Novel 2-(Hydroxyalkyl)pyridines Derived from the Chiral Pool

Hans Adolfsson, Kerstin Nordström, Kenneth Wärnmark and Christina Moberg*

Department of Chemistry, Organic Chemistry, Royal Institute of Technology, S-100 44 Stockholm, Sweden

Abstract: Two diastereomeric 2-(1-hydroxyalkyl)pyridines were conveniently prepared starting from (-)-menthol. The pyridylalcohols were subsequently allowed to react with phosphorus oxychloride to yield, in one step, C_3 -symmetric tripodal tripyridine ligands. Copyright © 1996 Elsevier Science Ltd

Introduction

Transition metal catalysis is a highly attractive method to obtain chiral enantiopure compounds since the chirality may be transferred from a small amount of a chiral compound to a large amount of product.¹ To achieve this, efficient chiral ligands are required, and extensive current interest is therefore devoted to the preparation of new ligands.²

Chiral pyridine alcohols have proven to be versatile ligands in a variety of catalytic applications, in many cases inducing high stereoselectivity.³ For example, 2-(hydroxyalkyl)pyridines catalyze the enantioselective addition of diethylzinc to aldehydes,⁴ the nickel-catalyzed conjugate additions to enones,⁵ and asymmetric epoxidations.⁶ These compounds also serve as useful starting materials for the preparation of pyridineoxazolinealcohols,⁷ which catalyze other types of processes.⁸

Chiral 2-(1-hydroxyalkyl)pyridine derivatives can be prepared according to at least five different procedures. Asymmetric reduction of 2-ketopyridines has been demonstrated in some cases to afford the desired alcohols in high chemical yields and optical purity. Thus, reduction of 2-acetylpyridine using magnesium perchlorate and (S)-N-benzyl-3-methoxy-4-methyl-1,4-dihydropyridine afforded the alcohol (R)-1 in about 87% ee.⁹ The reduction of 2-(1-oxo-2,2-dimethylpropyl)pyridine using (-)-chloro-diisopinocampheylborane [(-)-Ipc₂BCl] proceeded with approximately the same enantioselectivity, affording the alcohol (R)-2 in 91% ee.¹⁰ The second method employs chromatographic separation of diastereomeric derivatives of a racemic mixture of alcohols. By this manner, the pure enantiomers of 2 were obtained,¹¹ although large quantities were difficult to obtain. Certain derivatives are possible to obtain via enzymatic resolution of a racemate, although this method is not quite general.¹² In this way, enantiopure 2-(1-hydroxyethyl)pyridine 1, in both optical forms, was obtained, whereas only low stereoselectivity was observed upon resolution of the *t*-butyl derivative.^{12a} In the fourth method, the 2-(1-hydroxyalkyl)pyridine derivatives are obtained by cobalt(I) catalyzed cyclotrimerization of acetylenes with optically active nitriles.¹³ Finally, one method employing the chiral pool has also been reported.¹⁰ Menthone, for example, was shown to react

with 2-pyridyllithium to yield an alcohol **3** with high stereoselectivity. This alcohol showed poor performance in catalytic applications, 10,14 however, probably due to the resemblance of the two alkyl substituents.

We have now devised a new method, starting from (-)-menthol 4, which is presented in this paper together with its application to the synthesis of a C_3 -symmetric tripodal ligand.

Results and Discussion

Preparation of chiral enantiopure 2-(1-hydroxyalkyl)pyridines. (1R, 2S, 5R)-(-)-Menthol was transformed into its tosylate 5,¹⁵ which was reacted with sodium cyanide in DMSO to yield nitrile 6 (99%). This nitrile gave ketone 7 upon reaction with 2-pyridyllithium (41%, Scheme 1). Reduction using sodium borohydride afforded a mixture of two diastereomeric alcohols in a ratio of 83:17. The alcohols were easily separated by chromatography to yield pure 8a and 8b (90% total yield).

