The design and synthesis of triple-acting PPAR α , - γ , and - δ agonist 3-(2-ethyl-4-{2-[2-(4-fluorophenyl)-5-methyloxazol-4-yl]ethoxy}phenyl)propanoic acid (**1a**) is described. The compound possesses a potent triple-acting PPAR α , - γ , and - δ agonist profile with an EC₅₀ of 0.029, 0.013, and 0.029 μ M, respectively. The synthetic route, involving the synthesis of oxazole rings as the key step, starts from commercially available 3-oxopentanoic acid methyl ester and 3-hydroxyacetophenone to afford the target compound **1** with an overall yield of 32%.

Insulin resistance is a basic etiological factor for type 2 diabetes and is also linked to a wide spectrum of other pathophysiologic conditions including hypertension, hyperlipidemia, atherosclerosis, and obesity which are collectively called syndrome X or insulin resistance associated disorders (IRAD).¹ Peroxisome proliferator-activated receptors (PPARs), attractive diabetes target proteins, are members of the nuclear hormone receptor superfamily and function as transcription factors in the regulation of genes involved in glucose and lipid fatty acid metabolism and vessel wall function.^{2,3} To date, three distinct PPAR subtypes (PPAR α , PPAR γ , and PPAR δ or PPAR β) have been identified in most mammalian species.⁴

Currently the two drugs rosiglitazone and pioglitazone on the market are potent ligands of PPAR γ and show efficient insulin sensitization in type 2 diabetes patients.⁵ But to effectively target insulin resistance/hyperglycemia and associated conditions including dyslipidemia and hypertension (i.e., the metabolic syndrome), the concept of simultaneously activating PPAR α , - γ , and - δ through a single compound has received considerable attention over the past few years.⁶ A number of PPAR pan agonists have been described in the literature.^{7–13} However, to the best of our knowledge there are no triple-acting PPARs drugs on the market currently. Thus the development of novel and efficacious triple-acting PPAR α , - γ , and - δ agonists has extensively clinical significance. We herein present the design and synthesis of a new class of triple-acting PPAR α , - γ , and - δ agonists below.

Because selective PPAR δ agonist GW501516 has weak potency on PPAR α ,^{14,15} we sought to improve selectivity for PPAR α and subsequently optimize potency and selectivity. The modifications of the GW501516 included the replacement of thiazolyl by oxazolidinyl and the head group by the biaryl unit. Further exploring the effects of modifying the terminal trifluoromethyl substituent by a range of groups showed that substitution in this position was largely well tolerated and the potency correlated well with the lipophilicity of the substituent (Table 1). Thus we have accomplished a new class of triple-acting PPAR α , - γ , and - δ agonists, one of which, **1a**, is currently in clinical trials for the treatment of dyslipidemia (Figure 1).

Table 1. Effects of modifying the terminal trifluoromethyl substituent

Compound	R	EC ₅₀ / μ M ^a		
		PPAR α	PPAR γ	PPAR δ
Rosiglitazone		1a ^b	0.001	5.248
1a	F	0.029	0.013	0.029
1b	CH ₃	1.175	0.004	0.007
1c	NO ₂	2.884	0.025	0.003
1d	<i>t</i> -Bu	5.495	0.089	0.851
1e	CHN ₄	2.630	6.761	6.761

^aEC₅₀ value is the molar concentration of the test compound that causes 50% of the maximal reporter activity. ^b**1a**: inactivated.

Figure 1. A new class of triple-acting PPAR α , - γ , and - δ agonists.

Scheme 1. Reagents and conditions: (a) K₂CO₃, MeCN, reflux, 1 d, 70–90%; (b) NaOH, EtOH, r.t., overnight, 85–95%.

We envisaged the compound **1** to be efficiently formed via intermolecular coupling of the key intermediate **2** and **3** (Scheme 1). The phenol derivative **2** was obtained following the procedures reported by WO054176.¹⁶ For compound **3**, we

Scheme 2. Reagents and conditions: (a) benzoyl chloride, pyridine, CH_2Cl_2 , 1 d, 90%; (b) Br_2 , ether, 5°C , 95%; (c) NaN_3 , H_2O , acetone, r.t., 92%; (d) Pd-C , HCl , H_2O , EtOAc , H_2 , r.t., 12 h, 80–97%; (e) PPh_3 , 1,4-dioxane, 75°C , 3 h, 15–29%; (f) K_2CO_3 , H_2O , EtOAc , 0°C , overnight; (g) POCl_3 , toluene, reflux, 3 h, 32–41% in two steps; (h) NaOH , EtOH , r.t., 2 h, 87–97%; (i) MsCl , Et_3N , CH_2Cl_2 , r.t., 1 h, 92–98%.

