α -Phthalimide ketones

ABSTRACT

The 'one pot' condensation reaction for the synthesis and potent antiproliferative inhibition of α -phthalimide based ketones is reported here. 2-Phthalimide-1-(4-fluoro-phenyl)ethanone (**5**) showed the best growth inhibition on human MDAMB-231 breast carcinoma and SKHep-1 hepatoma cell lines. Preliminary studies showed that the reported bioactivity may be due to the presence of strong electronegative fluorine group at the *para*-position of the aryl ring.

1. Introduction

Phthalimide-containing compounds have attracted attention for scientists [1–8], and reports showed that they possess anti-inflammatory [2,3], histone deacetylase inhibitory [4], liver X receptor (LXR) antagonistic [5], leukotriene D₄ receptor antagonistic [6] and their angiogenesis inhibitor [7] activities. Ketones, such as nitrogen-containing heterocyclic ketones, are effective for prophylaxis and treatment of HGF mediated diseases [9]. Zheng and his coworkers reported that phthalimide ketones can potentially be employed as substrates for producing chiral primary amino alcohols [10–12]; however, no biological activity was available for this type of compounds. Our group previously reported that the phthalimide substituted benzothiazole **1** (Fig. 1) [13,14] showed important activity against CA46, K-562 and SKHep-1 human cancer cells. Based on the design rationale of compound **1**, we turn our

focus in searching for more leads using phthalimide as a structural basis for further studies. As part of our on-going work at the synthesis and activity evaluation of anti-tumor candidates, we herein firstly reported the biological activities of several easily available phthalimide ketones, which have not been reported so far.

2. Chemistry

α -Phthalimide ketone **2** was synthesized by the condensation of α -bromoketone and potassium phthalimide, where further purification can be easily achieved by recrystallization in ethanol. All reagents, such as α -bromoketone, potassium phthalimide, DMF and ethanol were used directly without any purification or predrying, and the reaction can proceed at room temperature. To confirm the chemical structures of the α -phthalimide ketones, we have performed the ¹H NMR spectrum, ¹³C NMR spectrum and mass spectrometry analysis.

3. Pharmacology

The human breast cancer cell line MDAMB-231 and the hepatoma SKHep-1 were initially selected for the purpose of preliminary

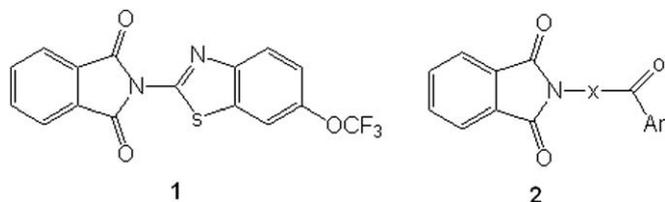

Fig. 1. Phthalimide derivatives: (a) naphthalimide benzothiazole **1**; (b) α -phthalimide ketone **2**.

anticancer screening of these compounds. As shown in Fig. 2, all of our five α -phthalimide ketones at an initial testing concentration from 176 μ M to 179 μ M showed growth inhibitory activity towards the two human cancer cell lines tested.

Of those compounds tested, both compounds **4** (179 μ M) and **5** (177 μ M) showed a significant growth inhibitory and cytotoxicity on MDAMB-231 and SKHep-1 human carcinoma cells. The percentage of growth inhibition of both compounds on these cancer cell lines was more than a mean value of 50%. When considering MDAMB-231 breast cancer cells, their degree of growth inhibition was comparable to cisplatin (167 μ M) while for SKHep-1 hepatoma cells, cisplatin showed a better cytotoxic activity. Compound **3** (179 μ M) showed a better cytotoxic potential than compound **6** (176 μ M). Compound **7** (179 μ M) was the weakest among these series (Fig. 2). We also demonstrated that compounds **4** and **5** exhibited a dose dependent antiproliferative effect on both MDAMB-231 and SKHep-1 cancer cells (Figs. 3 and 4).

