h. EtOH (20 mL) was added and the solution was heated at 55–60 °C for 16 h. Dry air was then bubbled into the solution for 4 h while the volume of EtOH was maintained at approximately 15–20 mL. The volume was then reduced to 5–10 mL and chilled to give 398.4 mg (56.1%) of a violet-blue solid. Recrystallization from benzene gave 362 mg (51.0% yield) of amino derivative 7, mp 172–173 °C. Anal. ($C_{27}H_{38}N_4O_5$) C, H, N.

Preparation of the Hydrochloride Salt. To the free amine (271.5 mg) in 100 mL of isopropyl alcohol was added 3 mL of concentrated HCl and the solution was evaporated on a rotary evaporator at 40 °C. Benzene (50 mL) and EtOH (50 mL) were added, and the solution was again evaporated. Then 50 mL of isopropyl alcohol was added and the solution was evaporated. The compound was recrystallized from isopropyl alcohol to give 161.3 mg of the deep blue dihydrochloride, mp 239–240 °C. Anal. ($C_{27}H_{38}Cl_2N_4O_5 \cdot 0.5H_2O$) C, H, N, Cl.

Growth Inhibition Studies. IC₅₀ Determinations. Leukemia L1210 cells were diluted to a concentration of 1×10^5 cells/mL in RPMI 1640 plus 20% HI-FCS plus 20 mmol Hepes. Cells were distributed into 13×100 mm sterile, borosilicate-glass culture tubes and randomized before 1-mL aliquots of test compound or control solution were added. This 1:2 dilution of cells with test solution resulted in a final inoculum of 5×10^4 cells/mL in a 2-mL total volume of RPMI 1640 plus 10% HI-FCS 20 mmol Hepes. Tubes were stoppered with silicon stoppers and incubated in an upright position in a 37 °C incubator for 48 h.

Following incubation, growth (cells/mL) was determined with a Coulter electronic cell counter. Calculations and graphing of data were performed with an Apple computer. For each concentration of compound, the program averaged the triplicates and calculated the percent control growth. The percent control growth was plotted versus compound concentration and the $\rm IC_{50}$ value was determined.²⁵ Human nonsmall cell lung carcinoma H125, human breast carcinoma MCF7, human ovarian carcinoma A121, and human colon carcinoma WiDr cells (NCI Tumor Repository, Frederick MD) were harvested from stock cultures and added (1000–3000 cells/well) to 96-well tissue culture trays. Drug was added to each column (eight replicates) of wells in a stepwise fashion to achieve final drug concentrations ranging from 10^{-4} to 10^{-8} M. Cell growth inhibition was determined 3–5 days later with a microculture tetrazolium assay (MTT), which was based on the enzymatic reduction of colorless MTT to a purple formazan product soluble in DMSO. Absorbance at 570 nm was proportional to cell number.²⁶ Color formation was measured with a Biotech plate reader and data analysis was performed by an IBM software system. The drug concentration which inhibits 50% of tumor growth (IC₅₀) was determined.

Therapeutic Efficacy of 7 in Mice with L1210 Leukemia. Groups of 5 DBA/2J mice were inoculated ip with 10⁶ L1210 leukemia cells and demonstrated a statistically significant (p < 0.01), 38% increase in life span following the daily ip administration of 5 mg/kg of 7 (day 1–5). A group of 20 control mice showed survival times ranging between 6 and 8 days with a median of 7 days and a mean of 6.6 ± 0.13 . Dosages above 20 mg/kg × 5 were toxic, resulting in loss of animal weight and early death.

These results are comparable to reported work where CD2F_1 mice inoculated with 10^5 L1210 leukemia cells and treated with 3.1 mg/kg DHAQ on days 1, 5, and 9 showed a 43% ILS.¹⁸

Synthesis and Antihypertensive Activity of 4-(1,2-Dihydro-2-oxo-1-pyridyl)-2*H*-1-benzopyrans and Related Compounds, New Potassium Channel Activators

Rolf Bergmann and Rolf Gericke*

Preclinical Pharmaceutical Research, E. Merck, Frankfurter Strasse 250, D-6100 Darmstadt, West Germany. Received April 10, 1989

The synthesis and antihypertensive activity of 4-(1,2-dihydro-2-oxo-1-pyridyl)-2H-1-benzopyran-3-ols are described. The unsubstituted pyridone adduct lead compound 7e is highly active, with substituents on the pyridone ring leading to a decrease in activity. Strongly electron-withdrawing substituents at the C-6 position are required for optimal activity. When the 2-pyridone ring is replaced by other heterocycles such as 4-pyridone, pyrimidone, pyridazinone, pyrazinone, and 1,4-butanesultam, the activity is maintained. The removal of the 3-hydroxy function (\rightarrow 17a) does not significantly reduce the activity. The elimination of water from the chromanols leads to the formation of the chromenes, which are among the most potent antihypertensives known. The influence of diverse substituents, in particular heterocyclic C-6 substituents, was investigated in the 4-(2-oxo-1-pyrrolidinyl)chroman-3-ol series. Chromanols esterified at the 3-hydroxy group with short-chain acids, maintain their activity. The epoxidation of the chromene double bond also produces active compounds. The rearrangement of the epoxides 22 produces the 3-keto compounds 23 and the enol derivatives 25. The reduction of the ketone 23a produces *cis*-chromanol 7ab along with its trans isomer 7e. All compounds were tested for oral antihypertensive activity in spontaneously hypertensive rats with a dose of 1 mg/kg; for selected compounds ED₃₀ values as well as the duration of the antihypertensive effect were determined. 4-(1,2-Dihydro-2-oxo-1-pyrridyl)-2,2-dimethyl-2H-1-benzopyran-6-carbonitrile (18a) is under development as a coronary vasodilator and a drug for treating angina pectoris.

Sodium channel blockers have been used for many years as local anesthetics and antiarrhythmics. Subsequently calcium channel blockers underwent a vigorous development resulting in a number of drugs that are now widely used in a range of indications. Currently there is a growing interest in the therapeutic potential of substances that modulate potassium channels.¹ There are three prototypes of this class of compounds: Pinacidil, a peripheral vasodilator; Nicorandil, an antianginal agent, and Cromakalim (20a), a highly potent antihypertensive drug.

Evans et al.² were able to show that the existence of a powerful electron-withdrawing group located at C-6 in benzopyran compounds as well as a 4-(cyclic amido) group is essential for good blood-pressure-lowering action in the

spontaneously hypertensive rat (SHR). While Evans et al. only described saturated 4-(cyclic amido) groups such as 2-pyrrolidinone and 2-piperidinone, we were surprised to find that these groups can be replaced by unsaturated 6-membered-ring heterocycles such as 2-pyridone, 4pyridone, 6-pyridazinone, pyrimidone, and pyrazinone. All these heterocycles can be substituted by different ligands.

Chemistry

The (\pm) -epoxides $5^{2,3}$ served as starting materials for the synthesis of new 4-heterocyclic substituted 2H-1-benzopyran-3-ols shown in Tables I and II. 3,4-Epoxy-3,4-dihydro-2,2-dimethyl-6-(4-pyridyl)-2H-1-benzopyran was prepared from 4-(4-pyridyl)phenol⁴ in the usual way. In the case of spiro compounds 5a-d the 2-spirocyclical substituted 4-chromanones 2 were prepared either from 3-acetyl-4-hydroxybenzonitrile⁵ or from 6'-hydroxy-3'nitroacetophenone⁶ by Kabbe's⁷ method (Scheme I; only relative stereochemistry is shown). Borohydride reduction (\rightarrow 3) and dehydration⁸ with an acidic catalyst produced

is also suitable for the preparation of analogous compounds such as **5e**.

When the epoxides 5 are reacted with 2-pyridones 6 with pyridine in alcohol, the main products are the (\pm) -trans-3,4-dihydro-4-(1,2-dihydro-2-oxo-1-pyridyl)-2H-1-benzopyran-3-ols 7, frequently obtained directly in pure crystalline form (Table I). The byproducts, the (\pm) -trans-3,4-dihydro-4-(2-pyridyloxy)-2H-1-benzopyran-3-ols 8, were only isolated in a few cases. When necessary, 7 and 8 can easily be separated by chromatography on silica gel because of the great difference in polarity.

The amines 7n and 7p were prepared by catalytic hydrogenation of the nitro compounds 7i and 7j, respectively. The thioamide 7x was prepared by H_2S addition to the nitrile 7e and the aldehyde 7ac was also produced from 7e by transfer hydrogenation using Raney nickel/hypophosphite.¹⁰ The Wittig-Horner products 7ae and 7af were obtained from the aldehyde 7ac with the (4-cyanobenzyl)phosphonate and the (cyanomethyl)phosphonate. The examples 9a-n in Table II show that not only 2pyridones but also 4-pyridones, pyridazinones, pyrimidones, pyrazinones, 1,4-butanesultames, and others can be reacted with the epoxide 5e, also under standard conditions with pyridine/ethanol. For the reaction of 5e with 4piperidone hydrate hydrochloride (\rightarrow 9b) and pyrimidin-2-ol hydrochloride (\rightarrow 9m), triethylamine and an excess of sodium ethoxide, respectively, were used as the base instead of pyridine. The reaction of 5e with 1,4,5,6tetrahydropyridazin-6-one¹¹ (\rightarrow 9g) was carried out according to the method of Evans et al.² (DMSO/NaH).