The coupling constants in the ¹H NMR spectra of compounds **8a** and **8b** indicated that the two compounds assume chair conformations with the hydroxypyridyl substituents in axial position. As a consequence of a stereoelectronic effect present in these types of compounds, it was also assumed that the hydroxymethylpyridine part of the molecule adopts a conformation in which the carbon-oxygen bond is parallel to the pyridine ring, with the heteroatoms *anti* to one another.¹⁶ However, intramolecular hydrogen bonding resulting in a *syn* conformation can not be excluded. In either of these conformations, one of the isopropyl methyl groups in the *R* isomer **8b** is shielded by the pyridine ring, which should result in an upfield shift for that proton, whereas in the epimer **8a**, the methyl groups are not influenced by the pyridine ring

(Figure 1). Therefore, **8b** was thought to be the major isomer. In order to verify this assumption, the Mosher esters of the two alcohols were prepared.¹⁷ According to the generally accepted rule, it was concluded that **8b** was, indeed, the major diastereomer.

Figure 1. Assumed conformations of the pyridylalcohols 8a (minor diastereomer) and 8b (major diastereomer).

Preparation of C3-symmetric phosphorus triesters. With these chiral alcohols in hand, we turned to the synthesis of tripodal pyridine ligands. First, the reactions of racemic alcohols (\pm) -1 and (\pm) -2 with phosphorus oxychloride were studied. From (\pm) -1, the expected statistical 1:3 mixture of homochiral : heterochiral diastereomers 9 was observed by ¹H NMR spectroscopy. In contrast, we were pleased to note that reaction with (\pm) -2 resulted in an apparent 1:1 mixture of diastereomers (10 and stereoisomers), showing that homochiral $(R,R,R)^*$ isomers were preferred over the heterochiral $(R,R,S)^*$ isomers, probably due to the high steric demand of the ligand. The phenomenon of nonstatistical distribution of isomers was further demonstrated employing an 85:15 scalemic mixture of alcohol 2, obtained by asymmetric reduction of 1-(2-pyridyl)-2,2-dimethylpropanone with (-)-Ipc₂BCl, in the reaction. In this case, a 5:1 ratio of homochiral : heterochiral isomers was obtained. This observation implies that care should be taken when analysis of the diastereomeric ratio of phosphoric esters is used for the determination of the eets of scalemic mixtures, even if this topic has been carefully examined in several examples.¹⁸

As expected, the pure R, R, R-isomer 9 was obtained when enantiopure 1 was used in the reaction with phosphorus oxychloride. This was also the case for the tri-ester obtained from enantiopure alcohols 8a and 8b (11a and 11b, respectively).

The practical and simple method for the preparation of the chiral pyridylalcohols **8a** and **8b** is yet another example which demonstrates the utility of the chiral pool. The chiral alcohols obtained proved to be useful in the preparation of a new class of C_3 -symmetric pyridine ligands. In future work, we will focus on the preparation of transition metal complexes of the C_3 -symmetric ligands and to investigate their potential as catalysts in asymmetric synthesis.

Experimental section

General. The synthesis of (R)-1-(2-pyridyl)ethanol 1 was performed using an enzymatic method.^{12a} (R)-1-(2-Pyridyl)-2,2-dimethylpropanol 2 was produced by reduction of the corresponding ketone with (-)-Ipc₂BCl.¹⁹ (1*R*,2*S*,5*R*)-Menthyltosylate 5 was prepared according to a literature procedure from (1*R*,2*S*,5*R*)-(-)-menthol.¹⁵ ¹H NMR and ¹³C NMR spectra were recorded at 400 and 100.6 MHz, respectively, unless otherwise stated.

(15,25,5R)-1-Cyano-2-isopropyl-5-methylcyclohexane 6. (1R,2S,5R)-Menthyltosylate (2.60 g, 8.44 mmol) and sodium cyanide (830 mg, 16.9 mmol) were stirred in DMSO (50 mL) at 90 °C for 5 h. The product was extracted using EtOAc/H₂O, the combined organic phases were dried (MgSO₄) and the solvent evaporated. Kugelruhr distillation afforded the desired nitrile (1.39 g, 99%). ¹H NMR: 0.80-1.04 (2H, m), 0.91 (3H, d, J = 6.5 Hz), 0.95 (6H, d, J = 6.5 Hz), 1.14 (1H, ddd, J = 13, 12 and 4 Hz), 1.21-1.34 (1H, m), 1.52-1.64 (1H, m), 1.66-1.84 (2H, m), 1.85-1.92 (1H, m), 1.98 (1H, dq, J = 13 and 3 Hz), 3.03-3.08 (1H, m). ¹³C NMR: 20.61, 20. 73, 21.81, 26.97, 28.50, 31.14, 31.27, 34.55, 37.38, 45.65, 121.05.