Further morphological investigations showed that both compounds **4** and **5** could induce cell rounding and cell shrinkage on both MDAMB-231 breast cancer cells and SKHep-1 hepatoma cells (Fig. 5). These indicated that both compounds could readily induce cancer cell death on these two cancer cell lines. The significant inhibitory activity of compound **5** may due to the presence of strong electronegative fluorine group at the *para*-position of the aryl ring. The steric effect appears not significant to account for the activity when we compared the activity of compound **6** or **4** against the activity of compound **3**. Further

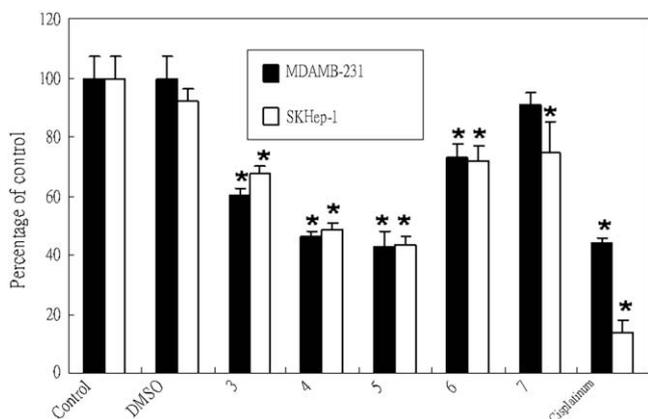

Fig. 2. Growth inhibitory activity of α -phthalimide ketones on MDAMB-231 and SKHep-1 human cancer cells after 48 h as investigated by quantification of the cellular ATP levels. The concentrations tested were 179 μ M (compound **3**), 179 μ M (compound **4**), 177 μ M (compound **5**), 176 μ M (compound **6**), 179 μ M (compound **7**) and 167 μ M (cisplatin). The control received complete cell culture medium. DMSO was equal to 0.1% by volume. The reported results represent the mean \pm standard deviation from triplicate tests. Student *t*-test was used in data analysis where results were considered as statistically significant when *p* value was smaller than 0.05 if compared with untreated control and indicated with an asterisk (*). The figure shows a representative experiment taken from three independent experiments giving similar results.

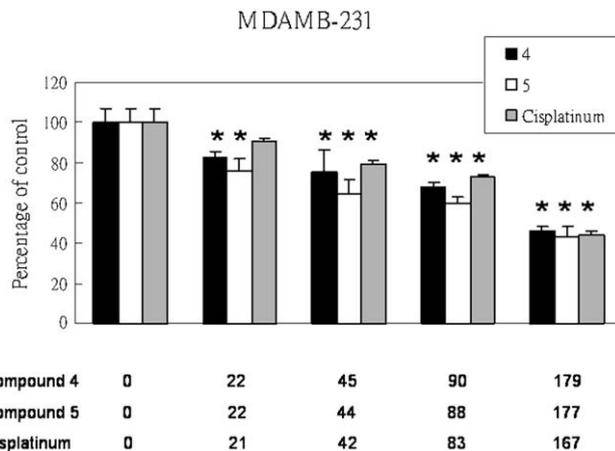

Fig. 3. Dose response inhibitory activity of α -phthalimide ketones on MDAMB-231 human breast cancer cells after 48 h as investigated by quantification of the cellular ATP levels. Concentrations of the compounds are expressed as μ M. The results represent the mean \pm standard deviation from triplicate tests. Student *t*-test was used in data analysis where results were considered as statistically significant when *p* value was smaller than 0.05 if compared with untreated control and indicated with an asterisk (*). The figure shows a representative experiment taken from three independent experiments giving similar results.

investigation revealed a significant decrease in biological activity when the “X” residue changed from a methylene (CH₂) to –CH(CH₃)– group (compound **7**).

4. Conclusion

In conclusion, we have here described the simple preparation of a group of α -phthalimide ketones which showed significant growth inhibitory effect towards MDAMB-231 breast carcinoma and SKHep-1 hepatoma human cancer cell lines tested. Two of these compounds (compounds **4** and **5**) showed biological activities comparable with that exhibited by cisplatin on MDAMB-231 breast cancer cells. The relative cytotoxic activity against SKHep-1 hepatoma cells is concluded as cisplatin > compound **1** > compound **5** > compound **4**. Further experimental work is

