## 1. INTRODUCTION

Tetrahydrofurans are among the most significant classes of heterocycle in natural products, and consequently a wide range of methods for their synthesis has been developed. ${ }^{1}$ In designing synthetic routes to tetrahydrofurans the intuitive disconnection of a carbon-oxygen bond in the ring implies the combination of a nucleophilic oxygen atom with an electrophilic carbon site. Work by Normant and co-workers in the mid-1980 ${ }^{2}$ showed that tetrahydrofurans could be made using 5-endo-trig ${ }^{3}$ reactions of vinylic sulfones possessing distal hydroxyl groups. Treatment of $t$-butylsulfones 1 with base caused efficient 5 -endo-trig cyclisation to give tetrahydrofurans 2. We became interested in extending this chemistry to more highly substituted substrates 3. We were keen to assess the extent of asymmetric induction to the newly-formed stereocentre from that present in 3, particularly as a function of vinylic sulfone double bond geometry. This paper reports our findings in full. ${ }^{4}$

## Synthesis of cyclisation substrates 3

Crucial to the viability of our planned study were ready sources of $E-$ and $Z-3$, and we were able to apply the methodology of Julia to the synthesis of these substrates. Reaction of the lithio-anion of (phenylsulfonyl)methane in THF-DMPU with 2 -substituted oxiranes, followed by quenching of the reactions

[^0]with $t$-butylchlorodimethylsilane gave the expected silyl ethers 4 in good yield. For some of the larger-scale reactions, it was found more convenient to carry out the protection as a discrete step. Our plan for the preparation of $E-3$ was based on the known ${ }^{5}$ E1cB elimination of $\beta$-acyloxysulfones. Two sequences were deployed: in the first, reaction of deprotonated 4 with aldehydes followed by acylation in situ with benzoyl chloride gave the adducts 5 as four-component diastereomeric mixtures; the alternative method involved low-temperature proton quench of the reaction with aldehydes, isolation and benzoylation in a separate operation. Treatment with potassium tert-butoxide followed by desilylation gave predominantly $E-3$; the minor, $Z$-isomers were separable by chromatography on silica gel. The synthesis of $Z-3$ required a change in tactics such as to accommodate the E2-type elimination from substrates analogous to 5 but with only the threo- stereochemistry. ${ }^{6}$ Since 5, and therefore the precursor alcohols 6 were formed non-selectively it was necessary to oxidise 6 to the $\beta$ ketosulfones 7, and then to effect selective reduction prior to functionalisation of the threo-enriched secondary alcohols 6 in such a way as to activate them towards E2 rather than E1cB reaction. In the event, oxidation with PDC followed by reduction with $\mathrm{NaBH}_{4}-\mathrm{CeCl}_{3}{ }^{7}$ gave threo- 6 in good overall yields. Subsequent tosylation, followed by elimination using $\mathrm{NaOEt}-\mathrm{EtOH}$ gave mixtures containing in most cases predominantly the Z isomers. ${ }^{5}$ Desilylation gave $Z$-enriched mixtures of 3 which were separated by HPLC (Scheme 2, Table 1).

## Cyclisation reactions

The conditions of Normant and Knochel ${ }^{2}$ were found not to be effective for cyclisation of substrates 3. It was found instead that treatment of 3 with one equivalent of potassium $t$-butoxide in THF containing 5 or 10 equivalents of $t$-butanol led to smooth, and usually rapid cyclisation to give tetrahydrofurans 8 . Only two of the four possible diastereomers were formed, in which the $\mathrm{R}^{2}$ and phenylsulfonyl groups were mutually anti-. Structural assignments followed from n.O.e. measurements. ${ }^{8}$ for example, for syn-8f there was a $7 \%$ enhancement of $\mathrm{H}-2$ on irradiation of $\mathrm{H}-5$; anti-8f showed a $0 \%$ enhancement. Also, syn-8 with $\mathrm{R}^{2}=\mathrm{Me}$ frequently gave large enhancements of $\mathrm{H}-3$ upon irradiation of the $\mathrm{C}-2 \mathrm{Me}$ signal (syn-8f: $9.5 \%$; syn-8g: $10 \%$; syn-8k: 9\%). Anti-8 typically showed n.O.e. effects demonstrating the proximity of H-3 and H-5 signal (anti$\mathbf{8 f}$ : $2.7 \%$; anti-8g: $2 \%$; anti-8k: $2.5 \%$ ), indicating a syn-relationship of the C-3 phenylsulfonyl group and the C5 substituent, and by implication an anti-relationship of the sulfonyl group with the group at $\mathrm{C}-2$. The cyclisation reactions of $E$ - and $Z-3$ are summarised in Scheme 3 and Table 2.

