S Supporting Information

ABSTRACT: An efficient, concise, and transition metal-free synthesis of functionalized sulfonylated five-membered heterocyclic compounds via an S_NAr reaction has been developed. Using commercially available sodium sulfinates as sulfonylation reagents, various five-membered heterocyclic sulfones were obtained in good yields.

■ INTRODUCTION

The heterocyclic sulfone moiety has been proven to be a useful building block in medicinal chemistry. It exists widely in medicinally active compounds, such as antagonists,^{1–4} enzyme inhibitors,^{5–9} and antimicrobial agents.^{10–12} In addition to their medicinal importance, heterocyclic sulfones are useful intermediates in organic synthesis. For example, heterocyclic sulfones serve as substrates in the Julia olefination to construct double bonds^{13–15} (Figure 1).

Several approaches for preparation of aryl sulfones have been reported. Traditional methods to prepare aryl sulfones include the oxidation of sulfides^{16,17} and the sulfonylation of arenes in the presence of strong acids.^{18,19} These traditional methods have been replaced by more efficient routes through Pd or Cu catalyzed cross-coupling reaction between sulfinate salts and aryl halides, aryl boronic acids, or special arenes.^{20–32} Despite significant advances in metal-catalyzed C–S bond formation methods, only a few five-membered heteroaryl sulfones were successfully prepared through cross-coupling reactions because five-membered heteroaryl halides are notoriously poor coupling partners.³³ Furthermore, the sulfonylation of heterocycles containing multiple heteroatoms remains a challenge. Recently, metal-free protocols have attracted considerable attention. Efficient methods for the synthesis of pyridyl, phenyl, and vinyl sulfones have also been developed^{34–38} (Figure 2). Herein, we describe a practical synthesis of five-membered heterocyclic sulfones via the nucleophilic substitution of halogenated or nitrated five-membered heterocycles with sulfinate salts under metal-free conditions.

■ RESULTS AND DISCUSSION

Compared to pyridine and benzene, five-membered heterocycles show intrinsically low reactivity toward nucleophilic reagents because of their π -excessive character. Accordingly, suitably located electron-withdrawing groups are necessary to activate these substrates. Furthermore, the substitution proceeds in general more readily at the α -position than at the β -position to the heteroatom.³⁹ In view of these rules, the coupling of 2-acetyl-5-bromothiophene with sodium *p*-toluenesulfonate was chosen as a model reaction for

optimization studies. After stirring at 110 °C for 10 h under air atmosphere, no product was found in 1,4-dioxane, water, or toluene (Table 1, entries 1–3). In fact, the solubility of the substrate is the cause of ineffectiveness of these three solvents. Only trace amount of product was found in DMA (entry 4), and this transformation was still sluggish even after 0.3 equiv of Bu₄NBr was added (entry 5). It should be mentioned that the sulfonylation of pyridyl halides under the same condition proceeded smoothly,³⁴ which suggest that five-membered heteroaromatic halides are poor coupling partners. Fortunately, using DMSO as solvent, we obtained the product in 60% yield (entry 6). The addition of Bu₄NBr was not helpful for this reaction (entry 7). When the dosage of **2a** increased to 3 equiv, the reaction afforded product in 72% yield (entry 8). Further increasing **2a** to 5 equiv, we isolated the product in 93% yield (entry 9). Prolonging the reaction time to 20 h resulted in a slightly increased yield (entry 10 vs entry 9). Reducing the reaction time or lowering the reaction temperature resulted in an obviously decreased yield (entry 11 or 12 vs entry 8).

With the optimized reaction condition in hand, we next explored the scope of the reaction between various sulfinate salts and heterocyclic halides. Aryl sulfinates and alkyl sulfinates afforded sulfones in excellent yields (Table 2, entries 1–7). It seemed that the reactivity was influenced by the nucleophilic ability of sulfinates. Sulfinates with electron-donating group on the benzene ring performed better than those with electron-withdrawing group (entries 1–3 vs entry 4). Interestingly, chlorothiophene provided the product with the same high yield as corresponding bromothiophene (entry 1 and entry 7). It should be noted that chlorothiophenes often give notably lower yields than bromothiophenes in a transition metal-catalyzed system. Subsequently, we applied this method to a range of five-membered heterocycles. This reaction has good compatibility with various functional groups. Acetyl, ester, and even aldehyde survived in this reaction (entries 1, 8, 9). When 2-bromothiophene **1e** was subjected to this reaction, only trace of product was observed, which may be ascribed to its lower

Figure 1. Examples of important five-membered heteroaryl sulfones.