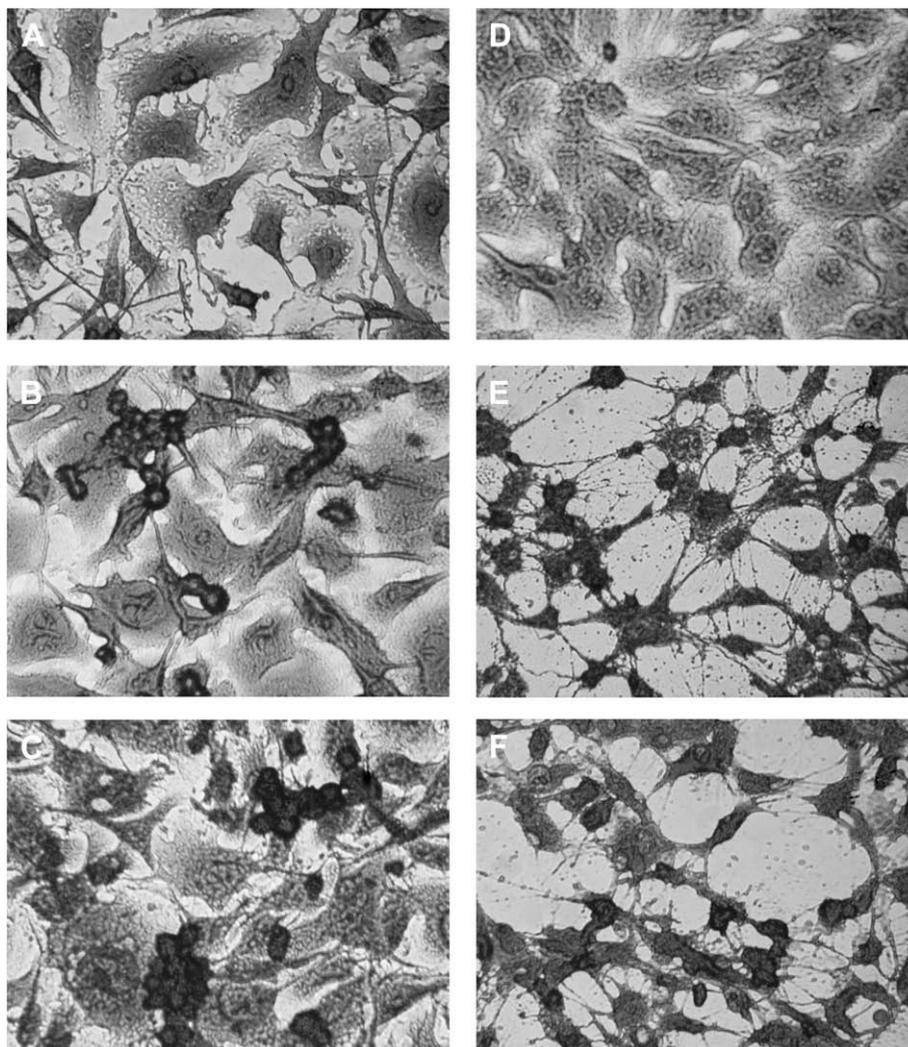

Fig. 5. Morphological investigation of the effect of α -phthalimide ketones on MDAMB-231 breast cancer cells (A–C) and SKHep-1 hepatoma cells (D–F). Cells in A and D were incubated with 0.1% of DMSO. Cells in B and E were treated with compound **4** (179 μ M) while cells in C and F were treated with compound **5** (177 μ M) and Sulforhodamine B stained. Details are reported in Section 5.

on-going to test their anti-tumour activity on athymic nude mice xenograft model systems.

5. Experimental protocols

5.1. Preparation of phthalimide ketones [10–12]

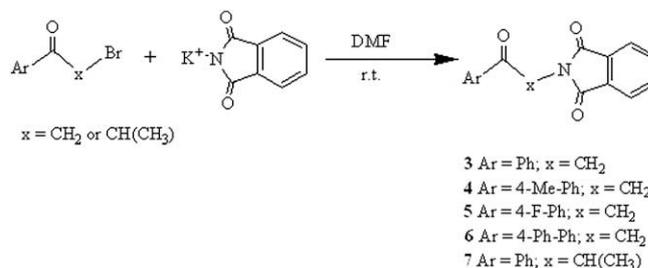

All reactions were monitored by thin layer chromatography (TLC) on Merck aluminum-coated plates of silica gel 60 F 254 and visualized under ultra-violet light (254 nm). NMR spectra were recorded on a Varian Oxford AS 500 MHz Fourier transform spectrometer using CDCl_3 as solvent. As internal reference for ^1H NMR and ^{13}C NMR spectra, residual protic solvents in CDCl_3 (δ_{H} 7.26 ppm, s; δ_{C} 77.7 ppm, t) was used; a positive value of the chemical shift denotes a resonance downfield from TMS. Coupling constants were recorded in hertz (Hz). Multiplicities were recorded as the following abbreviations: s, singlet; bs, broad singlet; d, doublet; t, triplet; q, quartet; m, multiplet. Melting points were determined using a BUCHI Melting Point B-545 machine in capillaries sealed under atmosphere and the data were uncorrected. Mass analyses were performed utilizing a Micromass Q-Tof-2 spectrometer.