When 5e is treated with pyrimidin-4-ol, the two possible isomers 9h and 9i are formed in almost equal quantities. The structures were determined by the calculation of increments in the chemical shifts of the pyrimidone protons and comparison with the measured NMR values. Differentiation is also possible, as all the 2-pyridone compounds 7 and their analogues, in contrast to the corresponding 4-pyridone compounds, produce a double set of signals in the NMR spectrum at room temperature in DMSO, which indicates a mixture of conformers. If the temperature is increased to approximately 100 °C, the rotational barriers are overcome, and the NMR spectra show only a single set of signals.

When **5e** is treated with 3-pyridinol under the standard conditions (Scheme II), no charge compensation is possible; betaine **10** is formed in high yield along with minimal O-alkylation product **11**. Under similar conditions with phenol, **12** is obtained in low yield. The cyclic amidines **15** were successfully prepared from 4-chlorobutyronitrile or 5-chlorovaleronitrile and 4-amino-3,4-dihydro-2*H*-1Scheme III

benzopyran-3-ols 13 (Scheme III). The intermediate compounds 14 were not observed under the drastic reaction conditions used, and the resultant products 15a and 15c were subsequently acylated to afford 15b and 15d, respectively. To produce the 4-substituted 3,4-dihydro-2H-1-benzopyran compounds 17, the alcohol 3e was converted with PBr₃ into the bromide 16, which then reacted with 2- or 4-pyridone (Scheme IV).

The 4-substituted 2H-1-benzopyran compounds 18 and 19 (Table III) were mainly prepared from the corresponding chromanol precursors 7 or 9 by brief refluxing in THF or dioxane containing solid sodium hydroxide. The amine 18f was produced by hydrogenation of 18e and acetylated to give 18g. Aldehyde 18k was obtained by transfer hydrogenation of 18a, and thioamide 18m was prepared by treatment of nitrile 18a with H₂S. The ester 18j was obtained by Pinner synthesis,¹² the amide 18u by alkaline hydration of the nitrile 18a.

With 3,4-dihydro-3-hydroxy-2,2-dimethyl-4-(2-oxo-1pyrrolidinyl)-2H-1-benzopyran-6-carbonitrile (20a) or the corresponding 6-formyl,² 6-amino, or 6-carbamoyl compounds³ as the starting material, the 6-substituted derivatives in Table IV were synthesized. The benzimidazol derivative 20c was synthesized from aldehyde 20 (R =CHO) and 1,2-phenylenediamine.¹³ The aza analogues 20b and 20d were synthesized from the corresponding diaminopyridines. The heterocyclic derivatives 20f, 20j, and 201 were obtained by condensation of the thioamide 20e, the amide 20 ($R = CONH_2$), or the thiourea 20k with chloroacetone. The thioamide 20e was obtained by addition of H_2S to nitrile 20a, and 20k was synthesized from amine 20 ($R = NH_2$) with sodium thiocyanate.¹⁴ The Schiff bases 20g-i were generated by condensation of the amine with the corresponding aromatic aldehydes. The addition of sodium azide to nitrile 20a gave the tetrazol

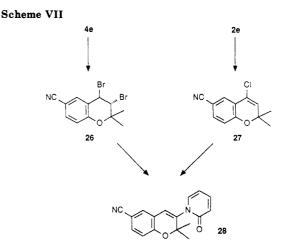

Scheme VI

20m. The addition of methanol to **20a** under acidic conditions afforded the relatively stable imino ether **20n** as the hydrochloride, which was the intermediate product of the imidazoline derivative **20o** formed in the reaction with ethylenediamine.¹⁵ The 4-pyridyl compound **20p** was obtained from 3,4-epoxy-3,4-dihydro-2,2-dimethyl-6-(4-pyridyl)-2*H*-1-benzopyran with 2-pyrrolidinone.

While the 3-OH group of the chromanols 7 is easily acylated (see Scheme V), it resists all attempts at oxidation to the keto compound. However, with 3-chloroperbenzoic acid, it is possible to epoxidize the chromene compounds 18 to the corresponding 3,4-epoxy compounds 22a-c (Scheme VI). Because the epoxides are in the same oxidation state as the desired keto compounds, it was possible to convert 22a directly to 23a under strongly acidic conditions. It is interesting to note that the epoxide 22a opens quite differently in the presence of a catalytic amount of tetrakis(triphenylphosphine)-palladium(0). With Pd(0), or better still with ammonia, 3,4-dihydro-2,2-dimethyl-4oxo-3-(2-pyridyloxy)-2H-1-benzopyran-6-carbonitrile (24)¹⁶ is obtained in a rearrangement reaction in high yield. The ketone 23b was prepared from the nitrile 23a by a Pinner reaction. In the reduction of the ketone 23a with sodium borohydride, cis-3,4-dihydro-4-(1,2-dihydro-2-oxo-1pyridyl)-3-hydroxy-2,2-dimethyl-2H-1-benzopyran-6carbonitrile (7ab) is obtained together with the trans compound 7e in a ratio of 1:8 (HPLC). In the NMR spectrum of 23a, it can be seen that the ketone is to some extent in equilibrium with its enol form 25a that can easily be converted to its acetate (25b) or ether (25c).

All attempts to obtain the chromene 18a directly from the dibromo compound 26 or the vinyl chloride 27 by reaction with 2-pyridone failed. The attack of the nucleophile always occurred at C-3 to form the new compound 28^{16} (Scheme VII). It is assumed that a Michael-type addition took place with subsequent elimination. The dibromide 26 was generated from the chromene 4e and the vinyl chloride 27 from the chromanone 2e with use of phosphorus pentachloride.

Results and Discussion

The antihypertensive effect of the compounds was determined after oral administration to conscious spontaneously hypertensive rats. Direct and indirect techniques for recording blood pressure were used.

The 4-heterocyclic substituted chroman-3-ols are listed in Tables I and II. Substitution on the 2-pyridone ring usually led to a loss of activity. The unsubstituted compounds 7e and 7h are highly active, the 4-methoxy-substituted 7z shows moderate activity, while all other compounds are weakly active or inactive. The *trans*-chromanol 7e is considerably more potent than the corresponding cis product 7ab. In agreement with previous findings,² a powerful electron-withdrawing group, particularly a nitro or cyano group (7h, 7e), located at C-6 is required for optimal antihypertensive activity. The methyl ketone 7f, the methyl ester 7o, the 4-pyridyl compound 7q, and the vinylogous nitrile 7af are considerably weaker. The ethyl ester 7k, the thioamide 7x, the aldehyde 7ac, and the compound 7ae are inactive.

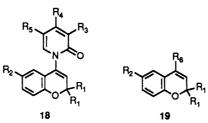

The effect of replacing the 2-pyridone group with other heterocycles is shown in Table II. Moderate blood pressure reductions were obtained with the pyridazinone compound 9f, the corresponding partially hydrogenated compound 9g, and the pyrazinone chromanol 9l. Other compounds with an oxo function at the α -position in the 4-heterocycle such as pyrimidones 9i and 9m or the uracil derivative 9d were either weakly active or inactive. This led us to the important question as to whether the 2-oxo function is essential to the pharmacological action in this class of substances. The change from the 2-pyridone compound 7e to its corresponding 4-analogue 9e resulted in a loss of activity. Further, we found the piperidinone compound 9b inactive, while Evans et al. described the corresponding 2-analogue as strongly active.² The replacement of the CO group by a SO₂ group (\rightarrow 9k) also led to a reduction in activity. As mentioned, the introduction of substituents or the attachment of rings by condensation resulted in a reduction of the activity (compare 9e with 9a, 7e with 9c, 9f with 9j or 9n).

A comparison of the chromene structures (Table III) with the corresponding racemic chromanols indicates that

the antihypertensive action of the chromenes was significantly stronger in most cases. This applies to the 4-(1,2-dihydro-2-oxo-1-pyridyl)-2H-1-benzopyrans with substituents at C-6 such as nitriles ($7e \rightarrow 18a$), the methyl

ketones $(7f \rightarrow 18b)$, the nitro compounds $(7h \rightarrow 18d)$, the methyl esters $(7o \rightarrow 18j)$, and the brominated compounds $(7ag \rightarrow 18v)$. Among the highly active compounds in Table III, there are some in which the 2-pyridone group

is substituted such as the 5-amino compound 18f and the 4-methoxy and 4-ethoxy derivatives 18q and 18r, which should be compared with 7n, 7z, or 7aa. As in the chromanol series, however, all the substituted compounds were weaker than 18a. It should still be mentioned that the influence of C-6 substituents in the pyridone ring could not be investigated as these substances have not been accessible by synthesis so far. The pyrazinone derivative 19f was found to be more active than alcohol 9l but less than the pyridone derivative 18a. The spirocyclic compounds 7a-d, 18n, 18o, 18s, and 18t showed only token activity in their chromene form. The reason for the increase in potency with the change from the chromanols to the chromenes, which was in some cases extreme (7aa \rightarrow 18r, 7ag \rightarrow 18v), is still unclear. A series of exceptions (7m, 7q, 9c, 9f, 9k vs 18i, 18l, 19b, 19c, 19g) to the trend described made an explanation even more difficult.

The attempt to exceed the potency of 20a by replacing the nitrile group with new substituents, particularly with heterocyclic groups, met with little success (Table IV). Only the imino ether 20n showed hypotensive action similar to that of Cromakalim. All the other compounds were either only weakly effective (20e, 20g, 20p) or inactive altogether. Replacement of the oxo function in 20a by an imino function (15a) surprisingly resulted in complete loss of activity. This also applied to the analogues 15b-e (Scheme III, Table V). Also inactive were the products with oxygen at C-4 (chromanols 8, 11, and 12; Schemes I, II), which were formed in small quantities, as well as the betaine 10.