[(15,25,*F*)-1-(2-Isopropyl-5-methyl)cyclohexyl](2-pyridyl)ketone 7. Nitrile 6 (600 mg, 3.64 mmol) in diethyl ether (4 mL) was added to 2-pyridyllithium, prepared in situ from 2-bromopyridine (380 μL, 4 mmol) and butyllithium (1.6 mL, 2.5 M, 4 mmol) in diethyl ether (16 mL, stirring at -78 °C under N₂ for 30 min). After stirring at -78 °C for 2 h, the reaction mixture was allowed to reach room temperature and then stirred at this temperature for a further 1 h. 1M H₂SO₄ (16 mL) was added and the product extracted with diethyl ether. The combined organic phases were washed with aqueous Na₂CO₃ and dried (MgSO₄). Liquid chromatography (column 2.5 x 15 cm, eluent: 300 mL of hexane:EtOAc 92:8) yielded 363 mg (41%) of 7. R_f 0.6 (hexane:EtOAc 92:8) ¹H NMR: δ 0.78 (6H, d, J = 7 Hz, CH₃), 0.8-2.0 (8H, m), 0.91 (3H, d, J = 7 Hz, CH₃), 1.99 (1H, dq, J = 13 and 4 Hz), 4.56-4.64 (1H, m), 7.43 (1H, ddd, J = 8, 5 and 1 Hz, 5-pyridyl), 7.82 (1H, dt, J = 8 and 1.5 Hz, 4-pyridyl), 8.01 (1H, d, J = 8 Hz, 2-pyridyl), 8.66 (1H, bd, J = 5 Hz, 6-pyridyl). ¹³C NMR: 21.58, 22.30, 26.36, 27.15, 30.09, 35.48, 37.39, 40.54, 45.59, 46.90, 122.07, 126.64, 136.92, 148.78, 153.74, 204.48.

(*S*)-[(1*S*,2*S*,5*R*)-1-(2-Isopropyl-5-methyl)cyclohexyl](2-pyridyl)methanol 8a and (*R*)-[(1*S*,2*S*,5*R*)-1-(2-isopropyl-5-methyl)cyclohexyl](2-pyridyl)methanol 8b. Sodium borohydride (92 mg, 2.4 mmol) was added to 7 (113 mg, 0.46 mmol) in methanol (5 mL). The reaction mixture was stirred for 94 h, quenched with water (5 mL), extracted with CH₂Cl₂ (3 x 15 mL) and dried (MgSO₄). Liquid chromatography (column 2 x 12 cm, eluent: hexane:EtOAc 95:5; 90:10; 80:20; 70:30; 50:50 100 mL of each) gave 18 and 85 mg, respectively, of the two diastereomers (total yield 90%, de 65%). 8a (minor diastereomer): $[\alpha]_{D}^{20}$ +10 (c 0.80, EtOH).¹H NMR: δ 0.66-1.90 (2H, m), 0.69 (3H, d, *J* = 6.5 Hz, CH₃), 1.01 (3H, d, *J* = 5.5 Hz, CH₃), 1.03 (3H, d, *J* = 5.5 Hz, CH₃), 1.10-1.20 (1H, m), 1.20-1.27 (1H, m), 1.69-1.90 (4H, m), 1.90-2.04 (1H, m), 2.18 (1H, app. hept., *J* = 2.5 Hz, 1-neomenthyl), 4.50 (1H, bd, *J* = 4 Hz, CHOH), 5.10 (1H, bs, OH), 7.17-7.21 (1H, m, 5-pyridyl), 7.22 (1H, dd, *J* = 8 and 1 Hz, 3-pyridyl), 7.67 (1H, dt, *J* = 8 and 1.5 Hz, 4-pyridyl), 8.55 (1H, dt, *J* = 5 and 1 Hz, 6-pyridyl). ¹³C NMR: δ 21.67, 21.82, 23.46, 26.36, 28.22, 29.47, 35.87, 36.04, 40.99, 47.92, 72.95, 120.30, 121.81, 136.54, 147.64, 162.73. 8b (major diastereomer): $[\alpha]_{D}^{20}$ +5.3 (c 0.79, EtOH). ¹H NMR: δ 0.67 (3H, d, *J* = 6.5 Hz, CH₃), 0.81-0.97 (2H, m), 0.92 (3H, d, *J* = 6.5 Hz, CH₃), 1.03 (3H, d, *J* = 6.5 Hz, CH₃), 1.08-1.18 (2H, m), 1.43-1.65 (2H, m), 1.76-1.88 (2H, m), 2.08 (1H, dquint, *J* = 10 and 6.5 Hz, CH₃), 1.08-1.18 (2H, m), 1.43-1.65 (2H, m), 1.76-1.88 (2H, m), 2.08 (1H, dquint, *J* = 10 and 6.5 Hz, CH(CH₃)₂), 2.36 (1H, app. dq, J = 8 and 4 Hz, 1-neomenthyl) 3.11 (1H, d, J = 8 Hz, OH), 4.95 (1H, app. t, J = 8 Hz, CHOH), 7.19 (1H, ddd, J = 7.5, 5 and 1 Hz, 5-pyridyl), 7.24-7.25 (1H, m, 4-pyridyl), 7.65 (1H, dt, J = 7.5 and 2 Hz, 3-pyridyl), 8.58 (1H, ddd, J = 5, 1.5 and 1 Hz. 6-pyridyl). ¹³C NMR: δ 22.31, 22.55, 22.78, 25.04, 27.15, 30.08, 36.08, 39.14, 42.39, 49.96, 74.64, 121.77, 122.40, 136.22, 149.05, 163.31. Anal. Calcd. for C₁₆H₂₅NO: C, 77.68; H, 10.19; N, 5.66. Found: C, 77.51; H, 10.02; N, 5.63.