In a dried flask, a solution of α -bromoketone (6 mmol) in DMF (10 mL) was added with potassium phthalimide (6 mmol) in one

portion with stirring (Scheme 1). The reaction was run at room temperature and monitored by TLC. After the reaction was complete, the reaction mixture was poured into water (100 mL). The desired products were collected by filtration and recrystallized in ethanol to give the pure products.

5.1.1. 2-Phthalimide-1-phenylethanone **3**

Prepared according to the general procedure described above from 2-bromoacetophenone (6 mmol, 2.0 g) and potassium phthalimide (6 mmol, 1.11 g) and isolated as a white solid, ^1H NMR

Scheme 1. Condensation of α -bromoketone with potassium phthalimide.

(500 MHz, CDCl₃): δ 5.13 (s, 2H), 7.51 (t, 2H, J = 8.0 Hz), 7.63 (t, 1H, J = 7.5 Hz), 7.73–7.75 (m, 2H), 7.88–7.90 (m, 2H), 8.00 (d, 2H, J = 7.5 Hz); ¹³C NMR (125 MHz, CDCl₃): δ 44.85, 124.20, 128.79, 129.55, 132.87, 134.59, 134.70, 134.79, 135.04, 168.55, 191.62; HRMS (ESI): Calcd. for C₁₆H₁₁NO₃Na [M + Na]⁺, 288.0637; found 288.0641; Melting Point = 168–169 °C; Yield = 68% (4.1 mmol., 1.1 g).

5.1.2. 2-Phthalimide-1-p-tolyethanone 4

Prepared according to the general procedure described above from 2-bromo-4'-methylacetophenone (6 mmol, 1.28 g) and potassium phthalimide (6 mmol, 1.11 g) and isolated as a white solid, ¹H NMR (500 MHz, CDCl₃): δ 2.44 (s, 3H), 5.11 (s, 2H), 7.31 (d, 2H, J = 8.5 Hz), 7.74–7.76 (m, 2H), 7.89–7.92 (m, 4H); ¹³C NMR (125 MHz, CDCl₃): δ 22.48, 44.79, 124.22, 128.93, 130.25, 132.64, 132.96, 134.78, 145.71, 168.64, 191.20; HRMS (ESI): Calcd. for C₁₇H₁₃NO₃Na [M + Na]⁺, 302.0793; found 302.0779; Melting Point = 177–177.5 °C; Yield = 66% (4.0 mmol., 1.1 g).

5.1.3. 2-Phthalimide-1-(4-fluoro-phenyl)ethanone 5

Prepared according to the general procedure described above from 2-bromo-4'-fluoroacetophenone (6 mmol, 1.30 g) and potassium phthalimide (6 mmol, 1.11 g) and isolated as a white solid, ¹H NMR (500 MHz, CDCl₃): δ 5.09 (s, 2H), 7.15–7.19 (m, 2H), 7.73–7.75 (m, 2H), 7.87–7.88 (m, 2H), 8.01–8.04 (m, 2H); ¹³C NMR (125 MHz, CDCl₃): δ 44.67, 116.69, 116.87, 124.20, 131.50, 132.79, 134.83, 165.84, 167.88, 168.48, 190.14; HRMS (ESI): Calcd. for C₁₆H₁₀NO₃FNa [M + Na]⁺, 306.0542; found 306.0540; Melting Point = 158–158.9 °C; Yield = 45% (2.7 mmol., 0.77 g).

5.1.4. 2-Phthalimide-1-biphenyl-4-yl-ethanone 6

Prepared according to the general procedure described above from 2-bromo-4'-phenylacetophenone (6 mmol, 1.65 g) and potassium phthalimide (6 mmol, 1.11 g) and isolated as a white solid, ¹H NMR (500 MHz, CDCl₃): δ 5.17 (s, 2H), 7.43–7.44 (m, 1H), 7.49–7.51 (m, 2H), 7.64–7.66 (m, 2H), 7.74–7.78 (m, 4H), 7.91–7.93 (m, 2H), 8.08–8.10 (m, 2H); ¹³C NMR (125 MHz, CDCl₃): δ 44.90, 124.25, 127.99, 128.19, 129.14, 129.42, 129.70, 132.95, 133.78, 134.81, 140.30, 147.40, 168.60, 191.24; HRMS (ESI): Calcd. for C₂₂H₁₅NO₃Na [M + Na]⁺, 364.0950; found 364.0964; Melting Point = 198–199 °C; Yield = 73% (4.4 mmol., 1.5 g).