Removal of the 3-hydroxy group from the chromane system resulted in a slightly less potent compound (17a). After esterification of the hydroxy group with short-chain acids (Scheme V) high potency was retained particularly with the formates (compare 21a with 7e and 21c with 7h), while in the case of the acetate 21b a reduction was observed. The epoxides 22a and 22b also possess good activity, the nitro compound 22b being equivalent in its potency even to the corresponding highly potent alcohol 7h (Scheme VI, Table V). It is therefore surprising to find that the ketone 23a along with its tautomeric form 25a, obtained by isomerization from 22a, lost practically all of their potency. The activity of the enforced enol forms (25b, 25c) remained at the same low level. The new structure 24 was inactive.

Antihypertensive ED_{30} values were used to compare the relative potencies of selected compounds (Table VI). The group of the chromenes contains the most active compounds, with 4-(1,2-dihydro-2-oxo-1-pyridyl)-2,2-dimethyl-6-nitro-2H-1-benzopyran (18d) $[ED_{30} = 0.83 \,\mu g/kg]$ being the most potent, which promises to be one of the most active of all hypotensive substances known to date. This is followed in potency by the corresponding nitrile 18a, the methyl ketone 18b, the compound 18r substituted with an ethoxy group in the pyridone ring, and the pyrazinone derivative 19f. However, the group of the chromanols also contains substances with remarkable ED_{30} values such as pyrazinone 91, the nitro compound 7h, and the formate 21a. All of these compounds are far superior in potency to Cromakalim (20a). Substances with particularly shallow dose/response curves are the chromanols 91 and 9f, while the brominated compound 18v has a steeper curve. The ratio ED_{30} (20 h)/ ED_{30} (2 h) gives a reference to the period of activity of the individual substances. We found that the most potent substance 18d has the shortest period of activity while, for instance, the pyridazinone compounds 9f and 9g demonstrate prolonged activity.

The new group of benzopyran derivatives belongs to the class of compounds modulating the potassium channels. Similar to the other substances in this class,¹ they possess the ability to hyperpolarize smooth muscle cell membranes.^{17,18} The hyperpolarization is responsible for the

relaxant effects in the smooth muscle and thus also for vasodilation. Thus it is not surprising that the relative potencies in hyperpolarization, relaxation, and antihypertension of the individual substances are approximately similar.

In further studies¹⁹ hypotensive and nonhypotensive doses of 4-(1,2-dihydro-2-oxo-1-pyridyl)-2,2-dimethyl-2H-1-benzopyran-6-carbonitrile (18a = EMD 52 692) showed potent coronary artery dilation in vivo. Gross et al.²⁰ were able to show that in anesthetized dogs subjected to an acute coronary artery occlusion, the collateral blood flow in the ischemic area was increased by low doses of 18a, which influenced neither the circulation in the nonischemic

regions of the heart nor the blood pressure. For this reason, the development of 18a as a coronary vasodilator and antianginal drug has been initiated.

Experimental Section

Melting points were determined with a Büchi 535 melting point apparatus and are uncorrected. IR, NMR, and mass spectra, which were in agreement with the structures cited, were recorded on a Bruker 85 FT-IR spectrometer, a Bruker AC 200 or WM 250 (TMS as internal standard), and a Vacuum Generators VG 70-70 or 70-250 at 70 eV, respectively. Elemental analyses were conducted with a Perkin-Elmer-240 B-CHN analyzer. Precoated silica gel 60 F₂₅₄ plates with a layer thickness of 0.25 mm from E. Merck, Darmstadt were used for thin-layer chromatography. Yields are not optimized.

3',4'-Dihydro-4'-oxospiro[cyclohexane-1,2'-[2H][1]benzopyran]-6'-carbonitrile (2c). 3-Acetyl-4-hydroxybenzonitrile (37.5 g, 0.23 mol), cyclohexanone (29 g, 0.3 mol), and pyrrolidine (5 mL, 60 mmol) were refluxed in absolute PhMe (180 mL) for 2 h with a Dean–Stark apparatus. The solvent was evaporated and the residue purified by chromatography (silica gel, CH₂Cl₂). The homogeneous fractions were combined (50.5 g, 90%) and a part recrystallized from (Me₂CH)₂O: mp 92–94 °C; NMR (DMSO-d₆) δ 1.6 (m, 8 H), 1.9 (m, 2 H), 2.89 (s, 2 H), 7.23 (d, 8.8, 1 H), 7.96 (dd, 8.8, 1.7, 1 H), 8.10 (d, 1.7, 1 H). Anal. (C₁₅H₁₅NO₂) C, H, N.

Spiro[cyclohexane-1,2'-[2H][1]benzopyran]-6'-carbonitrile (4c). Ketone 2c (50.5 g, 0.21 mol) in MeOH (800 mL) was reduced with NaBH₄ (11 g, 0.29 mol). The solvent was evaporated, and the residue was taken up in H₂O (300 mL) and extracted three times with Et₂O. The combined ether extracts were dried and evaporated, yielding a gum consisting of 3',4'-dihydro-4'hydroxyspiro[cyclohexane-1,2'-[2H][1]benzopyran]-6'-carbonitrile (3c), 50 g (98%). The crude 3c (50 g, 0.21 mol) and p-toluenesulfonic acid hydrate (2.2 g, 11.6 mmol) were refluxed in PhMe (700 mL) for 4 h with a Dean–Stark apparatus. The solvent was evaporated and the residue crystallized from Me₂CHOH to yield 4c: 36 g (78%); mp 94–95 °C; NMR (DMSO-d₆) δ 1.6 (m, 8 H), 1.8 (m, 2 H), 5.90 (d, 10.2, 1 H), 6.47 (d, 10.2, 1 H), 6.92 (d, 8.4, 1 H), 7.56 (m, 2 H). Anal. (C₁₅H₁₅NO) C, H, N.

3',4'-Epoxy-3',4'-dihydrospiro[cyclohexane-1,2'-[2H][1]benzopyran]-6'-carbonitrile (5c). 3-Chloroperbenzoic acid (85%; 12.5 g, 61.6 mmol) dissolved in CH₂Cl₂ (80 mL) was added dropwise to a solution of 4c (13.5 g, 60 mmol) in CH₂Cl₂ (100 mL) at 5 °C. After the mixture was stirred overnight at room temperature, a precipitate was filtered off. The remaining solution was evaporated and the residue purified by chromatography (silica gel, CH₂Cl₂/petroleum ether, 75:25), affording 8.5 g (59%) of 5c: mp 54-56 °C; NMR (CDCl₃) δ 1.3-1.9 (m, 10 H), 3.55 (d, 4, 1 H), 3.89 (d, 4, 1 H), 6.91 (d, 7.7, 1 H), 7.54 (dd, 7.7, 1.7, 1 H), 7.65 (d, 1.7, 1 H). Anal. (C₁₅H₁₅NO₂) C, H, N.

General Procedure for Compounds of Tables I and II. 3,4-Dihydro-4-(1,2-dihydro-2-oxo-1-pyridyl)-3-hydroxy-2,2dimethyl-2H-1-benzopyran-6-carbonitrile (7e). The epoxide 5e (30 g, 0.15 mol), 2-pyridone (22 g, 0.23 mol), and pyridine (10 mL, 0.12 mol) were heated in refluxing EtOH (100 mL) for 2 h. After cooling, 7e (27 g, 61%) was collected by filtration: mp 245-246 °C from Me₂CHOH; NMR (CDCl₃) δ 1.30 (s, 3 H), 1.49 (s, 3 H), 3.82 (dd, 10.2, 4.9, 1 H), 4.15 (d, 4.9, 1 H), 6.23 (td, 7.4, 1.7, 1 H), 6.35 (d, 10.2, 1 H), 6.63 (d, 7.4, 1 H), 6.87 (dd, 7.4, 1.7, 1 H), 6.95 (d, 8.4, 1 H), 7.06 (s br, 1 H), 7.40 (td, 7.4, 1.7, 1 H), 7.47 (dd, 8.4, 1.7, 1 H). Anal. (C17H16N2O3) C, H, N. The mother liquor was evaporated and the residue chromatographed (silica gel, Et₂O/EtOAc, 1:1), yielding 11.5 g (26%) of oily 3,4-dihydro-3-hydroxy-2,2-dimethyl-4-(2-pyridyloxy)-2H-1-benzopyan-6-carbonitrile (8, $R_1 = Me$, $R_2 = CN$, $R_3-R_5 = H$), which crystallized after standing for some time: mp 102-103 °C from (Me₂CH)₂O; NMR (CDCl₃) & 1.35 (s, 3 H), 1.58 (s, 3 H), 3.95 (d, 7.7, 1 H), 5.79 (d, 7.7, 1 H), 6.49 (s br, 1 H), 6.90 (d, 8.4, 1 H), 7.00 (d, 7.7, 1 H), 7.05 (dd, 4.9, 1.5, 1 H), 7.49 (dd, 7.7, 1.7, 1 H), 7.69 (s br, 1 H), 7.75 (td, 7.7, 1.7, 1 H), 8.15 (dd, 4.9, 1.5, 1 H). Anal. $(C_{17}H_{16}N_2O_3)$ C, H, N.

trans 4-(3-Amino-1,2-dihydro-2-oxo-1-pyridyl)-3,4-dihydro-3-hydroxy-2,2-dimethyl-2*H*-1-benzopyran-6-carbonitrile (7p). The nitro compound 7j (1 g, 2.9 mmol) was hydrogenated in MeOH (50 mL) with Pd/C (5% Pd; 500 mg). The catalyst was filtered off and 7p (440 mg, 47%) was obtained as a crystalline solid after evaporation; mp 213-215 °C. Anal. $(C_{17}H_{17}N_3O_3 \cdot 0.6H_2O)$ C, H, N.