Figure 2. Recent works for the synthesis of sulfones in metal-free protocol.

reactivity toward nucleophilic reagents (entry 10). Even 3-bromothiophene **1f** did not undergo this transformation, which may be due to the lower stability of its σ -adduct intermediate (entry 11). These experimental results are consistent with the $S_N\text{Ar}$ mechanism of five-membered heteroaromatic substrates. Furyl halides, for example, **1g**, also underwent such transformation, and afforded the product in moderate yield (entry 12). Interestingly, brominated indoles were good substrates for this reaction, which provides a convenient synthetic method for important indole derivatives (entries 13 and 14). Compound **3n** is an analogue of compound **A**, which was found to be a novel potent and highly selective HIV-1 nonnucleoside reverse transcriptase inhibitor.⁵ **1h** has no electron-withdrawing group, but it performed efficiently; it may ascribe to the formation of a stable benzyl anion intermediate. We further found that an NO_2 group could serve as the leaving group. 5-Nitrothiophene-2-carboxaldehyde **1j** gave sulfone **3i** in moderate yield (entry 15).

When 2-bromo-5-nitrothiophene was subjected to this reaction, disulfone **3o** and **3p** were isolated in good yield (entries 16, 17). 2-Nitrothiophene, like 2-bromothiophene, still remains problematic (entry 18).

Then, we put our focus on the transformation of heterocyclic halides containing multiple heteroatoms.⁴⁰ The reaction of 2-bromothiazole **4a** with different sulfonates performed smoothly (Table 3, entries 1–6). Other heterocycles with multiple heteroatoms were further tested. 2-Bromobenzothiazole and 2-chlorobenzothiazole were efficiently transformed into sulfones in the presence of sulfonate salts (entries 7 and 8). When methyl sulfonate was used as the nucleophile, a mixture of **5i** and 2(3*H*)-benzothiazolone was obtained (entry 9). 2-Bromo-*N*-methylimidazole **4d** and 8-bromocaffeine **4f** were also good substrates for this reaction (entries 10, 12, and 13). However, 5-chloro-*N*-methylimidazole **4e** kept no change (entry 11). Only trace amount of product was isolated for oxazole **4g** (entry 14). It was transformed into 2(3*H*)-benzoxazolone.

In support of the application of this method, we conducted the reaction on a gram scale, and it also showed good performance (Table 3, entry 5). The structure of **5e** was characterized by X-ray diffraction (Figure 3), which confirms that the coupling occurs via C–S bond formation. To our knowledge, synthesis of five-membered heterocyclic sulfones containing multiple heteroatoms has hardly been studied, and several products are reported for the first time; they may be effective skeletons in medicines or organic synthesis.

Although the above experimental results are in accordance with a metal-free $S_N\text{Ar}$ mechanism, the effect of trace of metal impurities and a radical mechanism should still be considered. To study whether a metal or a radical intermediate is involved in this reaction, several control experiments were carried out. First, the reaction substrates were analyzed using inductively

coupled plasma atomic emission spectroscopy (ICP-AES), 0.1 ppm of Pd, Cu, Fe, and other metal species were detected in sulfinate (Table S1). Then, the reaction was carried out in the presence of 200 ppm of Cu(OAc)₂ or Pd(OAc)₂. As shown in Scheme 1, none of them promoted the reaction rate. We further found that the yield had no change in Ar atmosphere, and the addition of 0.5 equiv of TEMPO showed no inhibition (Scheme 2). Based on these results, the effect of metal impurities and a radical mechanism should be excluded.

With the above results and proof in the literature,³⁹ an addition–elimination mechanism is proposed as shown in Scheme 3. First, the addition of nucleophile 2a to the heteroaromatic electrophile 1d generates σ -adduct intermediate D. The intermediate is stabilized by an electron-withdrawing group. Then, elimination of bromide gives the product 3i. The formation of σ -adduct intermediate E, resulting from the addition of 2a to 3-bromothiophene 1f, is difficult, so it hardly

undergoes such a transformation. However, if the intermediate forms, it could afford the sulfonylation product.