5.1.5. 2-Phthalimide-1-phenylpropanone 7

Prepared according to the general procedure described above from 2-bromopropiophenone (6 mmol, 896 μ l) and potassium phthalimide (6 mmol, 1.11 g) and isolated as a white solid, ¹H NMR (500 MHz, CDCl₃): δ 1.73 (d, 3H, J = 7.5 Hz), 5.66 (q, 1H, J = 7.0 Hz), 7.39 (t, 2H, J = 7.5 Hz), 7.48 (t, 1H, J = 7.5 Hz), 7.68–7.71 (m, 2H), 7.79–7.83 (m, 4H); ¹³C NMR (125 MHz, CDCl₃): δ 15.59, 51.62, 124.18, 128.70, 129.38, 132.47, 133.71, 134.84, 135.94, 168.13, 196.79; HRMS (ESI): Calcd. for C₁₇H₁₃NO₃Na [M + Na]⁺, 302.0793; found 302.0801; Melting Point = 85.7–86.4 °C; Yield = 65% (3.9 mmol, 1.1 g).

5.2. Cell lines and cell culture

Human breast cancer MDAMB-231 and hepatoma SKHep-1 cell lines were used for preliminary anti-cancer screening of these compounds. Both cancer cell lines were routinely maintained in RPMI cell culture medium supplemented with 5% heat inactivated fetal bovine serum and penicillin/streptomycin antibiotics (complete cell culture medium). The cells were incubated in a humidified cell culture incubator at 37 °C with 5% CO₂.

5.3. Antiproliferative assay of α -phthalimide ketones

Cancer cells were removed from 75 cm³ sterile cell culture flasks with 1 fold trypsin and neutralized with fetal bovine serum. After

washing with phosphate buffered saline and centrifugation, cancer cells were re-suspended in complete cell culture medium at a concentration of approximately 1 \times 10⁵/mL and counted manually using a haematocytometer under an inverted microscope. Cancer cells seeded in the 96 wells microtitre plates for 24 h were prepared for the α -phthalimide ketones screening. The α -phthalimide ketones were dissolved in molecular biology grade dimethylsulfoxide (DMSO). Cisplatin was used as the positive reference and added at a starting concentration of 167 μ M. Compounds were added at a starting concentration of 176 μ M–179 μ M and followed by a serial of two-fold dilutions and incubated for a further 48 h. The effective concentration of DMSO in each case was approximately 0.1% by volume. Untreated control received either total complete cell culture medium or 0.1% DMSO. Afterwards, the evaluation of possible antiproliferative potential of our synthesized compounds was evaluated by the One Step ATP lite assay cell proliferation kit purchased from PerkinElmer (Netherlands). The one step ATP lite assay is a homogeneous experiment of determining the number of viable cells in culture based on quantitation of the ATP present, which is an indicator of metabolically active cells. The homogeneous assay procedure involves adding the single reagent directly to cells cultured in serum-supplemented medium. This results in cell lysis and generation of a luminescent signal proportional to the amount of ATP present. The amount of ATP is directly proportional to the number of cells present in culture.

5.4. Morphological investigation of cancer cells

MDAMB-231 and SKHep-1 human carcinoma cells were seeded at a concentration of 1 \times 10⁵/mL. After 24 h, α -phthalimide ketones were added (compound **4** at 179 μ M and compound **5** at 177 μ M) and incubated for 48 h. Cells were then fixed with trichloroacetic acids, washed and Sulforhodamine B stained. Any morphological changes were compared with the vehicle control under the inverted microscope.

Acknowledgments

We acknowledge a donation fund from Mr. KC Lo to Dr. JCO Tang for the establishment of Lo Ka Chung Centre for Natural Anti-cancer Drug Development (Laboratory B), the matching fund provided by the Hong Kong Polytechnic University (BB65) and a Niche area grant offered by the Hong Kong Polytechnic University to Dr. KH Lam and Dr. JCO Tang (BB8T).