trans -3,4-Dihydro-4-(1,2-dihydro-2-oxo-1-pyridyl)-3hydroxy-2,2-dimethyl-2*H*-1-benzopyran-6-carbothioamide (7x). H₂S was passed through a solution of 7e (2 g, 6.7 mmol) in pyridine (12 mL) and NEt₃ (6 mL) at 130 °C for 12 h. The solvents were distilled off, and the residue was crystallized from MeOH/EtOAc, 1:1. This yielded 1.4 g (61%) of 7x, mp 226–228 °C (MeOH). Anal. ($C_{17}H_{18}N_2O_3S$ -0.5 H_2O) C, H, N, S.

trans -3,4-Dihydro-4-(1,2-dihydro-2-oxo-1-pyridyl)-3hydroxy-2,2-dimethyl-2H-1-benzopyran-6-carbaldehyde (7ac). Compound 7e (1 g, 3.4 mmol), sodium hypophosphite hydrate (2 g, 11.4 mmol), and Raney nickel (400 mg) were stirred in a mixture of H₂O (10 mL), acetic acid (10 mL), and pyridine (20 mL) at 40-45 °C for 6 h. The catalyst was removed, and H₂O (100 mL) was added to the filtrate. The solution was extracted with Et₂O; the Et₂O phase was evaporated and the residue chromatographed (silica gel; Et₂O \rightarrow EtOAc). The homogeneous fractions were combined to give 200 mg (20%): mp 222-224 °C; NMR (DMSO-d₆, 90 °C) δ 1.29 (s, 3 H), 1.50 (s, 3 H), 4.17 (d, 9.5, 1 H), 5.79 (s br, 1 H), 6.19 (td, 6.5, 1.0, 1 H), 6.41 (d, 8.5, 1 H), 6.93 (d, 7.7, 1 H), 7.17 (d, 1.0, 1 H), 7.31-7.40 (m, 3 H), 7.65 (dd, 7.7, 1.0, 1 H), 9.7 (s, 1 H). Anal. (C₁₇H₁₇NO₄·0.2H₂O) C, H, N.

3-[trans-3,4-Dihydro-4-(1,2-dihydro-2-oxo-1-pyridyl)-3hydroxy-2,2-dimethyl-2H-1-benzopyran-6-yl]acrylonitrile (7af). Under N₂, NaH (80%, 300 mg, 10 mmol) was added to diglyme (4 mL), and then diethyl (cyanomethyl)phosphonate (600 mg, 3.4 mmol) followed by aldehyde 7ac (1 g, 3.3 mmol) dissolved in diglyme (3 mL) was added dropwise, and the mixture was stirred for 3 h at room temperature. The solution was poured into H₂O (50 mL) and extracted three times with EtOAc (30-mL portions). The combined organic phase was dried and evaporated. The residue was eluted through a silica gel column (Et₂O \rightarrow EtOAc); the chromatographically homogeneous fractions were combined and crystallized from Et_2O . 7af: yield 130 mg (12%); mp 190–192 °C; NMR (DMSO- d_6 + CF₃CO₂D, 90 °C) δ 1.29 (s, 3 H), 1.49 (s, 3 H), 4.14 (d, 9.5 1 H), 5.82 (s br, 1 H), 5.91 (dd, 15.5, 1.0, 1 H), 6.25 (td, 6.0, 1.0, 1 H), 6.50 (d, 9.0, 1 H), 6.90 (m, 2 H), 7.32-7.52 (m, 4 H). Anal. (C₁₉H₁₈N₂O₃) C, H, N.

trans -3,4-Dihydro-3-hydroxy-2,2-dimethyl-4-(4-oxo-1piperidinyl)-2H-1-benzopyran-6-carbonitrile (9b). Epoxide 5e (1 g, 5 mmol), 4-piperidone hydrate hydrochloride (480 mg, 5.5 mmol), and Et₃N (1.4 mL, 10.1 mmol) were heated at reflux in EtOH (10 mL) for 2 days. The reaction mixture was evaporated, and the residue was redissolved in CH₂Cl₂ and washed twice with H₂O. After drying, the organic phase was evaporated and chromatographed (silica gel, petroleum ether \rightarrow Et₂O) to yield 170 mg (11%) of 9b: mp 142–145 °C; NMR (DMSO-d₆) δ 1.15 (s, 3 H), 1.41 (s, 3 H), 2.4 (m, 4 H), 3.0 (m, 4 H), 3.75 (dd, 10, 6.8, 1 H), 3.89 (d, 10, 1 H), 5.59 (d, 6.8, 1 H), 6.91 (d, 8.0, 1 H), 7.61 (dd, 8.0, 1.6, 1 H), 8.15 (d, 1.6, 1 H). Anal. (C₁₇H₂₀N₂O₃) C, H, N.

trans -3,4-Dihydro-4-(1,4,5,6-tetrahydro-6-oxo-1pyridazinyl)-3-hydroxy-2,2-dimethyl-2H-1-benzopyran-6carbonitrile (9g). Epoxide 5e (13 g, 65 mmol), 1,4,5,6-tetrahydropyridazin-6-one (6.5 g, 66.2 mmol), and NaH (80%; 1.95 g, 65 mmol) were stirred in DMSO (200 mL) for 2 h at room temperature under N₂ atmosphere. The reaction mixture was then poured into H₂O (1 L) and the aqueous solution was extracted twice with CH₂Cl₂ (500 mL). The organic phase was washed with H₂O, dried, evaporated, and chromatographed (silica gel, CH₂Cl₂ \rightarrow EtOAc); the chromatographically homogeneous fractions were combined. 9g: yield 1.3 g (7%); mp 163-165 °C; NMR (CDCl₃) 3 1.25 (s, 3 H), 1.47 (s, 3 H), 2.5-2.8 (m, 4 H), 2.75 (d, 6.7, 1 H), 4.02 (dd, 9.8, 6.7, 1 H), 5.75 (d, 9.8, 1 H), 6.84 (d, 8.8, 1 H), 7.14 (m, 1 H), 7.24 (d, 2.8, 1 H), 7.39 (dd, 8.8, 2.8, 1 H). Anal. (C₁₈H₁₇N₃O₃) C, H, N.

trans-3,4-Dihydro-4-(1,4-dihydro-4-oxo-1-pyrimidinyl)-3hydroxy-2,2-dimethyl-2H-1-benzopyran-6-carbonitrile (9h) and trans-3,4-Dihydro-4-(1,6-dihydro-6-oxo-1-pyrimidinyl)-3-hydroxy-2,2-dimethyl-2H-1-benzopyran-6-carbonitrile (9i). Epoxide 5e (6 g, 29.8 mmol), pyrimidin-4-ol (4.4 g, 45.8 mmol), and pyridine (2.2 mL, 27.3 mmol) were heated at reflux in EtOH (200 mL) for 6 h. The hot solution was filtered and evaporated, and the residue was chromatographed (silica gel. $CH_2Cl_2 \rightarrow MeOH$), giving 9i followed by 9h. 9h: yield 1.43 g (16%); mp 307-310 °C; NMR (DMSO-d₆) & 1.21 (s, 3 H), 1.46 (s, 3 H), 3.86 (m, 10, 6.1, 1 H), 5.17 (d, 10, 1 H), 6.02 (d, 7.7, 1 H), 6.16 (d, 6.1, 1 H), 7.03 (d, 8.5, 1 H), 7.52 (d, 2.0, 1 H), 7.56 (dd, 7.7, 2.7, 1 H), 7.69 (dd, 8.5, 2.1, 1 H), 8.39 (d, 2.7, 1 H). Anal. (C₁₆H₁₅N₃O₃) C, H, N.

9i: yield 1.88 g (21%); mp 207-208 °C; NMR (DMSO-d₆, 390 K) δ 1.24 (s, 3 H), 1.48 (s, 3 H), 4.26 (d, 9.8, 1 H), 5.39 (d, 9.8, 1 H), 6.34 (d, 6.6, 1 H), 6.94 (d, 8.5, 1 H), 7.17 (m, 1 H), 7.52 (dd, 8.5, 2.3, 1 H), 7.89 (d, 6.6, 1 H), 8.34 (s br, 1 H). Anal. (C₁₆-H₁₅N₃O₃) C, H. N.

trans-3,4-Dihydro-4-(1,2-dihydro-2-oxo-1-pyrimidinyl)-3hydroxy-2,2-dimethyl-2H-1-benzopyran-6-carbonitrile (9m). Na (460 mg, 20 mmol) followed by pyrimidin-2-ol hydrochloride (2.6 g, 19.6 mmol) were placed in EtOH (100 mL) under N₂. The solution was heated to boiling and the epoxide 5e (4 g, 19.9 mmol) added and refluxing continued for 6 h. The hot mixture was then filtered, and the crystals were separated from the cooled solution (4 g, 68%), mp 252-253 °C. Anal. (C₁₆H₁₅N₃O₃) C, H, N.