tried several synthetic routes. The key step was the formation of oxazole rings as depicted in Schemes 2 and 3. We first attempted to prepare intermediate **8** by reacting azide **7** with triphenylphosphine and acyl chloride.^{17,18} Azide **7** was produced from 5-hydroxy-2-pentanone through protection, bromination, and reaction with NaN_3 .¹⁹ However, the yield of this process was disappointingly low (less than 20%). Efforts to enhance the efficiency of this reaction by varying the solvents were unsuccessful. Next, we tried another route employing the reduction of azide **7** to amide **10** through catalytic hydrogenation over the Pd/C catalyst. Then the reaction of compound **10** with acyl chloride gave intermediate **11**. Subsequent dehydration of compound **11** with POCl_3 , produced intermediate **8** with an overall yield of 32%.¹⁸ However, the above procedures failed to generate large quantity of intermediate **8** and, as a result, they are not applicable to large-scale synthesis. So we turned to the third route which was much simpler, safer, and more efficient.

In this route, as shown in Scheme 3, the commercially available 3-oxopentanoic acid methyl ester (**12**) was brominated to give bromo ketone **13**.¹⁹ Compound **13** was cyclized with acid amides in the absence of solvent under elevated temperatures to yield the oxazole intermediate **14**.^{20,21} Subsequently, the oxazole ester was reduced with NaBH_4 in methanol to provide the oxazole alcohol **9**.²² Then, elaboration of the hydroxy moiety with MsCl under alkaline conditions was adopted to afford the key intermediate **3** with a yield of 56%.²¹ In this approach, the reaction of cyclizing compound **13** with acid amides to prepare

Scheme 3. Reagents and conditions: (a) Br_2 , CH_2Cl_2 , 5°C , overnight, 98%; (b) 90°C , 18 h, 65–75%; (c) NaBH_4 , MeOH , CH_2Cl_2 , 0°C , 80–95%; (d) MsCl , Et_3N , CH_2Cl_2 , 0°C , 1 h, 95–98%.

intermediate **14** as the key step can easily form an oxazole-olefin under low pH conditions. Meanwhile, the HBr produced by cyclization must be timely removed.

The synthesis route for compound **1** is outlined in Scheme 1. The condensation of phenol **2** with intermediate **3** in acetonitrile under alkaline conditions was conducted under reflux for 24 h to generate the ester **15**.²³ Then saponification of ester **15** with 3 M NaOH , as a final step, afforded the target compound **1** with an overall yield of 32%.^{24–29}

In conclusion, compound **1a** was designed and synthesized as a novel triple-acting $\text{PPAR}\alpha$, γ , and δ agonist in high purity and yield. Moreover, the development of these methods to synthesize oxazole rings is a very useful protocol for the preparation of other pharmaceutical drugs including oxazole compounds.

We are grateful for financial support from the National Key Project for Basic Research (No. 2010CB1126102) and the Outstanding Youth Foundation of Heilongjiang Province (No. JC200706).