CONCLUSIONS

In conclusion, we have developed an efficient approach for the synthesis of five-membered heterocyclic sulfones, which have been proven to be important in series of medicinally active compounds. The reaction proceeds under mild conditions and avoids the use of metal catalysts and other additives, which make it significantly greener than current alternatives. Meanwhile, we have conducted several experiments to identify a transition metal-free S_NAr mechanism.

EXPERIMENTAL SECTION

General Description. ¹H NMR and ¹³C NMR spectra were measured on a 400 MHz spectrometer (¹H 400 MHz, ¹³C 100 MHz), using CDCl₃ as the solvent with tetramethylsilane (TMS) as the internal standard. Chemical shifts (δ) are reported in ppm, and

coupling constants (J) are in Hertz (Hz). s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet. Mass spectra were recorded with ESI mode. HRMS analysis was recorded on a Q-TOF mass spectrometer with ESI mode. Chemicals were purchased or prepared by literature.^{41,42} Anhydrous DMSO was used for reaction.

General Procedure (3a for Example). To a 10 mL flask was added 2-acetyl-5-bromothiophene (0.3 mmol), sodium *p*-toluenesulfonate (1.5 mmol), and 2 mL anhydrous DMSO, and the reaction mixture was stirred at 110 °C for 10 h. After cooling down to room temperature, the reaction mixture was mixed with ethyl acetate (15 mL), then washed by brine (4 × 15 mL) to get rid of DMSO and excess sodium sulfonates. After drying with Na₂SO₄, the ethyl acetate extracts were concentrated in vacuum, and the residue was purified by flash column chromatography on silica gel to give the product.

3a.³¹ White solid (78.0 mg, 93%). mp = 162.0–163.7 °C. Isolated by flash column chromatography (ethyl acetate/petroleum ether = 1:4). ¹H NMR (CDCl₃, 400 MHz): δ 7.87 (d, J = 7.6 Hz, 2 H), 7.63 (d, J = 4.0 Hz, 1 H), 7.55 (d, J = 4.0 Hz, 1 H), 7.33 (d, J = 7.6 Hz, 2 H), 2.54 (s, 3 H), 2.41 (s, 3 H) ppm. ¹³C NMR (CDCl₃, 100 MHz): δ 190.4, 150.2, 150.1, 145.2, 138.0, 132.6, 131.3, 130.2, 127.7, 26.9, 21.6 ppm. MS (ESI): *m/z* calcd. [M+1]⁺ = 281.4; Found 281.3.

3b.³¹ Light yellow solid (66.2 mg, 83%). mp = 131.6–131.9 °C. Isolated by flash column chromatography (ethyl acetate/petroleum ether = 1:4). ¹H NMR (CDCl₃, 400 MHz): δ 7.99 (d, J = 8.0 Hz, 2 H), 7.66–7.52 (m, 5 H), 2.54 (s, 3 H) ppm. ¹³C NMR (CDCl₃, 100 MHz): δ 190.3, 150.4, 149.7, 140.9, 133.9, 132.9, 131.3, 129.5, 127.6, 26.9 ppm. HRMS (ESI-TOF) m/z : [M - H]⁻ Calcd for C₆H₇O₄S₃ 238.9506; Found 238.9510.

5a.⁴³ White solid (60.2 mg, 84%). mp = 129.3–129.8 °C. Isolated by flash column chromatography (ethyl acetate/petroleum ether = 1:2). ¹H NMR (CDCl₃, 400 MHz): δ 7.98 (d, J = 8.4 Hz, 2 H), 7.94 (d, J = 2.8 Hz, 1 H), 7.64 (d, J = 2.8 Hz, 1 H), 7.36 (d, J = 7.6 Hz, 2 H), 2.43 (s, 3 H) ppm. ¹³C NMR (CDCl₃, 100 MHz): δ 167.6, 145.6, 145.2, 135.8, 130.1, 128.7, 125.6, 21.7 ppm. HRMS (ESI-TOF) m/z : [M + H]⁺ Calcd for C₁₀H₁₀NO₂S₂ 240.0153; Found 240.0142.