trans-3,4-Dihydro-3-hydroxy-2,2-dimethyl-4-(3-oxidopyridinio)-2H-1-benzopyran-6-carbonitrile (10) and trans-3,4-Dihydro-3-hydroxy-2,2-dimethyl-4-(3-pyridyloxy)-2H-1benzopyran-6-carbonitrile (11). The epoxide 5e (6 g, 29.8 mmol), 3-pyridinol (3 g, 31.5 mmol), and pyridine (3 mL, 37.2 mmol) were heated at reflux for 4 h in EtOH (120 mL). The solution was reduced to half the volume and cooled. The precipitated crystals 10 were isolated, yield 6.5 g (74%). A portion was recrystallized from MeOH/3% H₂O: mp 196-199 °C; NMR $(DMSO-d_6 + TFA), \delta 1.28 (s, 3 H), 1.52 (s, 3 H), 4.16 (d, 9.8, 1)$ H), 5.94 (d, 9.8, 1 H), 7.12 (d, 8.4, 1 H), 7.53 (s br, 1 H), 7.76 (dd, 8.4, 1.7, 1 H), 7.92–8.14 (m, 2 H), 8.40–8.80 (d br, 2 H). Anal. $(C_{17}H_{16}N_2O_3\cdot 0.5H_2O)$ C, H, N. The mother liquor was evaporated to a residue and chromatographed (silica gel, $EtOAc \rightarrow MeOH$), and the chromatographically homogeneous fractions of substance 11 were combined; yield 1.2 g (14%). A part was recrystallized from EtOAc: mp 204-206 °C; NMR (DMSO- d_6) δ 1.32 (s, 3 H), 1.4 (s, 3 H), 3.80 (m, 1 H), 5.40 (d, 6.3, 1 H), 5.94 (d, 6.0, 1 H) 6.99 (d, 8.1, 1 H), 7.41 (dd, 8.1, 4.2, 1 H), 7.60-7.80 (m, 3 H), 8.26 (d br, 4.2, 1 H), 8.51 (d br, 2.8, 1 H). Anal. $(C_{17}H_{16}N_2O_3)$ C, H, N.

trans-3,4-Dihydro-3-hydroxy-2,2-dimethyl-4-phenoxy-2H-1-benzopyran-6-carbonitrile (12). Epoxide 5e (2 g, 9.9 mmol), PhOH (1 g, 10.6 mmol), and pyridine (1.6 mL, 19.8 mmol) were heated at reflux for 5 h in EtOH (20 mL). The solvent was evaporated and the residue chromatographed (silica gel, petroleum ether 50-70 °C \rightarrow Et₂O). This was further purified by chromatography through a Lobar prepacked column, size C, LiChroprep St 60, 40–63 μ m (Merck), using petroleum ether/Et₂O 1:1. The homogeneous fractions were combined to yield 400 mg (14%) of 12: mp 97.5-99 °C; NMR (CDCl₃) δ 1.31 (s, 3 H), 1.46 (s, 3 H), 2.28 (d, 5.3, 1 H), 3.91 (dd, 7.0, 5.3, 1 H), 5.23 (d, 7.0, 1 H), 6.8 (d, 8.8, 1 H), 6.99-7.41 (m, 5 H), 7.46 (dd, 8.8, 1.7, 1 H), 7.60 (d, 1.7, 1 H). Anal. (C₁₈H₁₇NO₃) C, H, N.

trans-3,4-Dihydro-3-hydroxy-4-(2-imino-1-pyrrolidinyl)-2,2-dimethyl-2H-1-benzopyran-6-carbonitrile (15a). Compound 13^{21} (R₁ = CN; 10.6 g, 48.6 mmol), Et₃N (15 mL, 108.2 mmol), and 4-chlorobutyronitrile (8 mL, 84.2 mmol) were heated to 130 °C for 3 h in a small flask. After cooling, the melt was recrystallized from MeCN (ca. 50 mL). The precipitate was separated and dissolved in H₂O and the base precipitated by addition of NaOH. 15a: yield 5 g (36%); mp 205-206 °C; NMR $(DMSO-d_6) \delta 1.20 (s, 3 H), 1.45 (s, 3 H), 1.89 (m, 2 H), 2.50 ($ 2 H), 2.89 (m, 1 H), 3.30 (m, 1 H), 3.75 (d, 10, 1 H), 5.15 (d, 10, 1 H), 6.02 (s br, 2 H), 6.91 (d, 8.4, 1 H), 7.31 (d, 1.9, 1 H), 7.59 (dd, 8.4, 1.9, 1 H). Anal. $(C_{16}H_{19}N_3O_2)$ C, H, N

trans-4-[2-(Benzoylimino)-1-pyrrolidinyl]-3,4-dihydro-3hydroxy-2,2-dimethyl-2H-1-benzopyran-6-carbonitrile (15b). Compound 15a (200 mg, 0.7 mmol) and Et₃N (0.5 mL, 3.6 mmol) were dissolved in absolute THF (10 mL), mixed with benzoyl chloride (0.3 mL, 2.6 mmol), and stirred at room temperature for 2 h. The precipitate was collected and discarded. The mother

liquor was evaporated and the residue chromatographed on a silica gel column (Et₂O \rightarrow EtOAc). The chromatographically homogeneous fractions were combined and crystallized from Et₂O/ petroleum ether 1:1, vield 240 mg (88%). A part was recrystallized from EtOAc: mp 230-232 °C; NMR (CDCl₃) δ 1.40 (s, 3 H), 1.59 (s, 3 H), 2.08 (q, 7, 2 H), 3.27 (m, 4 H), 4.01 (s br, 1 H), 4.54 (s br, 1 H), 5.86 (s br, 1 H), 6.97 (d, 10, 1 H), 7.35 (s, 1 H), 7.40 (t, 9, 1 H), 7.50 (t, 9, 2 H), 8.09 (br, 3 H). Anal. (C₂₃H₂₃N₃O₃) C, H, N.

Journal of Medicinal Chemistry, 1990, Vol. 33, No. 2 501

4-Bromo-3,4-dihydro-2,2-dimethyl-2H-1-benzopyran-6carbonitrile (16). 3.4-Dihydro-4-hydroxy-2.2-dimethyl-2H-1benzopyran-6-carbonitrile (3e), prepared as described under 3c (46 g, 226 mmol), was dissolved in absolute PhMe (500 mL) after which PBr₃ (11.5 mL, 123 mmol) was added and the mixture stirred overnight at room temperature. The solvent was evaporated off, and the residue was dissolved in EtOAc and extracted twice with H₂O (200 mL each time). The organic phase was dried and evaporated, and the residue was filtered through a silica gel column (petroleum ether \rightarrow Et₂O): yield 43 g (71%); mp 89–92 °C; NMR (CDCl₃) δ 1.31 (s, 3 H), 1.52 (s, 3 H), 2.40 (dd, 14.1, 8.4, 1 H), 2.50 (dd, 14.1, 6.7, 1 H), 5.35 (dd, 8.4, 6.7, 1 H), 6.81 (d, 8.5, 1 H), 7.43 (dd, 8.5, 1 H), 7.86 (d, 1, 1 H). Anal. (C₁₂H₁₂BrNO) C, H, Br, N.

3.4-Dihydro-4-(1.2-dihydro-2-oxo-1-pyridyl)-2.2-dimethyl-2H-1-benzopyran-6-carbonitrile (17a). Compound 16 (10 g, 37.6 mmol) and 2-pyridone (6.3 g, 66.2 mmol) were dissolved in DMSO, and NaH (80%, 1.2 g, 40 mmol) was added. The mixture was stirred for 3 days, poured into H_2O (1 L), and extracted three times with EtOAc (500 mL each time); the organic phases were combined and dried, evaporated, and chromatographed through a silica gel column using Et₂O. The chromatographically homogeneous fractions were combined: yield 430 mg (4.1%): mp 157-159 °C; NMR (CDCl₃) δ 1.44 (s, 3 H), 1.52 (s, 3 H), 1.94 (m, 1 H), 2.32 (dd, 13.4, 6.3, 1 H), 6.20 (td, 6.7, 0.5, 1 H), 6.52 (m, 1 H), 6.67 (d, 9.1, 1 H), 6.94 (d, 8.1, 2 H), 7.11 (s br, 1 H), 7.36 (ddd, 7.7, 7.4, 1.7, 1 H), 7.46 (dd, 8.4, 0.7, 1 H). Anal. (C₁₇H₁₆N₂O₂) C, H, N.

General Procedure for Compounds 18 and 19. 4-(1,2-Dihydro-2-oxo-1-pyridyl)-2,2-dimethyl-2H-1-benzopyran-6carbonitrile (18a). Chromanol 7e (100 g, 337 mmol) and NaOH on a carrier (0.8–1.6 mm, \sim 14–25 mesh ASTM; Cat. No. 1567, E. Merck; 100 g) were heated at reflux in dioxane (3 L) in a stream of N₂ for 10 min. The solution was filtered and evaporated, and the residue was dissolved in CH₂Cl₂ (1 L) and washed twice with H_2O (500 mL each time). The organic phase was dried and evaporated, and the residue recrystallized from (Me₂CH)₂O (500 mL) to give 80 g (85%) of 18a. A part was recrystallized from Me₂CHOH: mp 144-146 °C; NMR (CDCl₃) δ 1.50 (s, 3 H), 1.65 (s, 3 H), 5.80 (s, 1 H), 6.27 (td, 6, 0.7, 1 H), 6.64 (d, 9.9, 1 H), 6.90 (d, 8.8, 1 H), 6.94 (d, 1.7, 1 H), 7.17 (dd, 6.3, 1.7, 1 H), 7.42 (dd, 9.9, 1.7, 1 H), 7.47 (td, 6.3, 1.4, 1 H). Anal. (C₁₇H₁₄N₂O₂·0.1H₂O) C, H, N.

