to dry under negative pressure in a vacuum oven set at 45°C for overnight (21% yield). The product was afterwards characterised by 1H-NMR.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): δH 7.31 (NH), 6.98 (4H, CH aromatic protons), 3.87 (4H, CH protons), 2.67 (6H, CH<sub>3</sub>-Mts protons), 2.33 (3H, CH<sub>3</sub>-Mts protons), 1.84-1.82 (CH<sub>2</sub>-cyclohexane ring), 1.65-1.62 (CH<sub>2</sub>cyclohexane ring), 1.16-1.10 (CH-cyclohexane ring) and 0.99-0.95 (CH<sub>2</sub> cyclohexane protons) ppm.

#### Synthesis of protected trans, trans-bisnaphthalimidopropyl dimesityl-dicyclohexylmethane

trans, trans-N4, N4-dimesityl-dicyclohexylmethane (6.44x10<sup>-5</sup> mol, 0.037 g) and toluenesulfonyloxypropylnaphthalimide (1.29x10<sup>-4</sup> mol, 0.053 g, 2.01 excess) were dissolved in DMF (1 mL). Afterwards, excess of caesium carbonate ( $n = 3.07x10^{-4}$  mol, 0.1 g, 5.0 excess) was added slowly. The reaction was left to stir for 48 hours at 60°C. After TLC confirmed the reaction was complete, the solution was poured into icy water (10 mL) to form a precipitate. The suspension was centrifuged and was washed twice with distilled water. The product was left to dry under negative pressure? in a vacuum oven at 45°C for 24 hours. The crude product (59 mg, 88% yield) was purified using column chromatography and the final product (25 mg, 37% yield) was characterised by <sup>1</sup>H-NMR.

 $^{1}$ H-NMR (CDCl<sub>3</sub>): δH 8.65 – 8.59 (2H, CH aromatic protons), 8.30 – 8.25 (2H, CH aromatic protons), 7.84 - 7.78 (2H, CH aromatic protons), 6.65 - (4H, CH-Mts protons), 4.41 - 4.38 (2H, CH<sub>2</sub> protons), 4.06 - 4.04 (2H, CH<sub>2</sub> protons), 3.71-3.68 (2H, CH<sub>2</sub> protons), 2.68 (3H, CH<sub>3</sub> protons), 2.46-2.44 (3H, CH<sub>3</sub> protons),

2.34 (H, CH protons), 2.16-2.15 (2H,CH<sub>2</sub> protons) 1.84 (2H, CH protons) and 1.73-1.71 (2H,  $\text{CH}_2$  protons) ppm.  $^{13}$ C-NMR (CDCl<sub>3</sub>):  $\delta$ H 141.93(C=O), 138.76 (C aromatic), 135.17 (C aromatic), 131.95 (C aromatic), 43.72 (CH<sub>2</sub>), 33.93-31.99 (CH<sub>2</sub>), 23.02 (CH<sub>3</sub>) and 20.97 (CH<sub>3</sub>) ppm.

#### Synthesis of trans, trans-bisnaphthalimidopropyl-diaminodicyclohexylmethane dihydro-bromide salt

trans, trans-bisnaphthalimido-dimesityl-dicyclohexylmethane (2.38x10<sup>-5</sup> mol, 25mg) was dissolved in dichloromethane (DCM) (1.0 mL). Afterwards, hydrobromic acid/glacial acetic acid (HBr/CH<sub>3</sub>CO<sub>2</sub>H) (0.2mL) was added slowly. The reaction was stirred overnight at room temperature. TLC was used to confirm that the reaction was complete. The suspension formed was transferred to Eppendorf tubes and centrifuged, was with DCM (1.0 mL) and ether (1.0 mL). The final product was dried under negative pressure in a vacuum oven set at 45°C for 3 hours to give the product as a white solid (8.3 mg, 41% yield).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>):  $\delta$  8.53 – 8.49 (2H, CH aromatic protons), 4.16 – 4.12 (2H, CH aromatic protons), 3.42 (2H, CH aromatic protons) 3.04 (2H, CH<sub>2</sub> protons), 2.94 (2H, CH<sub>2</sub> protons), 2.51-2.49 (3H, CH<sub>3</sub> protons), 2.09-1.99 (3H, CH<sub>3</sub> protons), 1.75-1.72 (H, CH proton), 1.31-1.28 (2H, CH<sub>2</sub> protons) ppm.

<sup>13</sup>C-NMR(CDCl<sub>3</sub>):  $\delta$  164.26 (C=O), 131.82-131.23 (C aromatic), 127.99-127.75 (C aromatic), 122.66 (C aromatic), 42.45 (CH<sub>2</sub>) and 40.61-37.61 (CH<sub>2</sub>) ppm.

Mass spectrum (HRMS),  $m/z = 685.3732 \text{ (M + H)}^{+} \text{ C}_{43}\text{H}_{48}\text{N}_{4}\text{O}_{4}$ requires 685.3748 (M + H)+.

#### Ethidium Bromide (EtBr) Fluorescence Displacement studies

BNIPDaCHM, BNIPPiProp, BNIPPiEth and trans, trans-BNIPDaCHM working solutions (100 μM) were prepared from stock solutions (10 mM in 50% DMSO/ $H_20$ ) and were further diluted to a final concentration of 50 µM in 0.01 M saline sodium citrate (SSC) buffer. Calf Thymus DNA (0.5 g) was dissolved in 0.01 M SSC buffer (100 mL). EtBr solution (200 μM) was prepared by dissolving 3.94 mg of EtBr in distilled water (50 mL) and was further diluted in 0.01 SSC buffer to give the final concentration of 20  $\mu$ M. Test solutions were prepared by adding varying volumes of SSC buffer, Calf Thymus DNA solution, EtBr solution and BNIP derivative solution. The final solutions were thoroughly mixed and analysed

ARTICLE

at 510 nm (excitation) and 520 nm (emission) using a Shimadzu RF-5301 spectrophotometer. The  $C_{50}$  values were determined as the concentration ( $\mu M$ ) required to decrease the fluorescence of

DNA bound EtBr by 50%.