 - 21 **Methyl 2-[2-(4-fluorophenyl)-5-methyloxazol-4-yl]acetate (14a)**. Crude compound **13** (10 g, 48 mmol) was stirred with 4-fluorobenzamide (10 g, 72 mmol) at 90 °C for 18 h under a vacuum of 400 mbar. After cooling to room temperature, the mixture was treated under argon with 60 mL of toluene and 30 mL of aqueous sodium bicarbonate solution. Then the resulting suspension was stirred in ice-water bath for 1 h and the precipitate benzamide was filtered off with suction. The combined aqueous phases were extracted in a separatory funnel with 150 mL of toluene. Thereafter the combined organic phase was washed with water, dried over anhydrous sodium sulfate, and evaporated to dryness to give crude **14a** following by recrystallization to afford pure product **14a** (8.6 g, 70%) as a white solid. Mp: 97–98 °C; ¹H NMR (CDCl₃, 400 MHz): δ 2.34 (s, 3H, CH₃), 3.56 (s, 2H, CH₂), 3.73 (s, 3H, OCH₃), 7.10 (t, *J* = 8.8 Hz, 2H, ArH), 7.96 (m, 2H, ArH); ¹³C NMR (CDCl₃, 100 MHz): δ 10.2, 31.9, 52.1, 115.6, 115.8, 123.2, 128.7, 129.3, 145.7, 158.7, 162.5, 164.9, 170.7. IR (KBr) $\nu_{\max}$ (cm⁻¹): 2958, 1735, 1602, 1496, 1222, 1199, 1172, 1159. HR-MS *m/z*: calcd for C₁₃H₁₃FNO₃ [M + H]: 250.0874; found: 250.0877.
 - 22 **2-[2-(4-Fluorophenyl)-5-methyloxazol-4-yl]ethanol (9a)**. To a solution of compound **14a** (0.2 g, 0.8 mmol) in 3 mL of methanol and 2 mL of dichloromethane was added NaBH₄ (30.5 mg, 0.8 mmol) three times and the mixture solution was stirred in an ice bath for 1 h. When **14a** was no longer detected by TLC, solvent was removed followed by recrystallization with ethyl acetate to afford pure product **9a** (0.168 g, 94%) as a white solid. Mp: 114–115 °C; ¹H NMR (CDCl₃, 400 MHz): δ 2.32 (s, 3H, CH₃), 2.71 (t, *J* = 5.6 Hz, 2H, CH₂), 3.35 (br, 1H, OH), 3.92 (m, 2H, OCH₂), 7.11 (t, *J* = 8.8 Hz, 2H, ArH), 7.95 (m, 2H, ArH); ¹³C NMR (CDCl₃, 100 MHz): δ 10.1, 28.2, 61.8, 115.7, 115.9, 123.9, 128.0, 133.9, 144.2, 158.7, 162.5, 165.0. IR (KBr) $\nu_{\max}$ (cm⁻¹): 3279, 2928, 1647, 1500. HR-MS *m/z*: calcd for C₁₂H₁₂FNO₂Na [M + Na]: 244.0744; found: 244.0748.
 - 23 **2-[2-(4-Fluorophenyl)-5-methyloxazol-4-yl]ethyl methanesulfonate (3a)**. To a solution of **9a** (2.7 g, 12 mmol) in CH₂Cl₂ (30 mL) was added Et₃N (3.4 mL, 24 mmol) at 0 °C under argon. The mixture was kept at 0 °C for 30 min and then MsCl (1.42 mL, 18 mmol) was added dropwise. After stirring for 1 h at 0 °C and **9a** was no longer detected by TLC, ammonium chloride solution was added. Thereafter, the mixture was washed with water, dried over anhydrous sodium sulfate, and evaporated to dryness to afford product **3a** (3.58 g, 98%) as a white solid. Mp: 90–92 °C; ¹H NMR (CDCl₃, 400 MHz): δ 2.32 (s, 3H, CH₃), 2.95 (m, 5H, CH₂ and SO₂CH₃), 4.51 (t, *J* = 6.4 Hz, 2H, OCH₂), 7.11 (m, 2H, ArH), 7.93 (m, 2H, ArH); ¹³C NMR (CDCl₃, 100 MHz): δ 10.1, 26.2, 37.2, 68.6, 115.8, 116.0, 123.9, 128.0, 131.1, 145.5, 158.9, 162.5, 165.0. IR (KBr) $\nu_{\max}$ (cm⁻¹): 2955, 1635, 1498, 1338. HR-MS *m/z*: calcd for C₁₃H₁₃FNO₄S [M + H]: 300.0661; found: 300.0698.
 - 24 **Methyl 3-(2-ethyl-4-[2-[2-(4-fluorophenyl)-5-methyloxazol-4-yl]ethoxy]phenyl)propanoate (15a)**. To a solution of compound **2** (1.5 g, 4.13 mmol) in 15 mL of acetonitrile was added K₂CO₃ (0.86 g, 6.2 mmol) and compound **3a** (2.3 g, 8.26 mmol). The mixture was heated under reflux for overnight. Then the acetonitrile was evaporated to dryness and the residues were dissolved in water, extracted in a separatory funnel with ethyl acetate, dried over anhydrous sodium sulfate, and evaporated to dryness to give a crude of product **15a** (1.7 g, 85%) as a brown oil. ¹H NMR (CDCl₃, 400 MHz): δ 1.20 (t, *J* = 7.6 Hz, 3H, CH₃), 2.35 (s, 3H, CH₃), 2.56 (m, 4H, 2CH₂), 2.93 (m, 4H, 2CH₂), 3.66 (s, 3H, OCH₃), 4.21 (t, *J* = 6.6 Hz, 2H, OCH₂), 6.73 (m, 2H, ArH), 7.06 (m, 3H, ArH), 7.94 (m, 2H, ArH); ¹³C NMR (CDCl₃, 100 MHz): δ 10.2, 15.2, 25.7, 26.4, 27.0, 35.5, 51.6, 66.6, 111.7, 114.9, 115.7, 115.9, 124.2, 127.9, 129.7, 130.1, 132.8, 143.3, 145.0, 157.5, 158.6, 162.4, 164.9, 173.5; IR (KBr) $\nu_{\max}$ (cm⁻¹): 2964, 1735, 1608, 1498, 1259, 1232, 1195, 1155.
