substituted barbituric acids, using 0.2 molecular quantities of malonyl chloride and of substituted urea. The malonyl chloride was prepared by the directions of Staudinger and Bereza.<sup>5</sup> The yields averaged about 50%. It is not necessary that all of the urea be in solution when the malonyl chloride is added, but all reagents must be anhydrous and the solids finely pulverized, especially in the preparation of the malonyl chloride. The thio-ureas tend to yield tarry products from which it is often impossible to obtain crystals.

TABLE I

Barbituric acid derivative	Formula	M. p., °C.	% Nitrogen Calcd.	% Nitrogen Found
1- <i>p</i> -Tolyl	C <sub>11</sub> H <sub>10</sub> N <sub>2</sub> O <sub>3</sub>	244	12.84	12.87
1,3-Di- <i>p</i> -tolyl	C <sub>18</sub> H <sub>16</sub> N <sub>2</sub> O <sub>3</sub>	213	9.09	9.05
1,3-Di- <i>o</i> -tolyl	C <sub>18</sub> H <sub>16</sub> N <sub>2</sub> O <sub>3</sub>	171	9.09	8.96
1- <i>p</i> -Phenetyl	C <sub>12</sub> H <sub>12</sub> N <sub>2</sub> O <sub>4</sub>	211	11.29	11.23
1,3-Di- <i>p</i> -phenetyl	C <sub>20</sub> H <sub>20</sub> N <sub>2</sub> O <sub>5</sub>	167	7.61	7.50
1,3-Di- <i>o</i> -tolyl-2-thio	C <sub>18</sub> H <sub>16</sub> N <sub>2</sub> O <sub>2</sub> S	217	8.64	8.55

**Aryl Nitrogen Barbituric Acids and *p*-Nitrobenzyl Bromide.**—Lyons and Dox<sup>6</sup> have shown that *p*-nitrobenzyl bromide reacts with the alkyl barbituric acids having replaceable hydrogen and suggest it as a reagent for their identification. The following 5,5-bis-*p*-nitrobenzyl derivatives of the aryl nitrogen substituted barbituric acids were prepared and purified according to their directions, using 0.01 mole of acid and 0.02 mole of *p*-nitrobenzyl bromide. The melting points of most of these derivatives are too high for convenience.

TABLE II

Barbituric acid used	5,5-Bis- <i>p</i> -nitrobenzyl derivatives			
	Formula	M. p.	% Nitrogen Calcd.	% Nitrogen Found
1-Phenyl	C <sub>24</sub> H <sub>18</sub> N <sub>4</sub> O <sub>7</sub>	>295	11.82	12.04
1,3-Diphenyl	C <sub>30</sub> H <sub>22</sub> N <sub>4</sub> O <sub>7</sub>	>300	10.16	10.01
1- <i>p</i> -Tolyl	C <sub>24</sub> H <sub>20</sub> N <sub>4</sub> O <sub>7</sub>	245	11.48	11.43
1,3-Di- <i>p</i> -tolyl	C <sub>32</sub> H <sub>26</sub> N <sub>4</sub> O <sub>7</sub>	>300	9.69	9.75
1,3-Di- <i>o</i> -tolyl	C <sub>32</sub> H <sub>26</sub> N <sub>4</sub> O <sub>7</sub>	>300	9.69	9.57
1- <i>p</i> -Phenetyl	C <sub>26</sub> H <sub>22</sub> N <sub>4</sub> O <sub>8</sub>	240	10.81	11.00

**Aryl Nitrogen Barbituric Acids and Cinnamaldehyde.**—Whiteley<sup>2</sup> describes a number of aldehyde derivatives of 1,3-diphenylbarbituric acid and 1,3-diphenyl-2-thiobarbituric acid. Cinnamaldehyde was used in this study, since its condensation products are only slightly soluble in hot alcohol and separate rapidly from solution after a few minutes of heating. The barbituric acid was dissolved in hot alcohol and a slight excess of cinnamaldehyde added. The bright yellow crys-

tals (brick red in the case of 1,3-di-*o*-tolyl-2-thio-barbituric acid) of the 5-cinnamylidenebarbituric acid were separated from the hot solution by filtration and washed with hot alcohol. The yields are nearly quantitative and enough derivative for melting points can be obtained from 0.2 g. of acid. Unfortunately, most of these cinnamylidene derivatives begin definitely to decompose within about 5° of the temperatures of complete decomposition given in Table III, and the temperature seems to vary somewhat with the rate of heating.

TABLE III

Barbituric acid used	5-Cinnamylidene derivatives			
	Formula	M. p.	% Nitrogen Calcd.	% Nitrogen Found
1-Phenyl	C <sub>19</sub> H <sub>14</sub> N <sub>2</sub> O <sub>3</sub>	271	8.81	8.84
1- <i>p</i> -Tolyl	C <sub>20</sub> H <sub>16</sub> N <sub>2</sub> O <sub>3</sub>	275	8.43	8.48
1,3-Di- <i>p</i> -tolyl	C <sub>27</sub> H <sub>22</sub> N <sub>2</sub> O <sub>3</sub>	260	6.64	6.72
1,3-Di- <i>o</i> -tolyl	C <sub>27</sub> H <sub>22</sub> N <sub>2</sub> O <sub>3</sub>	223	6.64	6.60
1- <i>p</i> -Phenetyl	C <sub>21</sub> H <sub>18</sub> N <sub>2</sub> O <sub>4</sub>	258	7.74	7.73
1,3-Di- <i>o</i> -tolyl-2-thio	C <sub>27</sub> H <sub>22</sub> N <sub>2</sub> O <sub>2</sub> S	248	6.39	6.44