Table 2 Cyclisation of substrates 3
Several trends emerged from the results collected in Table 2. Firstly, it was immediately apparent that cyclisation of most of the $E$-substrates was only weakly selective for the syn-products 8 (entries a, e-k); in general, substrates having $\mathrm{CH}_{3}$ groups on the vinylic sulfone $\beta$-position showed the lowest selectivity. Nevertheless, a minority of substrates showed good levels of syn-selectivity (entries m, o); a common feature of these substrates was the presence of branching in $\mathrm{R}^{2}$ adjacent to the vinylic sulfone double bond. Crucial to the success of these stereoselective transformations was the presence of increased amounts of $t$-butanol (Scheme 3, conditions B); under conditions A the similarly branched substrate $E-\mathbf{3 b}$ gave none of the expected
tetrahydrofuran, instead undergoing rapid isomerisation to provide the allylic sulfone 9 in near-quantitative yield. An analogous transformation, giving 10 occurred upon exposure of the $\gamma$-oxygenated substrate $E$-3c to conditions A. The second trend to emerge was the instability relative to the alkyl-substituted analogues of substrates $E-\mathbf{3}$ possessing $\beta$-aryl substitution on the vinylic sulfone. Thus, compound $E-3 \mathbf{d}$ gave only small amounts of syn-8d on base treatment, albeit completely selectively; the major product isolated from this reaction was vinylic sulfone 11 ( $\mathrm{Ar}=\mathrm{Ph}$ ). Presumably compound $11(\mathrm{Ar}=\mathrm{Ph})$ is the product of fragmentation of the conjugate base of $E-3 \mathrm{~d}$, with the driving-force provided by delocalisation into the phenyl ring of negative charge in

 the conjugate base of $\mathbf{1 1}(\mathrm{Ar}=\mathrm{Ph})$ formed on covalent bond scission (Scheme 4). Support for this hypothesis was provided by the observed attenuation of the fragmentation pathway in the reaction of the more electron-rich
$E-3 d=$

## Scheme 4

( $\mathrm{Ar}=\mathrm{Ph}$ to give 8 with high anti-selectivity (entries $b$, $m$ and 0 ) As the steric demand observed (entry $\mathbf{n}$ ) although the selectivity is lower than for the isomeric $E$ - substrate. For $\mathbf{3 i}$, possessing a methyl substituent on the vinylic sulfone, cyclisation selectivities were identical for the two geometric isomers; indeed, exposure of $Z-3 i$ to base followed immediately by quenching with acid gave a crude product containing mostly $E$-3i. Therefore it may be deduced that whilst more hindered $Z$ - 3 undergo highly selective 5 -endo-trig cyclisations to give mostly anti-8, less hindered Z- substrates enter into competing direct cyclisation and isomerisation-cyclisation processes, with the latter dominating when $\mathrm{R}^{2}$ is methyl. The difference in the behaviour of $E$ - and $Z-\mathbf{3 b}$ under the more basic conditions A is striking, and may point towards an internal proton transfer mechanism for isomerisation of the former to the allylic compound. All of the product ratios resulted from kinetic preferences in irreversible transformations; exposure to the cyclisation conditions of isolated, single isomers of products $\mathbf{8}$ caused only slow decomposition, with no regeneration of isomeric $\mathbf{8}$ or $\mathbf{3}$.

We were prompted to consider models which might explain the considerable differences in selectivities of cyclisation reactions of $E$ - and $Z-3$. We had reasoned previously ${ }^{4 i)}$ that reactions of $E-3$ might be unselective on account of potentially destabilising interactions in the reactive conformations/transition-states $\mathbf{A}$ and $\mathbf{B}$ leading to both syn- and anti-8. This model led us to believe that reactions of $Z-3$ would be selective for anti-8, since there was no longer a destabilising interaction in the corresponding reactive conformation $\mathbf{C}$. Whilst this prediction was borne out by experiment, the model does not satisfactorily explain why E-3 having more sterically demanding $\mathrm{R}^{2}$ undergo more syn-selective reactions than the less encumbered analogues (Scheme 5).