5b.⁴³ White solid (60.2 mg, 73%). mp = 129.4–130.2 °C. Isolated by flash column chromatography (ethyl acetate/petroleum ether = 1:2). ¹H NMR (CDCl₃, 400 MHz): δ 8.72 (s, 1 H), 8.06–7.90 (m, 5 H), 7.68–7.63 (m, 3 H) ppm. ¹³C NMR (CDCl₃, 100 MHz): δ 145.3, 135.7, 135.6, 132.2, 130.7, 129.8, 129.7, 129.7, 128.0, 127.8, 125.8, 123.0 ppm. HRMS (ESI-TOF) *m/z*: [M + H]⁺ Calcd for C₁₃H₁₀NO₂S₂ 276.0153; Found 276.0138.

5c.⁴⁶ Colorless oil (33.7 mg, 69%). Isolated by flash column chromatography (ethyl acetate/petroleum ether = 1:2). ¹H NMR (CDCl₃, 400 MHz): δ 8.04 (d, J = 3.2 Hz, 1 H), 7.74 (d, J = 3.2 Hz, 1 H), 3.33 (s, 3 H) ppm. ¹³C NMR (CDCl₃, 100 MHz): δ 166.2, 144.9, 125.8, 42.7 ppm. MS (ESI): *m/z* Calcd. [M+1]⁺ = 164.2; Found 164.2.

5d.⁴³ White solid (50.5 mg, 89%). mp = 70.8–72.5 °C. Isolated by flash column chromatography (ethyl acetate/petroleum ether = 1:2). ¹H NMR (CDCl₃, 400 MHz): δ 8.06 (d, J = 3.2 Hz, 1 H), 7.72 (d, J = 3.2 Hz, 1 H), 2.82–2.75 (m, 1 H), 1.51–1.49 (m, 2 H), 1.18–1.16 (m, 2 H) ppm. ¹³C NMR (CDCl₃, 100 MHz): δ 166.1, 145.1, 125.6, 31.8, 6.5 ppm. HRMS (ESI-TOF) *m/z*: [M + H]⁺ Calcd for C₆H₈NO₂S₂ 189.9996; Found 190.0006.

5e.⁴⁷ White solid (1.1 g, 82%). mp = 122.5–124.3 °C. Isolated by flash column chromatography (ethyl acetate/petroleum ether = 1:2). ¹H NMR (CDCl₃, 400 MHz): δ 8.12–8.10 (m, 2 H), 7.96 (d, J = 3.2 Hz, 1 H), 7.67–7.55 (m, 4 H) ppm. ¹³C NMR (CDCl₃, 100 MHz): δ 167.1, 145.3, 138.9, 134.3, 129.5, 128.7, 125.9 ppm. MS (ESI): *m/z* Calcd. [M+1]⁺ = 226.3; Found 226.1.

5f.⁴⁸ White solid (31.1 mg, 40%). mp = 136.6–138.1 °C. Isolated by flash column chromatography (ethyl acetate/petroleum ether = 1:2). ¹H NMR (CDCl₃, 400 MHz): δ 8.04 (d, J = 8.8 Hz, 2 H), 7.97 (d, J = 3.2 Hz, 1 H), 7.69 (d, J = 2.8 Hz, 1 H), 7.54 (d, J = 8.8 Hz, 2 H) ppm. ¹³C NMR (CDCl₃, 100 MHz): δ 166.7, 145.4, 141.3, 137.3, 130.1, 129.8, 126.0 ppm. MS (ESI): *m/z* Calcd. [M+1]⁺ = 260.7; Found 260.7.

5g.⁴⁹ White solid (60.6 mg, 70%). mp = 129.9–131.8 °C. Isolated by flash column chromatography (ethyl acetate/petroleum ether = 1:2). ¹H NMR (CDCl₃, 400 MHz): δ 8.15 (d, J = 7.6 Hz, 1 H), 8.04 (d, J = 7.6 Hz, 2 H), 7.95 (d, J = 8.0 Hz, 1 H), 7.54 (m, 2 H), 7.37 (d, J = 7.2 Hz, 2 H), 2.43 (s, 3H) ppm. ¹³C NMR (CDCl₃, 100 MHz): δ 167.7, 152.9, 145.9, 137.0, 135.5, 130.2, 129.0, 127.7, 127.4, 125.5, 122.2, 21.7 ppm. MS (ESI): *m/z* Calcd. [M+1]⁺ = 290.4; Found 290.3.

