Reactions of Carbohydrate α-Keto Toluene-p-sulphonates. Reaction of Methyl 4,6-O-Benzylidene-2-O-toluene-p-sulphonyl-α-D-ribo-hexopyranosid-3-ulose with Triethylamine-Methanol

By A. DMYTRACZENKO, W. A. SZAREK,* and J. K. N. JONES

(Department of Chemistry, Queen's University, Kingston, Ontario, Canada)

Summary. Reaction of methyl 4,6-O-benzylidene-2-O-toluene-p-sulphonyl-α-D-ribo-hexopyranosid-3-ulose (I) with triethylamine-methanol yields methyl 2,3-anhydro-4,6-O-benzylidene-3-methoxy-α-D-allopyranoside (II), methyl 4,6-O-benzylidene-α-D-ribo-hexopyranosid-3-ulose dimethyl acetal (III; R=H), and a derivative of 3-hydroxy-2-(hydroxymethyl)-4H-pyran-4-one (IV).

The importance of sulphonic esters of carbohydrates as substrates for the preparation of a wide variety of sugars by nucleophilic displacement reactions has been firmly established.¹ The reactivity of a sulphonate group depends

critically upon the position of the group and upon the stereochemistry and conformation of the carbohydrate molecule. 1,2 If a sulphonate is situated at C-2 of a pyranoside, then nucleophilic displacement with charged nucleophiles does not normally occur. Attempts have been made to achieve nucleophilic displacements of a 2-sulphonate by using a more activated sulphonate as a leaving group as in methyl 4,6-O-benzylidene-2-O-toluene-p-sulphonyl- α -ribohexopyranosid-3-ulose (I); it is known that a carbonyl group adjacent to the reaction centre assists bimolecular substitution. Here we report the unusual compounds obtained from the reaction of the α -keto toluene-p-sulphonate 3,4 (I) with triethylamine-methanol.

SCHEME 1

A solution of compound (I) (2.5 g) in triethylamine (1.6 ml) and methanol (65 ml) was heated at reflux temperature; after 50 min t.l.c.† revealed that all of the starting material $(R_F 0.65)$ had been consumed, and showed the presence of two new components, having $R_{\rm F}$ values of 0.61 and ca. 0.29 (elongated spot), in addition to material which did not migrate. The faster-moving component crystallized from chloroform-ethanol gave pure methyl 2,3-anhydro-4,6-O-benzylidene-3-methoxy-α-D-allopyranoside (II), m.p. 187-190°, $[\alpha]_D + 108^\circ$ (c 1·32); n.m.r. data: $\tau 2\cdot 4-2\cdot 7$ (5H) multiplet, Ph), 4·40 (1H singlet, benzylidene-methine H), 5·13 (1H doublet, $J_{1,2}$ 3 Hz, 1-H), 6·30 (1H doublet, 2-H), 6.55 and 6.60 (3H singlets, 1-OMe and 3-OMe); no OH or C=O absorptions in i.r. spectrum (Nujol mull). The D-allo-configuration was assigned to (II) on the basis of the magnitude of $J_{1,2}$; it has been shown⁵ in several 2,3anhydroglycopyranosides that, when the 2,3-epoxy-group and the anomeric alkoxy-group were trans, $J_{1,2}$ was ca. 0, whereas when the groups were in the cis-arrangement, $J_{1,2}$ was 2.5-4.5 Hz. The formulation of (II) as an α -methoxyepoxide was substantiated by its conversion, on treatment with lithium aluminium hydride in tetrahydrofuran, into methyl 4,6-O-benzylidene-2-deoxy-α-D-vibo-hexopyranoside, 6 m.p. 128-130°, $[\alpha]_D + 138^\circ$ (c 1·16). A possible mechanism for the formation of (II) and (I) involves initial epimerization to give the axial toluene-p-sulphonate, followed by equatorial attack by methanol on the carbonyl carbon, and finally internal displacement of the toluene-bsulphonyloxy-group by the carbonyl oxygen.

The slower-moving component was isolated by evaporation of the filtrate, remaining after separation of com-

pound (II), to give a residue, which crystallized from chloroform-petroleum, yield 0.563 g (38%). Recrystallization afforded an analytically pure sample of the deriva-

tive of 3-hydroxy-2-(hydroxymethyl)-4H-pyran-4-one (IV), m.p. 115–117°; n.m.r. data [(CD₃)₂SO]: τ 1·90, 3·62 (1H doublets, $J_{5,6}$ 5·6 Hz, 5-H and 6-H), 2·60 (5H, Ph), 4·08 (1H singlet, acetal-methane H), 5·45 (2H singlet, CH₂), and 6·70 (3H singlet, OMe); ν_{max} (Nujol mull) 1658 and

† T.l.c. was performed with Silica Gel G as the adsorbent and 2:1 (v/v) ethyl acetate-petroleum (b.p. $60-80^{\circ}$) as the developing solvent. Optical rotations were measured at $23\pm2^{\circ}$ in chloroform. N.m.r. data, obtained at 60 MHz, refer to CDCl₃ solutions, unless otherwise stated. All new compounds gave satisfactory elemental analyses.

1640 cm⁻¹ ($\cdot C = C \cdot CO \cdot C = C \cdot$); positive ferric chloride test. The structure assigned to (IV) was confirmed by the chemical transformations shown in Scheme 2. Thus, acidcatalysed hydrolysis of (IV) gave 3-hydroxy-2-(hydroxymethyl)-4H-pyran-4-one (V), which was converted into maltol (VII) essentially by the procedure described by Stodola, 7 namely, by treatment of (V) with thionyl chloride to give the chloro-derivative (VI), followed by reduction of (VI) with zinc dust and acetic acid. A possible rationalization for the formation of the γ -pyrone (IV) from the α-keto toluene-p-sulphonate (I) on treatment with triethylamine-methanol is shown in Scheme 3.‡

In a separate experiment, a solution of compound (I) in triethylamine-methanol was heated at reflux temperature for a period longer than 50 min; a third new component $(R_{\rm F} \ 0.54)$ was formed, which was shown to be methyl 4,6-O-benzylidene-α-D-ribo-hexopyranosid-3-ulose dimethyl acetal (III; R=H), a maximum yield of which was obtained in 48 h, at which time the presence of the α-methoxyepoxide (II) could no longer be detected by t.l.c. Compound (III; R=H) was isolated by column chromatography as a syrup, yield 21%, $[\alpha]_D + 112^\circ$ (c 1·24); n.m.r. data: au 7.20 (1H doublet, J 12 Hz, disappeared on deuteriation, OH), 5·35 (1H doublet, $J_{1,2}$ 4 Hz, 1-H), 6·38, 6·45, and 6.55 (3H singlets, 1-OMe and two 3-OMe's); v_{max} (film) 3500 cm⁻¹ (OH). The magnitude of the splitting observed for the 1-H signal in the n.m.r. spectrum is consistent with values reported⁸ for an equatorial-axial arrangement of 1-H and 2-H, respectively, in methyl 4,6-O-benzylidene-α-D-hexopyranosides. Compound (III; R=H) afforded a crystalline toluene-p-sulphonate (III; R=Ts), m.p. 136-138° (decomp.), $[\alpha]_D + 3.51^\circ$ (c 1.23).

Full details of these and other reactions of carbohydrate α -keto toluene-p-sulphonates will be published later.