## Derivatisation reactions of 8

The final part of our study addressed some derivatisation reactions of 8. Of particular interest was the stability of the conjugate bases of 8 resulting from deprotonation $\alpha-$ to the C-3 phenylsulfonyl group, since the earlier workers ${ }^{2}$ had reported that related tetrahydrofurans underwent ring-opening in the presence of $n$ butyllithium at low temperature. Because of this reported lability, we opted to look at the reaction of the lithioanion of $\operatorname{syn}-8 \mathrm{a}\left(\mathrm{R}^{1}=\mathrm{R}^{2}=\mathrm{Me}\right.$ ) with reactive electrophiles which were likely to react at low temperature, minimising the likelihood of ring-opening. In the event, it was found that generation of lithiated syn-8a could be accomplished by treatment with $n$ - BuLi at $-93^{\circ} \mathrm{C}$; after addition of DMPU as a co-solvent in order to maximise the nucleophilicity of the anion, low-temperature quenching with PhSSPh followed by acid yielded the thioacetal

Reagents and conditions: (i) $n$-BuLi, THF, $-93^{\circ} \mathrm{C}$; DMPU ( $10 \% \mathrm{v} / \mathrm{v}$ ), then $\operatorname{PhSSPh}(1.5 \mathrm{eq}),-93^{\circ} \mathrm{C} \rightarrow-78^{\circ} \mathrm{C}$, then $\mathrm{AcOH}-\mathrm{THF}$ ( 1 eq ); (ii) $\mathrm{CH}_{3} \mathrm{CO}_{3} \mathrm{H}\left(10 \mathrm{eq}\right.$ ), $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}-\mathrm{H}_{2} \mathrm{O}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{rt}, 12 \mathrm{~h}$.

## Scheme 6

$S, S$-dioxide 12 in high yield, and with excellent stereoselectivity. Although 12 is the product of approach of the electrophile from the more hindered face, syn- to the C-2 methyl group, this trajectory places the phenylsulfonyl group in the less hindered anti- orientation. Compound 12 entered into facile $S$-oxidation reactions, yielding the vinylic sulfone 13 directly $^{9}$ on exposure to peracid, together with a small amount of the disulfone 14 (Scheme 6). Compound 12 entered also into $\mathrm{C}-\mathrm{C}$ bond-forming reactions. Treatment of a $1: 1$ mixture of $\mathbf{1 2}$ and allyltrimethylsilane with $\mathrm{Et}_{2} \mathrm{AlCl}$ gave a $4: 1$ mixture of $\mathbf{1 5}$ and $\mathbf{1 6} ; \mathbf{1 6}$ was the sole product when $\mathrm{AlCl}_{3}$ was used instead of $\mathrm{Et}_{2} \mathrm{AlCl}$ in an otherwise identical reaction (Scheme 7). The formation of compounds 15 and 16 may be rationalised in terms of sequences involving (i) initial Lewis acid-mediated ionisation with loss of phenylsulfinate giving $\mathbf{A}$; (ii)
 ring oxygen-assisted 1,2 -migration of the $\mathrm{C}-2$ hydrogen, yielding an anchimerically sulfur-stabilised oxocarbenium ion $\mathbf{B} ;{ }^{10}$ (iii) trapping of this cationic species with a nucleophilic group (Et or allyl) from Al or Si . Whilst we have not carried out experiments to prove this mechanistic hypothesis, we have demonstrated the existence of oxygen-assisted 1,2-hydride shifts in related cationic systems in which the positive charge is stabilised initally by divalent sulfur. ${ }^{11}$

Reagents and conditions: (i) $\mathrm{AlCl}_{3}$ (1.1 equiv) added to syn-8a + allyltrimethylsilane, $\mathrm{CH}_{2} \mathrm{Cl}_{2},-78^{\circ} \mathrm{C}$.

## 3. CONCLUSIONS

The foregoing results demonstrate that for vinylic sulfone substrates 3 the 5 -endo-trig cyclisation reaction is a facile process which gives 2,5 -disubstituted tetrahydrofurans with moderate to excellent stereoselectivities. We have demonstrated also that one of the product tetrahydrofurans 8 may be elaborated in such a way as to enable a carbon-carbon bond-forming reaction on the THF template, and that this process is highly stereoselective. Related ongoing work in our laboratory is addressing the analogous pyrrolidine-forming reactions, ${ }^{12}$ particularly in the context of indolizidine-containing alkaloids, and the results of these studies will be reported in due course.