(*R*,*R*,*R*)-Tris[1-(2-pyridyl)ethyl] phosphate 9. POCl₃ (12 µL, 0.13 mmol) was added to 1 (48 mg, 0.39 mmol, 99% ee) and Et₃N (54 µL, 0.39 mmol) in dichloromethane (5 mL) at 0 °C. The mixture was allowed to reach room temperature, stirred for five days and the reaction was quenched by the addition of aqueous NH₄Cl (5 mL). The phases were separated and the organic phase was washed with an additional 5 mL of NH₄Cl and dried (MgSO₄). The solvent was evaporated giving an oil (37 mg, 69%). ¹H NMR (250 MHz, CDCl₃) δ 1.59 (9H, d, J = 6.6 Hz, CH₃), 5.52 (3H, app. quintet, J (C-H) = ³J(P-H) ≈ 7 Hz), 7.12 (3H, ddd, J = 7.5, 5 and 1 Hz, 5-pyridyl), 7.29 (3H, d, J = 7.5 Hz, 3-pyridyl), 7.58 (3H, dt, J = 7.5 and 1.5 Hz, 4-pyridyl), 8.44 (3H, bd, J = 5 Hz, 6-pyridyl).

(*R*,*R*,*R*)-Tris[1-(2-pyridyl)-2,2-dimethylpropyl] phosphate 10. POCl₃ (26 µL, 0.17 mmol) was added to 2 (83 mg, 0.50 mmol, 71% ee) and Et₃N (70 µL, 0.50 mmol) in diethyl ether (10 mL) at 0 °C. The mixture was allowed to reach room temperature overnight and the reaction was then quenched by addition of aqueous NH₄Cl (2 mL). The reaction mixture was extracted with CH₂Cl₂ (3 x 25 mL) and the organic phase was dried (MgSO₄). The solvent was evaporated to give an oil which was purified by liquid chromatography [column: 0.5 x 6 cm, eluent: hexane (5 mL), EtOAc (10 mL), acetone: EtOAc (1:9, 10 mL) and acetone (3 mL)] to give white crystals of 10 [4.2 mg, 4.6%, (*R*,*R*,*R* + *S*,*S*,*S*):(*R*,*R*,*S* + *R*,*S*,*S*) > 95:5]. ¹H NMR (250 MHz, CDCl₃) δ 0.57 (27H, s, C(CH₃)₃), 5.11 (3H, d, ³*J* (P-H) = 3.9 Hz, CH), 7.12-7.20 (3H, m, 5-pyridyl), 7.31 (3H, d, *J* = 8 Hz, 3-pyridyl), 7.67 (3H, bt, *J* = 8 Hz, 4-pyridyl), 8.50-8.54 (3H, m, 6-pyridyl).