#### **UV** binding studies

September 2016.

BNIPDaCHM, BNIPPiProp, BNIPPiEth and BNIPDaCHM working solutions (100  $\mu$ M) were prepared from their stock solutions (10 mM) as before, and were further diluted to 20  $\mu$ M final concentration in 0.01 M SSC buffer. *Calf Thymus* DNA and 0.01 SSC buffer were prepared as described before (EtBr Fluorescence Displacement studies). Test solutions were prepared by adding *Calf Thymus* DNA solution (1 mL) in a quartz cuvette and BNIP derivative solution (100  $\mu$ L) was added. The final solutions were thoroughly mixed and analysed at 260 nm using an Agilent 8453 UV-visible spectrophotometer. The values of apparent binding constants (K) were calculated from the intercept and slope by plotting A0/ (A-A0) against the BNIP derivative concentrations, where A0 and A correspond to the absorbance values in absence and presence of a compound.

#### Cell culture maintenance

MDA-MB-231 (ECACC, Public Health England, UK, 92020424) and SKBR-3 (ATCC, HTB-30) cells were maintained in Roswell Park Memorial Institute 1640 medium (RPMI-1640) (containing GlutaMAX-1 with 25 mM HEPES), supplemented with 10% (v/v) Fetal Bovine Serum (FBS) and 1% Penicillin/Streptomycin (10,000  $\mu$ g/mL). Cells were grown at 37°C (5% CO<sub>2</sub>).

#### Cytotoxicity

Colourimetric 3-(4, 5-Dimethylthiazol-2-yl)-2, 5-diphenyltetrazodium bromide (MTT) assay was performed to access the growth/inhibitory effects of each BNIP compound. MDA-MB-231 and SKBR-3 cells (7.5 x  $10^3$  cells/100  $\mu$ L) were treated with different concentrations (0-10  $\mu$ M) of BNIP derivatives. After 24 hour treatment, sterile-filtered MTT solution (1 mg/mL) was added to each well. After 4 hour incubation at 37 °C, the MTT solution was removed and formazan crystals solubilised in DMSO. The plates were shaken for 20 minutes at room temperature and absorbance measured at 560 nm (Synergy/HT, BIOTEK, UK). For each compound, three independent experiments were carried out and each treatment

consisted of six replicates per plate. Curves were a used in the represent the percentage growth inhibition of MDA-MB-231 and SKBR-3 cells treated with BNIP derivatives, compared to DMSO/ $\rm H_2O$  control that represented 100% cell viability. IC values were defined as the drug concentration that reduces absorbance compared to control values by 50%.

#### Cell cycle analysis

MDA-MB-231 and SKBR-3 cells (1 x 10<sup>6</sup> cells per T75 flask) cells were washed with PBS and serum free medium added in the flasks in order to achieve cell synchrony. The cells were incubated in serum free medium for 24 hours. BNIP derivatives (IC<sub>25</sub> concentrations) were added and incubated for 24 hours, at 37°C. After 24 hours treatment, the medium was removed and collected. The cells were washed twice with PBS. Both washes were collected and the cells trypsinised, mixed with the collected washes and centrifuged at 2,500 rpm for 5 minutes at 4°C. The supernatant of each sample was discarded, the pellet was resuspended in PBS (1 mL) and centrifuged at 2,500 rpm for 5 minutes at 4°C, the supernatant was discarded and the pellet resuspended in PBS (100 μL). Then, 70% (v/v) ice-cold ethanol (900 μL) was added and samples incubated for 2 hours at -20°C. The cells were centrifuged at 5,000 rpm for 5 minutes at 4°C, the supernatant was discarded and the pellet resuspended in PBS (1 mL), followed by re-centrifugation at 5,000 rpm for 5 minutes at 4 °C. The supernatant was discarded once more and the pellet resuspended in PBS (500 µL) and DNA extraction buffer (0.2 M Na<sub>2</sub>HPO<sub>4</sub>, 4 mM citric acid, pH 7.8, 500 μL) and incubated for 5 minutes at room temperature. The extracts were centrifuged at 5,000 rpm for 5 minutes at 4 °C, the supernatant was removed and the pellets were resuspended in DNA staining solution (0.2 mg/mL Ribonuclease A (DNAse-free) and 20 μg/mL propidium iodide (PI) in PBS). The samples were incubated for 30 minutes at 4°C in the dark and PI nuclei were examined by flow cytometry (EXPO32 ADC XL 4 color, Beckman Coulter, UK). For cell cycle analysis, EXPO32 ADC analysis software (Beckman Coulter, UK) was used to record and analyse 10,000 single events. The percentage of cells with DNA content in sub-G<sub>1</sub>, G<sub>1</sub>, S and G<sub>2</sub>/M phases was calculated from histograms of linear FL-2 plots (575 nm) in the gated region.

ARTICLE Journal Name

#### **Statistics**

Three independent experiments were conducted and each experiment was comprised of at least two internal replicates. Data are presented as mean  $\pm$  SD or mean  $\pm$  SEM. Statistical analysis was performed by using an unpaired Student's  $\pm$ -test. Statistically significant data were detailed when P<0.05).