## General procedures

'H Nmr spectra were recorded on either Bruker AM-500, Jeol GX-270Q or Bruker WM-250 spectometers, using residual isotopic solvent ( $\mathrm{CHCl}_{3}, \delta_{\mathrm{H}}=7.26 \mathrm{ppm}$ ) as an internal reference. Infra-red spectra were recorded on a Perkin-Elmer 881 or a Mattson 5000 FTIR spectrometer. Mass spectra were recorded using VG-7070B or Jeol SX-102 instruments. Elemental combustion analysis were performed in the Imperial College Chemistry Department microanalytical laboratory. Melting points were measured on a Reichert hot stage apparatus and are uncorrected. Chromatography refers to flash column chromatography on Merck Kieselgel 60 (230-400 mesh). Tlc refers to thin-layer chromatography performed on pre-coated Merck Kieselgel $60 \mathrm{~F}_{254}$ glass-backed plates and visualized with ultraviolet light ( 254 nm ), iodine, acidic ammonium molybdate (IV), acidic ethanolic vanillin, aqueous potassium manganate(VII), 4, $4^{\prime}$-bis(dimethylamino)benzhydrol in acetone and acidic methanolic 2,4-dinitrophenylhydrazine, as appropriate. Reactions were carried out at room temperature (rt) unless otherwise stated. Ether and THF were distilled from sodium-benzophenone ketyl; $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ from phosphorus pentoxide; toluene and TMEDA from sodium wire and DMSO from calcium hydride. Where appropriate, all reagents were purified before use according to standard procedures. ${ }^{13}$

## Preparation of 3-(tert-butyldimethylsilyloxy)-1-(phenylsulfonyl)butane (4a).

Method A: To a stirred solution of (phenylsulfonyl)methane ( $1.56 \mathrm{~g}, 10.0 \mathrm{mmol}, 1.0$ equiv) in THF ( 38 ml ) under argon at $-78^{\circ} \mathrm{C}$ was added, dropwise via syringe $n$-BuLi ( 4.4 ml of a 2.5 M solution in hexanes, 11.0 mmol, 1.1 equiv). After stirring for 2 min at $-78^{\circ} \mathrm{C}$ the bright yellow solution was warmed to it in a water bath over 5 min , during which time a precipitate formed. DMPU ( $16 \mathrm{ml}, 30 \% \mathrm{v} / \mathrm{v}$ ) was added, causing the precipitate to dissolve, followed by 2-methyloxirane ( 0.73 ml in 1 ml of THF, $10.5 \mathrm{mmol}, 1.05$ equiv). Tlc after 15 min indicated complete reaction and the solution was then cooled to $0^{\circ} \mathrm{C}$ over 10 min . A pre-mixed/centrifuged mixture of TBDMSCl ( $3 \mathrm{~g}, 20 \mathrm{mmol}$, 2 equiv), $\mathrm{Et}_{3} \mathrm{~N}(3.6 \mathrm{ml}, 25.6 \mathrm{mmol}, 2.56$ equiv) and THF ( 12.4 ml ) ( 13 ml of mixture) was added dropwise to the solution causing it to become paler in colour. Tlc indicated complete reaction. After addition of water and separation of the organic phase, the aqueous layer was extracted with $\mathrm{EtOAc}(3 \times 150 \mathrm{ml})$. The combined organic layers were washed with saturated aqueous $\mathrm{NaHCO}_{3}(100 \mathrm{ml})$, and alternately with water ( 100 ml ) and brine ( $3 \times 100 \mathrm{ml}$ ), then dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated under reduced pressure to give a brown oil. ## Preparation of 5-(tert-butyldimethylsilyloxy)-3-phenylsulfonyl-2-hexanol 2-benzoate (5a).

