

Synthesis of Novel 4,6-Diazaspiro[2.3]hex-1-en-5-ones by the Reaction
of Diphenylcyclopropenone Oxime with Isocyanates[#]

Diphenylcyclopropenone oxime hydrochloride (3) was prepared in an 83% yield from diphenylcyclopropenone and hydroxylamine hydrochloride in methanol. The salt 3 reacted with alkyl and aryl isocyanates in the presence of triethylamine to yield 1:2 addition products diazaspiro[2.3]hexenones in good yields.

Physical and chemical properties of cyclopropenones, cyclopropenium ions, and triafulvenes have been highly interested and currently investigated¹⁾ as microcyclic aromatics. In the continuation of our studies on the chemistry of cyclopropenium salts possessing heteroatom substituents we have found an easy route for the preparation of diphenylcyclopropenone oxime (4),²⁾ the chemical nature of which has not been explored. Below we describe the preparation and reaction of 4 with isocyanates to yield novel 4,6-diazaspiro[2.3]hexenes.

A solution of diphenylcyclopropenone (1) [20 mmol] and hydroxylamine hydrochloride (2) [60 mmol] in methanol (25 cm³) was allowed standing at room temperature for a day. The precipitated salt 1-hydroxyamino-2,3-diphenylcyclopropenium chloride (3) was obtained in an 83% yield by filtration. The salt 3 gave satisfactory spectroscopic data³⁾ and yielded yellow needles of free 4⁴⁾ on treating with aqueous sodium hydrogencarbonate or triethylamine in benzene.

An equimolar reaction of 3 with methyl isocyanate (5a) in the presence of triethylamine gave 4-methyl-6-methylcarbamoyloxy-1,2-diphenyl-4,6-diazaspiro[2.3]-hex-1-en-5-one (6a) in a 40% yield. The use of twice excess moles of 5a at room temperature for a day gave 6a in a 70% yield. The structure of 6a was assigned from its ¹H- and ¹³C-NMR, and mass spectroscopic studies.⁵⁾ Similar treatment of 3 with two moles of isocyanates such as propyl, t-butyl, phenyl, 3-methylphenyl, and 4-chlorophenyl isocyanates (5b-f) yielded in 63, 69, 71, 67, and 48% yield respectively. No 1:1 addition product was isolated in our hands. To our knowledge no spiro derivatives like these have been reported, though it has been shown that some C=N derivatives react with isocyanates to afford the 1:1 cycloaddition products, 1,3-diazetidines.⁶⁾

It is well known that aldoximes and ketoximes react with isocyanates to afford carbamates.^{6b)} Although the isolation of (carbamoyloxy)iminocyclopropane

[#]This paper is dedicated to the late Professor Ryoza Goto, Kyoto University.

(7), a 1:1 addition product, failed, the intermediacy of 7 was clear from the final product 6. The reaction of highly polarized 7 with 5 would be faster than that of 4 with 5.