(*S*,*S*,*S*)-**Tris-{**[(1*S*,2*S*,*S*,*P*)-1-(2-isopropyl-5-methyl)cyclohexyl](2-pyridyl)methyl} phosphate 11a. POCl₃ (43 μL, 0.46 mmol) was added to **8a** (368 mg, 1.49 mmol) and Et₃N (207 μL, 1.49 mmol) in diethyl ether (5 mL) at 0 °C. The mixture was allowed to reach room temperature and then stirred for 7 days, after which time reaction was quenched by addition of aqueous NH₄Cl (5 mL). The reaction mixture was extracted with CH₂Cl₂ and the organic phase was dried (MgSO₄). The solvent was removed in vacuo and the product was purified by column chromatography to give 212 mg (58 %) of **11a**: $[\alpha]_D^{20}$ -22 (c 0.9, CHCl₃). ¹H NMR: δ 0.43-0.98 (9H, m), 0.58 (9H, d, *J* = 6 Hz, CH₃), 0.85 (9H, d, *J* = 6.5 Hz, CH₃), 0.86 (9H, d, *J* = 6.5 Hz, CH₃), 1.15-1.29 (6H, m), 1.34-1.59 (12H, m), 2.31-2.39 (3H, m), 5.70 (3H, dd, *J* (C-H) = 5 Hz *J* (P-H) = 8.5 Hz), 7.18 (3H, ddd, *J* = 8, 5 and 1 Hz, 5-pyridyl), 7.21 (3H, bd, *J* = 8 Hz, 3-pyridyl), 7.62 (3H, dt, *J* = 8 and 2 Hz, 4-pyridyl), 8.52 (3H, ddd, *J* = 5, 2 and 1 Hz, 6-pyridyl). ¹³C NMR. δ 21.55, 22.11, 23.27, 25.41, 26.82, 28.05, 35.55, 35.78, 39.76, 48.34, 37.53 (*J* = 7.5 Hz), 121.66, 122.13, 135.51, 148.76, 160.88.

(*R*,*R*,*R*)-**Tris**-{[(15,2*S*,5*R*)-1-(2-isopropyl-5-methyl)cyclohexyl](2-pyridyl)methyl} phosphate 11b. Compound 11b was prepared from POCl₃ (86 μ L, 0.92 mmol) and **8b** (720 mg, 2.91 mmol) according to the procedure described for the preparation of 11a. The crude product was purified with column chromatography to give 350 mg (48%) of 11b: $[\alpha]_{p}^{20}$ -45 (c 1.35, CHCl₃). ¹H NMR: δ 0.49 (9H, d, *J* = 6.5 Hz, CH₃), 0.57-0.72 (6H, m), 0.80-0.98 (6H, m), 0.82 (9H, d, *J* = 6.5 Hz, CH₃), 0.96 (9H, d, *J* = 6.5 Hz, CH₃), 1.00-1.13 (3H, m), 1.44-1.58 (9H, m), 1.89-2.02 (3H, m), 2.47-2.53 (3H, m), 5.44 (3H, app. t, *J* (C-H) = ³*J*(P-H) =7.5 Hz), 7.04 (3H, bd, *J* = 8 Hz, 3-pyridyl), 7.07 (3H, ddd, *J* = 8, 5 and 1 Hz, 5-pyridyl), 7.48 (3H, dt, *J* = 8 and 2 Hz, 4-pyridyl), 8.54 (3H, dd, J = 5 and 1 Hz, 6-pyridyl). ¹³C NMR: δ 22.07, 22.51, 22.70, 24.60, 26.68, 29.03, 35.75, 36.55, 40.49, 49.08, 80.58 (J = 5 Hz), 122.50, 122.72, 135.74, 148.49, 160.31.