4-(5-Acetamido-1,2-dihydro-2-oxo-1-pyridyl)-2,2-dimethyl-2H-1-benzopyran-6-carbonitrile (18g). Nitro compound 18e (1.5 g, 4.6 mmol) was hydrogenated in MeOH (25 mL) with Pd/C (5% Pd; 200 mg) until no further H₂ was absorbed. The catalyst was filtered off and the solution evaporated. The crude amine 18f was treated for 2 h with Ac₂O (3 mL, 31.7 mmol) and pyridine (3 mL, 37.2 mmol). The solution was evaporated to a residue which was chromatographed on a silica gel column (EtOAc \rightarrow MeOH). The homogeneous fractions were recrystallized from MeCN to give 400 mg (26%) of 18g: mp 255-256 °C; NMR (CDCl₃) δ 1.54 (s, 3 H), 1.60 (s, 3 H), 2.10 (s, 3 H), 5.83 (s, 1 H), 6.57 (d, 10.2, 1 H), 6.89 (d, 8.1, 1 H), 6.92 (d, 1, 1 H), 7.44 (m, 2 H), 8.17 (d, 2.4, 1 H), 9.32 (s br, 1 H). Anal. $(C_{19}H_{17}N_3O_3)$ C, H, N.

Methyl 4-(1,2-Dihydro-2-oxo-1-pyridyl)-2,2-dimethyl-2H-1-benzopyran-6-carboxylate (18j). HCl gas was passed into a boiling solution of nitrile 18a (15 g, 53.9 mmol) in MeOH (150 mL) for 4.5 h. The solution was left to stand overnight, after which time the solvent was distilled off and H_2O (150 mL) added to the residue which was then heated for 1 h on a steam bath. The water was decanted off, the residue dissolved in CH₂Cl₂ and chromatographed on a silica gel column ($CH_2Cl_2/EtOAc 1:1$) to yield 10.2 g (60%) of 18j: mp 139-141 °C; NMR (CDCl₃) δ 1.48 (s, 3 H), 1.54 (s, 3 H), 3.75 (s, 3 H), 5.71 (s, 1 H), 6.21 (td, 6.7, 0.7, 1 H),

6.62 (d, 9.5, 1 H), 6.84 (d, 7.7, 1 H), 7.15 (dd, 6.5, 1 H), 7.34 (d, 1.4, 1 H), 7.44 (dd, 7.4, 1, 1 H), 7.86 (dd, 9.5, 1.4, 1 H). Anal. ($C_{18}H_{17}NO_40.2H_2O$) C, H, N.

4-(1,2-Dihydro-2-oxo-1-pyridyl)-2,2-dimethyl-2H-1-benzopyran-6-carboxamide (18u). Nitrile 18a (7 g, 25.2 mmol) and KOH (14 g, 250 mmol) were heated at reflux for 50 min in *tert*-butyl alcohol (100 mL). After cooling, H₂O (1 L) was added, and the mixture was extracted with EtOAc. The solution was dried and evaporated, and the residue was recrystallized from EtOH to yield 7 g (92%) of 18u: mp 252-253 °C; NMR (DMSO-d₆) δ 1.48 (s, 3 H), 1.52 (s, 3 H), 6.00 (s, 1 H), 6.34 (td, 6.7, 0.5, 1 H), 6.47 (d, 8.8, 1 H), 6.89 (d, 7.8, 1 H), 7.14 (d, 1, 1 H), 7.15 (s br, 1 H), 7.54 (d, 6.9, 1 H), 7.57 (td, 7.8, 1, 1 H), 7.74 (dd, 7.8, 1, 1 H), 7.82 (s br, 1 H). Anal. (C₁₇H₁₆N₂O₃·0.3H₂O) C, H. N.

trans-3,4-Dihydro-6-(1*H*-imidazo[4,5-*c*]pyrid-2-yl)-2,2dimethyl-4-(2-oxo-1-pyrrolidinyl)-2*H*-1-benzopyran-3-ol (20b). Aldehyde 20 (R = CHO; 867 mg, 3 mmol), 3,4-diaminopyridine (371 mg, 3.4 mmol), and sodium disulfite (486 mg, 2.6 mmol) were stirred in *N*,*N*-dimethylacetamide (8 mL) for 1.5 h at 130 °C. The solution was then poured into H₂O (50 mL) and the precipitate isolated to yield 600 mg (53%) of 20b: mp >310 °C (Me₂CHOH); NMR (DMSO-d₆) δ 1.25 (s, 3 H), 1.50 (s, 3 H), 2.02 (m, 2 H), 2.50 (m, 2 H), 2.98 (m, 1 H), 3.38 (m, 1 H), 3.78 (m, 1 H), 5.12 (d, 9.5, 1 H), 5.71 (d, 5, 1 H), 7.00 (d, 9, 1 H), 7.55 (s br, 1 H), 7.81 (s, 1 H), 8.09 (d, 8.5, 1 H), 8.3 (d, 5, 1 H), 8.91 (s br, 1 H), 13.26 (s br, 1 H). Anal. (C₂₁H₂₂N₄O₃·0.1H₂O) C, H, N.

trans-3.4-Dihydro-2.2-dimethyl-4-(2-oxo-1-pyrrolidinyl)-6-thioureido-2H-1-benzopyran-3-ol (20k). Benzoyl chloride (3.2 mL, 27.5 mmol) was added dropwise to sodium thiocyanate (2.4 g, 29.6 mmol) in dry acetone (100 mL) and this mixture subsequently heated at reflux for 15 min, during which a crystalline precipitate was formed. Amine 20 ($R = NH_2$; 6.9 g, 25 mmol), dissolved in a little acetone, was added dropwise to the cooled suspension and then heated at reflux for 2 h. The solution was evaporated, the residue treated with H_2O (500 mL), and the solid material isolated and dried in the air to give 10.2 g (93%)of crude trans-6-(3-benzoylthioureido)-3,4-dihydro-2,2-dimethyl-4-(2-oxo-1-pyrrolidinyl)-2H-1-benzopyran-3-ol. 20 (R = PhCONHCSNH; 10.2 g, 23.2 mmol) was stirred in a solution of K_2CO_3 (4.8 g, 35 mmol) in $H_2O/MeOH$ (30 mL/150 mL) for 2.5 h at room temperature. The solution was evaporated to a residue which was treated with H_2O (450 mL) and the water decanted; the solid dried in the air to give 7.5 g (93%) of 20k: mp 235-237 °C (MeOH); NMR (DMSO-d₆) δ 1.18 (s, 3 H), 1.40 (s, 3 H), 1.97 (m, 2 H), 2.39 (m, 2 H), 2.99 (m, 1 H), 3.30 (m, 1 H), 3.75 (dd, 10, 5, 1 H), 4.98 (d, 10, 1 H), 5.55 (d, 5, 1 H), 6.74 (d, 8.2, 1 H), 6.89 (d, 2, 1 H), 7.09 (dd, 8.2, 2, 1 H), 7.28 (s br, 2 H), 9.45 (s, 1 H). Anal. ($C_{16}H_{21}N_3O_3S$) C, H, N, S.

trans -3,4-Dihydro-2,2-dimethyl-6-(4-methyl-2-thiazolylamino)-4-(2-oxo-1-pyrrolidinyl)-2H-1-benzopyran-3-ol (201). Compound 20k (3.3 g, 9.8 mmol) and chloroacetone (1 mL, 12.4 mmol) were heated at reflux overnight in EtOH (100 mL). The solution was evaporated to a residue which was dissolved in H₂O (50 mL) and made alkaline with 1 N NaOH; the precipitated crystals were isolated and dried in the air to yield 1.8 g (49%) of 201: mp 255 °C (EtOH); NMR (DMSO-d₆) δ 1.16 (s, 3 H), 1.40 (s, 3 H), 1.99 (m, 2 H), 2.17 (s, 3 H), 2.39 (m, 2 H), 2.95 (m, 1 H), 3.32 (m, 1 H), 3.64 (d, 9.8, 1 H), 4.96 (d, 9.8, 1 H), 5.51 (s br, 1 H), 6.34 (s, 1 H), 6.73 (d, 8.9, 1 H), 7.27 (d, 1, 1 H), 7.30 (dd, 8.9, 1, 1 H), 9.88 (s br, 1 H). Anal. (C₁₉H₂₃N₃O₃S) C, H, N, S.

trans -3,4-Dihydro-2,2-dimethyl-6-[(4-nitrobenzylidene)amino]-4-(2-oxo-1-pyrrolidinyl)-2H-1-benzopyran-3-ol (20g). Amine 20 (R = NH₂; 550 mg, 2 mmol) and 4-nitrobenzaldehyde (300 mg, 2 mmol) were heated at reflux in EtOH (20 mL) for 2 h. Compound 20g was filtered off and dried to give 750 mg (92%) of yellow crystals: mp 250-252 °C; NMR (DMSO- d_6) δ 1.18 (s, 3 H), 1.44 (s, 3 H), 1.98 (m, 2 H), 2.40 (m, 2 H), 2.95 (m, 1 H), 3.30 (m, 1 H), 3.69 (dd, 10, 5.5, 1 H), 4.99 (d, 10, 1 H), 5.59 (d, 5.5, 1 H), 6.82 (d, 8.4, 1 H), 6.87 (d, 1.6, 1 H), 7.25 (dd, 8.4, 1.6, 1 H), 8.10 (d, 8.4, 2 H), 8.30 (d, 8.4, 2 H), 8.72 (s, 1 H). Anal. (C₂₂H₂₃N₃O₆) C, H, N.

trans-3,4-Dihydro-2,2-dimethyl-4-(2-oxo-1-pyrrolidinyl)-6-(5-tetrazolyl)-2H-1-benzopyran-3-ol (20m). Nitrile 20a (2.9 g, 10.1 mmol), sodium azide (1.34 g, 20.6 mmol), and NH₄Cl (680 mg, 12.7 mmol) were heated at reflux in dry DMF (5 mL) under N₂ for 24 h. After cooling, H₂O (100 mL) was added, and the crystals were separated to yield 2.5 g (75%) of **20m**: mp 296–297 °C; NMR (DMSO- d_6) δ 1.21 (s, 3 H), 1.45 (s, 3 H), 1.97 (m, 2 H), 2.42 (m, 2 H), 2.90 (m, 1 H), 3.30 (m, 1 H), 3.71 (dd, 9.2, 5.2, 1 H), 5.04 (d, 9.2, 1 H), 5.69 (d, 5.2, 1 H), 6.98 (d, 8.4, 1 H), 7.55 (d, 1.2, 1 H), 7.81 (dd, 8.4, 1.2, 1 H), 16.30 (s br, 1 H). Anal. (C₁₆H₁₉N₅O₃) C, H, N.