**Aryl Nitrogen Barbituric Acids and Diphenylformamide.**—In this study, only diphenylformamide has been used, since it is so easily prepared and reacts rather more readily with the barbituric acids than do most of the substituted formamides. It yields the 5-anilinomethylene derivatives. The compounds described in Table IV are prepared as follows: 0.01 mole of the barbituric acid is dissolved in hot alcohol, 0.01 mole of diphenylformamide is added and the solution heated. In most cases, the pale yellow needles of the pure 5-anilinomethylene derivative separate rapidly from the hot solution. The crystals are collected on a filter and washed with hot alcohol. Yields are nearly quantitative and sufficient condensation product for melting points can be obtained from 0.2 g. of acid. The compounds melt with only slight decomposition.

TABLE IV

Barbituric acid used	5-Anilinomethylene derivative			
	Formula	M. p., °C.	% Nitrogen Calcd.	% Nitrogen Found
1-Phenyl	C <sub>17</sub> H <sub>12</sub> N <sub>2</sub> O <sub>3</sub>	271	13.69	13.86
1,3-Diphenyl	C <sub>28</sub> H <sub>17</sub> N <sub>2</sub> O <sub>3</sub>	228	10.97	10.77
1- <i>p</i> -Tolyl	C <sub>18</sub> H <sub>14</sub> N <sub>2</sub> O <sub>3</sub>	290	13.09	13.06
1,3-Di- <i>p</i> -tolyl	C <sub>25</sub> H <sub>21</sub> N <sub>2</sub> O <sub>3</sub>	258	10.22	10.17
1,3-Di- <i>o</i> -tolyl	C <sub>25</sub> H <sub>21</sub> N <sub>2</sub> O <sub>3</sub>	198	10.22	10.14
1- <i>p</i> -Phenetyl	C <sub>19</sub> H <sub>17</sub> N <sub>2</sub> O <sub>4</sub>	248	11.97	11.95
1,3-Di- <i>p</i> -phenetyl	C <sub>27</sub> H <sub>25</sub> N <sub>2</sub> O <sub>5</sub>	207	8.91	8.86
1,3-Diphenyl-2-thio	C <sub>28</sub> H <sub>17</sub> N <sub>2</sub> O <sub>2</sub> S	>300	10.52	10.48
1,3-Di- <i>o</i> -tolyl-2-thio	C <sub>28</sub> H <sub>21</sub> N <sub>2</sub> O <sub>2</sub> S	237	9.83	9.79

Of these three classes of reagents, diphenylformamide is the most satisfactory as an identifying

reagent, since the resulting derivatives have definite melting points and are so readily obtained in pure form from small amounts of materials.

### Summary

A number of new nitrogen substituted barbi-

turic acids and some of their derivatives have been described.

Diphenylformamidine is suggested as an identifying reagent for nitrogen substituted barbituric acids.

## The Preparation of Dialkylacetylenes from Acetylenic Grignard Reagents and Alkyl Sulfates<sup>1</sup>

BY S. DOLORETTA THORN, G. F. HENNION AND J. A. NIEUWLAND

### Introduction

As a part of our study of the chemistry of the alkylacetylenes we have been interested for some time in methods of obtaining these conveniently and in pure condition. This paper reports a method for preparing the straight-chain dialkylacetylenes through the agency of the Grignard reagent.

The literature reveals that dialkylacetylenes have been prepared by alkylation of sodium acetylide, by various desaturation reactions and by molecular rearrangement of alkylacetylenes.<sup>2,3</sup> Grignard and Tcheoufaki reported<sup>4</sup> that acetylene monomagnesium bromide and dimagnesium bromide react with alkyl halides to form mono and dialkylacetylenes, respectively, in varying yield.

In our experience the monoalkylacetylene Grignard reagents are quite inert to the simple alkyl halides. In one instance amylacetylene magnesium bromide was refluxed with methyl iodide in dry ether for several weeks without observing alkylation of the Grignard reagent. Attempts to catalyze the reaction with various metals and (or) their salts<sup>5</sup> proved futile. Repetition of the experiment using a mole of methyl sulfate in place of methyl iodide resulted in a vigorous reaction. After treating the product in the usual way, amylacetylene was recovered unchanged. It was subsequently found that the use of two moles of alkyl sulfate per mole of acetylenic Grignard reagent effected smooth alkylation yielding the dialkylacetylene in satisfactory

yield. This is in accord with the experience of Cope<sup>6</sup> and Suter and Gerhart<sup>7</sup> who investigated quantitatively the reaction of alkyl sulfates with other Grignard reagents.

By analogy with the work of these investigators, the equations for the main reactions involved are probably the following

It is likely, however, that the following reactions also occur to some extent giving rise to the same products

Both sets of equations add to the following

Since the procedure used in the preparation of the dialkylacetylenes was uniform, only one typical procedure is described. The physical constants for these compounds are given in Table I. In this table R' is the group originating in the alkyl sulfate.

### Experimental

**Reagents.**—The alkylacetylenes used were prepared by the action of the appropriate alkyl halide on sodium acetylide in liquid ammonia. The ethyl bromide and alkyl sulfates were Eastman Kodak Company products.

**Reaction of Ethyl Sulfate with Butylacetylene Magnesium Bromide.**—To ethylmagnesium bromide (0.5 mole), prepared in the usual manner, 41 g. (0.5 mole) of *n*-butyl-