5h.⁵⁰ Light yellow solid (76.0 mg, 78%). mp = 154.3–156.0 °C. Isolated by flash column chromatography (ethyl acetate/petroleum ether = 1:2). ¹H NMR (CDCl₃, 400 MHz): δ 8.77 (s, 1 H), 8.15–7.89 (m, 6 H), 7.67–7.51 (m, 4H) ppm. ¹³C NMR (CDCl₃, 100 MHz): δ 167.4, 152.9, 137.0, 135.7, 135.3, 132.2, 131.1, 129.9, 129.8, 129.7, 128.0, 127.8, 127.5, 125.5, 123.1, 122.2 ppm. MS (ESI): *m/z* Calcd. [M+1]⁺ = 326.4; Found 326.3.

5i.⁵¹ White solid (it is an inseparable mixture containing **5i** and **2(3H)**-benzothiazolone, identified by GC-MS, and a ratio of 2:1 via ¹H NMR. Totally 47.5 mg, the yield for only **5i** after calculation: 55%). Isolated by flash column chromatography (ethyl acetate/petroleum ether = 1:4). For only **5i**: ¹H NMR (CDCl₃, 400 MHz): δ 8.21 (d, J = 7.6 Hz, 1 H), 8.01 (d, J = 8.0 Hz, 1 H), 7.62 (m, 2 H), 3.41 (s, 3 H) ppm. HRMS (ESI-TOF) *m/z*: [M + H]⁺ Calcd for C₈H₈NO₂S₂ 213.9996; Found 213.9991.

5j.⁴³ White solid (48.1 mg, 68%). mp = 155.6–156.5 °C. Isolated by flash column chromatography (ethyl acetate/petroleum ether = 1:1). ¹H NMR (CDCl₃, 400 MHz): δ 7.92 (d, J = 8.4 Hz, 2 H), 7.35 (d, J = 8.0 Hz, 2 H), 7.09 (d, J = 1.2 Hz, 1 H), 6.94 (d, J = 1.2 Hz, 1 H), 3.97 (s, 3 H), 2.43 (s, 3 H) ppm. ¹³C NMR (CDCl₃, 100 MHz): δ 145.2, 143.4, 136.7, 129.9, 129.4, 128.2, 125.5, 35.2, 21.7 ppm. HRMS (ESI-TOF) *m/z*: [M + H]⁺ Calcd for C₁₁H₁₃N₂O₂S 237.0698; Found 237.0680.

5l.⁴³ White solid (75.1 mg, 72%). mp = 208.9–209.7 °C. Isolated by flash column chromatography (ethyl acetate/petroleum ether = 1:1). ¹H NMR (CDCl₃, 400 MHz): δ 7.93 (d, J = 8.4 Hz, 2 H), 7.39 (d, J = 8.4 Hz, 2 H), 4.30 (s, 3 H), 3.52 (s, 3 H), 3.37 (s, 3 H), 2.46 (s, 3 H) ppm. ¹³C NMR (CDCl₃, 100 MHz): δ 155.5, 151.2, 146.7, 146.5, 146.3, 135.6, 130.2, 128.6, 109.8, 34.2, 30.0, 28.2, 21.8 ppm. HRMS (ESI-TOF) *m/z*: [M + H]⁺ Calcd for C₁₅H₁₇N₄O₄S 349.0971; Found 349.0961.

5m.⁴³ White solid (77.1 mg, 67%). mp = 221.0–223.3 °C. Isolated by flash column chromatography (ethyl acetate/petroleum ether = 1:1). ¹H NMR (CDCl₃, 400 MHz): δ 8.66 (s, 1 H), 8.05–7.93 (m, 4 H), 7.74–7.65 (m, 2 H), 4.36 (s, 3 H), 3.51 (s, 3 H), 3.37 (s, 3 H) ppm. ¹³C NMR (CDCl₃, 100 MHz): δ 155.4, 151.2, 146.6, 146.4, 135.7, 135.4, 132.0, 130.6, 130.1, 129.9, 129.7, 128.1, 122.7, 39.3, 30.0, 28.2 ppm. HRMS (ESI-TOF) *m/z*: [M + H]⁺ Calcd for C₁₈H₁₇N₄O₄S 385.0971; Found 385.0962.