Methyl trans -3,4-Dihydro-3-hydroxy-2,2-dimethyl-4-(2oxo-1-pyrrolidinyl)-2H-1-benzopyran-6-carboximidate Dihydrochloride (20n). Compound 20a (20 g, 69.8 mmol) was suspended in MeOH (800 mL). This was saturated with HCl with ice cooling, a clear solution eventually forming. After standing overnight, the solution was evaporated down to a volume of 50 mL and cooled; the precipitated crystals were collected and washed with Me₂CHOH and with Et₂O to yield 22 g (80%) of 20n: mp 164-166 °C; NMR (DMSO-d₆) δ 1.19 (s, 3 H), 1.45 (s, 3 H), 1.99 (m, 2 H), 2.41 (m, 2 H), 2.89 (m, 1 H), 3.07 (s, 3 H), 3.34 (m, 1 H), 3.69 (d, 10.2, 1 H), 5.00 (d, 10.2, 1 H), 6.80 (d, 7.8, 1 H), 7.44 (d, 1.4, 1 H), 7.72 (dd, 7.8, 1.4, 1 H), 8.30 (s br). Anal. (C₁₇-H₂₂N₂O₄-2HCl) C, H, Cl, N.

trans-3,4-Dihydro-6-(2-imidazolin-2-yl)-2,2-dimethyl-4-(2-oxo-1-pyrrolidinyl)-2H-1-benzopyran-3-ol (200). Imino ether 20n (1.7 g, 4.3 mmol) and ethylenediamine (1.2 g, 20 mmol) were added to MeOH (20 mL), the temperature rising slightly, and the mixture was left to stand at room temperature for 2 h. The solution was evaporated to a residue which was crystallized from H₂O to give 1.6 g (98%) of 200: mp 202-206 °C (Me₂CHOH); NMR (DMSO-d₆) δ 1.18 (s, 3 H), 1.45 (s, 3 H), 1.95 (m, 2 H), 2.39 (m, 2 H), 2.89 (m, 1 H), 3.30 (m, 1 H), 3.60 (s, 4 H), 3.69 (d, 10.6, 1 H), 5.00 (d, 10.6, 1 H), 5.69 (s br), 6.82 (d, 8.5, 1 H), 7.37 (d, 1, 1 H), 7.65 (dd, 8.5, 1, 1 H). Anal. C₁₈H₂₃N₃O₃) C, H, N.

trans-3-(Formyloxy)-3,4-dihydro-4-(1,2-dihydro-2-oxo-1pyridyl)-2,2-dimethyl-2H-1-benzopyran-6-carbonitrile (21a). Formic acid (11.7 mL, 310 mmol) and Ac₂O (3.3 mL, 35 mmol) were mixed with ice cooling, after which 7e (2 g, 6.7 mmol) was added and the reaction mixture heated to 42 °C for 3 h. The solution was evaporated and the residue chromatographed on a silica gel column (CH₂Cl₂/EtOAc 1:1) to yield 1.08 g (49%) of 21a: mp 203.5-204 °C; NMR (DMSO- d_6 , 390 K) δ 1.36 (s, 3 H), 1.45 (s, 3 H), 5.72 (d, 9.6, 1 H), 5.92 (d br, 9.5, 1 H), 6.19 (td, 6.8, 1.5, 1 H), 6.37 (dt, 9.17, 2.2, 1 H), 7.02 (d, 8.6, 1 H), 7.06 (d, 2, 1 H), 7.37 (td, 9.2, 6.5, 2, 1 H), 7.45 (dd, 6.9, 2, 1 H), 7.57 (dd, 8.5, 2.1, 1 H), 8.14 (s, 1 H). Anal. (C₁₈H₁₆N₂O₄·0.1H₂O) C, H, N.

trans -3,4-Epoxy-3,4-dihydro-4-(1,2-dihydro-2-oxo-1pyridyl)-2,2-dimethyl-2H-1-benzopyran-6-carbonitrile (22a). Chromene 18a (12.4 g, 44.6 mmol) was dissolved in CH₂Cl₂ (93 mL); a solution of 3-chloroperbenzoic acid (13.6 g, 79 mmol) in CH₂Cl₂ (155 mL) was added dropwise. The reaction mixture was stirred at room temperature for 3 days and the precipitate removed. The mother liquor was extracted with dilute NaOH, and the organic phase dried. The solvent was evaporated and the residue chromatographed through a silica gel column. The chromatographically homogeneous fractions were combined to yield 7.1 g (54%) of 22a: mp 128-131 °C (Me₂CH)₂O/Et₂O 1:1); NMR (CDCl₃) δ 1.50 (s, 3 H), 1.55 (s, 3 H), 3.69 (s, 1 H), 6.35 (td, 6.7, 1, 1 H), 6.58 (dd, 8.8, 1, 1 H), 6.94 (d, 8.1, 1, H), 7.06 (d, 2.1, 1 H), 7.42-7.57 (m, 3 H). Anal. (C₁₇H₁₄N₂O₃·0.1H₂O) C, H, N.

3,4-Dihydro-4-(1,2-dihydro-2-oxo-1-pyridyl)-2,2-dimethyl-3-oxo-2H-1-benzopyran-6-carbonitrile (23a). HCl gas was passed into a boiling solution of epoxide 22a (17 g, 57.8 mmol) in absolute dioxane (150 mL) for 45 min. After cooling, the solution was diluted with Et₂O (100 mL), 23a precipitating as crystals: yield 15 g (88%); mp 175–178 °C (Me₂CHOH); NMR data of the keto species (CDCl₃) δ 1.54 (s, 3 H), 1.61 (s, 3 H), 6.10 (s br, 1 H), 6.35 (td, 6.7, 0.7, 1 H), 6.65 (d, 8.8, 1 H), 7.02–7.18 (m, 3 H), 7.49 (td, 7.7, 1.4, 1 H), 7.58 (dd, 8.1, 1, 1 H). Anal. (C₁₇H₁₄N₂O₃·0.1H₂O) C, H, N.

3,4-Dihydro-2,2-dimethyl-4-oxo-3-(2-pyridyloxy)-2H-1benzopyran-6-carbonitrile (24). Epoxide 22a (500 mg, 1.7 mmol), liquid NH₃ (1 mL), and EtOH (10 mL) were heated at 130 °C in a bomb tube for 15 min. The tube was then opened and heated for another 15 min at 130 °C to evaporate the volatile components. The residue was recrystallized from a small quantity of $(Me_2CH)_2O$ to give 300 mg (60%) of 24: mp 110–112 °C; NMR $(CDCl_3 + D_2O) \delta$ 1.48 (s, 3 H), 1.62 (s, 3 H), 6.23 (s, 1 H), 6.84–7.0 (m, 2 H), 7.08 (d, 8.1, 1 H), 7.49–7.79 (m, 2 H), 8.09 (dd, 5.3, 1.4, 1 H), 8.15 (d, 2.1, 1 H). Anal. ($C_{17}H_{14}N_2O_3$) C, H, N.

cis-3,4-Dihydro-4-(1,2-dihydro-2-oxo-1-pyridyl)-3hydroxy-2,2-dimethyl-2H-1-benzopyran-6-carbonitrile (7ab). Ketone 23a (3 g, 10.1 mmol) was dissolved in MeOH (50 mL) and NaBH₄ (750 mg, 19.8 mmol) was added in portions. After 1 h the solvent was evaporated off; the residue was dissolved in H₂O (100 mL) and the solution extracted with CH_2Cl_2 (200 mL). The organic phase was dried and evaporated to a residue in a Rotavapor; the residue was recrystallized from a little MeOH: yield 2.1 g (70%) 7e, mp 245-246 °C. The mother liquor was chromatographed through a LiChrosorb Si 60 steel column (E. Merck, Cat. No. 9387; CH₂Cl₂/MeOH 95:5), and the homogeneous fractions of 7ab were combined: yield 130 mg (4.3%); mp 210-212 °C (Et₂O); NMR (CDCl₃) δ 1.44 (s, 3 H), 1.56 (s, 3 H), 2.87 (d br, 5.6, 1 H), 3.95 (dd, 5.6, 3.5, 1 H), 6.17 (t, 6.3, 1 H), 6.59 (m, 2 H), 7.00 (d, 7.8, 1 H), 7.13 (s br, 1 H), 7.19 (dd, 7, 0.7, 1 H), 7.39 (ddd, 8.8, 6.7, 1.7, 1 H), 7.50 (dd, 8.8, 1.7, 1 H). Anal. $(C_{17}H_{16}N_2O_3 - C_{17}H_{16}N_2O_3 - C_{17}H_{17}H_{17}N_2O_3 - C_{17}H_{17}H_{17}N_2O_3 - C_{17}H_{1$ 0.1H₂O) C, H, N.

4-(1,2-Dihydro-2-oxo-1-pyridyl)-3-methoxy-2,2-dimethyl-2H-1-benzopyran-6-carbonitrile (25c). Ketone 23a (600 mg, 2 mmol), dimethyl sulfate (0.2 mL, 2.1 mmol), K_2CO_3 (600 mg, 4.3 mmol), and Me₂CO (20 mL) were stirred overnight at room temperature. The precipitate was removed and the mother liquor evaporated. The residue was mixed with a little Et₂O and crystallized to yield 400 mg (60%) of 25c: mp 186–188 °C; NMR (CDCl₃) δ 1.54 (s, 3 H), 1.59 (s, 3 H), 3.63 (s, 3 H), 6.34 (td, 7.1, 0.9, 1 H), 6.71 (d, 9.1, 1 H), 6.76 (d, 1.1, 1 H), 6.87 (d, 7.6, 1 H), 7.16 (dd, 7.1, 1.4, 1 H), 7.35 (dd, 8.1, 1.7, 1 H), 7.51 (ddd, 8.8, 6.7, 1.7, 1 H). Anal. (C₁₈H₁₆N₂O₃·0.2H₂O) C, H, N.

trans-3,4-Dibromo-3,4-dihydro-2,2-dimethyl-2H-1-benzopyran-6-carbonitrile (26). Br₂ (1.8 mL, 35.1 mmol) dissolved in CH₂Cl₂ (20 mL) was added dropwise to a solution of chromene 4e (6.7 g, 36.2 mmol) in CH₂Cl₂ (20 mL) at 10 °C within 15 min. The solvent was evaporated and the residue crystallized from Et₂O to yield 9.1 g (73%) of 26: mp 111–113 °C; NMR (CDCl₃) δ 1.47 (s, 3 H), 1.69 (s, 3 H), 4.45 (d, 7.2, 1 H), 5.48 (d, 7.2, 1 H), 6.88 (d, 7.9, 1 H), 7.47 (dd, 7.9, 1.4, 1 H), 7.83 (d, 1.4, 1 H). Anal. (C₁₂H₁₁Br₂NO-0.1H₂O) C, H, Br, N.

4-Chloro-2,2-dimethyl-2H-1-ben zopyran-6-carbonitrile (27). Chromanone 2e (2.8 g, 13.9 mmol) and PCl₅ (3.1 g, 14.9 mmol) were heated at reflux in a mixture of absolute benzene (25 mL) and CS₂ (5 mL) for 20 h. The solvents were evaporated, and the residue was chromatographed on a silica gel column (CH₂Cl₂). The nonpolar main product was crystallized from *n*-hexane to yield 900 mg (29%) of 27: mp 38-40 °C; NMR (CDCl₃) δ 1.50 (s, 6 H), 5.84 (s, 1 H), 6.84 (d, 7.7, 1 H), 7.47 (dd, 7.7, 1.2, 1 H), 7.70 (d, 1.2, 1 H). Anal. (C₁₂H₁₀ClNO·0.1H₂O) C, H, Cl, N.

3-(1,2-Dihydro-2-oxo-1-pyridyl)-2,2-dimethyl-2H-1-benzopyran-6-carbonitrile (28). Dibromide 26 (10.5 g, 30.2 mmol), 2-pyridone (8.7 g, 91.5 mmol), and K_2CO_3 (12.3 g, 89 mmol) in DMF (150 mL) were heated at 130 °C for 1 h. After cooling, the precipitate was filtered off and discarded. The mother liquor was mixed with H_2O (500 mL) and extracted with EtOAc. The organic phase was evaporated to a residue which was chromatographed on a silica gel column (Et₂O \rightarrow EtOAc) to give 1.46 g (17%) of 28: mp 116-118 °C; NMR (CDCl₃) δ 1.55 (s, 6 H), 6.20 (td, 6.7, 1 H), 6.49 (s, 1 H), 6.58 (d, 9.9, 1 H), 6.97 (d, 7.7, 1 H), 7.18 (dd, 6.7, 1.4, 1 H), 7.33-7.46 (m, 2 H), 7.50 (dd, 7.7, 1.4, 1 H). Anal. (C₁₇H₁₄N₂O₂·0.7H₂O) C, H, N.

Antihypertensive Studies in Conscious Spontaneously Hypertensive Rats. Compounds were tested for antihypertensive action in conscious spontaneously hypertensive male rats (280–330 g; blood pressure > 180 mmHg; origin: Okamoto-strain). Arterial pressure was recorded directly via an aortic catheter to determine the potency of substance (mean arterial blood pressure) in unrestrained animals and indirectly (to evaluate the duration of action of the substance) by means of a plethysmographic method (measurement of the systolic blood pressure) in restrained animals.

For direct recording of arterial blood pressure an HSE setup (Statham pressure transducer, Watanabe recorder, HSE oscilloscope) was used while IITC equipment (tail cuff, photoelectric sensor) was used for the indirect measurement. With the direct method, the blood pressure was recorded continuously over a period from 1 h before to 3.5 h after administration of the substance; to assess the effects of the substance, the mean of the maximum individual changes in the 3.5-h period after administration was used. With the indirect method, measurements were made prior to and 2 and 20 h postadministration of the compound. For each compound 1 mg/kg was administered orally as a screening dose; two to four additional doses of the compounds that proved active at 1 mg/kg in reducing blood pressure were tested, and an ED_{30} (= dose in μ g/kg that reduces blood pressure by 30 mmHg) was calculated from a linear regression of effect vs log dose. The substances were suspended in 5% gum arabic and administered orally by gavage.

Acknowledgment. We wish to extend our thanks to Dr. Volker Eiermann and Helmut Müller for the measurement and interpretation of NMR and mass spectra. For their skillful experimental work we would like to thank Christiane Dinkel, Günther Kritzinger, Heinrich Kübler, Gabriele Pöschl, Horst Schiefer, Sigrid Veith, and Sylvia Wild. We also thank Marion Gerbig for preparing and typing the manuscript.

Synthesis and Antiinflammatory Activity of *cis*- and *trans*-6,6a,7,8,9,10,10a,11-Octahydro-11-oxodibenzo[*b*,*e*]thiepinacetic and -oxepinacetic Acids

Mikio Kurokawa,* Hitoshi Uno, Hideo Nakamura, Fuminori Sato, and Shunsuke Naruto

Research Laboratories, Dainippon Pharmaceutical Co., Ltd., Enoki 33-94, Suita, Osaka 564, Japan. Received March 13, 1989

A series of *cis*- and *trans*-6,6a,7,8,9,10,10a,11-octahydro-11-oxodibenzo[*b,e*]thiepinacetic acids (6-9) and -oxepinacetic acids (10-13) were prepared and their antiinflammatory activity was examined in the rat carrageenan hind paw edema test. The antiinflammatory activity of these compounds depended on their stereochemical feature (C6a, C10a, and C2'). The 6a,10a-trans compounds exhibited considerable antiinflammatory activity, whereas the 6a,10a-cis compounds were inactive. Among the trans compounds, 6,6a,7,8,9,10,10a,11-octahydro-11-oxodibenzo[*b,e*]thiepin-3-propionic acid (9a) and its oxepin analogue (13a) showed an antiinflammatory activity superior to that of indomethacin. The phenethyl ester (25) of 9a showed potent antiinflammatory activity, and its safety index (UD_{50}/ED_{50}) was over 14 times higher than that of indomethacin. The phenethyl ester (25) is the most favorable compound with high antiinflammatory activity and little ulcerogenicity.

Vane et al.¹ found that nonsteroidal antiinflammatory drugs (NSAIDs) such as aspirin and indomethacin had an inhibitory activity on prostaglandin biosynthesis and this activity was correlative with their antiinflammatory activity. Shen² has proposed an interesting hypothesis concerning the receptor-site model for NSAIDs.

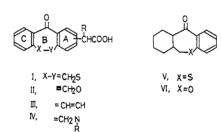

Many tricyclic arylacetic acids having a 6–7–6-membered ring have recently been reported as potent antiinflammatory agents, for example, dibenzothiepin- (I),³ dibenzoxepin- (II),⁴ dibenzotroponone- (III),⁵ and dibenzazepinacetic acids (IV).⁶ In each of these, two six-membered rings consist of benzene rings.

Since it is of interest for us to examine the effect of partial saturation of the 6-7-6-ring system on the antiinflammatory properties of this class of NSAIDs, we had studied 6,6a,7,8,9,10,10a,11-octahydro-11-oxodibenzo[b,-e]thiepin (V) and -oxepin (VI) derivatives⁷ (Chart I). As an extension of these works, we now wish to report the synthesis and preliminary pharmacological evaluation of a number of octahydro-11-oxodibenzo[b,e]thiepinacetic acids (6-9) and their oxepin analogues (10-13). Some of them were highly active in animal models as NSAIDs. On the basis of these data, compound 9a appears to offer

Scheme I

several advantages over indomethacin.

In the clinical use of NSAIDs, gastrointestinal lesions have been the most troublesome problem. In order to lessen this side effect, **9a** was led to its esters and amides. Among the synthesized compounds, the phenethyl ester (**25**) of **9a** showed a potent antiinflammatory activity and weak irritative effect on gastric mucosa, and hence was selected for further investigation.

Chemistry. The *cis*- and *trans*-6,6a,7,8,9,10,10a,11octahydro-11-oxodibenzo[b,e]thiepinacetic acids (6-9) and -oxepinacetic acids (10-13) were synthesized by the two