Method D: To a stirred solution of silyl ether $4 \mathrm{a}(2.79 \mathrm{~g}, 8.49 \mathrm{mmol}, 1.0$ equiv) in THF ( 50 ml ) under argon at $78^{\circ} \mathrm{C}$ was added $n-\mathrm{BuLi}$ ( 5.98 ml of a 1.42 M solution in hexanes, $9.34 \mathrm{mmol}, 1.1$ equiv). After 5 min acetaldehyde ( 4.94 ml of a 5.16 M solution in THF, $25.47 \mathrm{mmol}, 3$ equiv) was added to the bright yellow solution, resulting in the discharge of most of the colour. Acetic acid $(5.82 \mathrm{ml}$ of a 1.75 M solution in THF, $10.19 \mathrm{mmol}, 1.2$ equiv) was added and the mixture allowed to warm to rt. After addition of water the organic phase was separated and the aqueous layer extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \times 50 \mathrm{ml})$. The combined organic layers were washed with water ( 200 ml ), dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated under reduced pressure to yield a colourless oil. This was purified by chromatography ( $33 \%$ ether-petrol) to give a $1: 1: 1: 1$ mixture of diastereomeric hydroxysulfones ( $2.83 \mathrm{~g}, 89 \%$ ). A portion of the hydroxysulfones ( $2.71 \mathrm{~g}, 7.28 \mathrm{mmol}, 1.0$ equiv) was dissolved in THF ( 28 ml ) and $n-\mathrm{BuLi}(3.2 \mathrm{ml}$ of a 2.5 M solution in hexanes, $8.0 \mathrm{mmol}, 1.1$ equiv) was added dropwise via syringe under argon at $-78^{\circ} \mathrm{C}$. After $2 \mathrm{~min} \mathrm{BzCl}(845 \mu \mathrm{l}, 7.28 \mathrm{mmol}, 1.0$ equiv) was added to the bright yellow solution. After a further 5 min at $-78^{\circ} \mathrm{C}$ the reaction was allowed to warm to rt , whereupon the colour was discharged. After addition of saturated aqueous $\mathrm{NaHCO}_{3}$, the organic phase was separated and the aqueous layer extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \times 75 \mathrm{ml})$. The combined organic layers were washed with 1 M aqueous $\mathrm{NaOH}(2 \times 120 \mathrm{ml})$, water ( $2 \times 80 \mathrm{ml}$ ), dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated under reduced pressure to give a pale yellow oil. This was purified by chromatography ( $16 \%$ ether-petrol) to give a $1: 1: 1: 1$ mixture of diastereomeric benzoates $5 \mathrm{a}\left(2.77 \mathrm{~g}, 80 \% ; 71 \%\right.$ over two steps from 4 a ) as a colourless oil; $\mathrm{R}_{f} 0.51,50 \%$ ether-petrol; $v_{\max }$ (film) $2930,2899,2859,1725,1604,1587,1473,1463,1448,1379,1320,1270,1178,1150,1085,1027$, $1004,975,907,837,809,777,745,714,689 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}}(500 \mathrm{MHz}) 8.00-7.80(12 \mathrm{H}$, m, ortho and para protons on $\mathrm{PhSO}_{2}$ ), $7.75-7.30\left(28 \mathrm{H}, \mathrm{m}\right.$, meta protons on $\mathrm{PhSO}_{2}$, ortho, meta and para protons on Ph$), 5.70-5.61(2 \mathrm{H}$, $\mathrm{m}, \mathrm{H}-2), 5.58(1 \mathrm{H}, \mathrm{dq}, \mathrm{J} 6.5,3.0 \mathrm{~Hz}, \mathrm{H}-2), 5.28(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-2), 4.30(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-5), 4.22(2 \mathrm{H}, \mathrm{m}, \mathrm{H}-5), 4.00$ ( $1 \mathrm{H}, \mathrm{m}, \mathrm{H}-5$ ), $3.79(1 \mathrm{H}, \mathrm{dt}, \mathrm{J} 8.5,30 \mathrm{~Hz}, \mathrm{H}-3), 3.64(1 \mathrm{H}, \mathrm{dt}, \mathrm{J} 7.5,4.0 \mathrm{~Hz}, \mathrm{H}-3), 3.42(1 \mathrm{H}, \mathrm{ddd}, \mathrm{J} 6.5$, $5.0,2.5 \mathrm{~Hz}, \mathrm{H}-3), 3.38(1 \mathrm{H}, \mathrm{d}, \mathrm{J} 8.0 \mathrm{~Hz}, \mathrm{H}-3), 2.40-1.85(8 \mathrm{H}, \mathrm{m}, \mathrm{H}-4), 1.61(3 \mathrm{H}, \mathrm{d}, \mathrm{J} 5.0 \mathrm{~Hz}, \mathrm{H}-1), 1.49$ (3H, d, J $6.5 \mathrm{~Hz}, \mathrm{H}-1), 1.47(3 \mathrm{H}, \mathrm{d}, \mathrm{J} 6.5 \mathrm{~Hz}, \mathrm{H}-1), 1.34(3 \mathrm{H}, \mathrm{d}, \mathrm{J} 6.5 \mathrm{~Hz}, \mathrm{H}-1), 1.27(3 \mathrm{H}, \mathrm{d}, \mathrm{J} 6.0 \mathrm{~Hz}, \mathrm{H}-$ 6), $1.23(3 \mathrm{H}, \mathrm{d}, \mathrm{J} 6.0 \mathrm{~Hz}, \mathrm{H}-6), 1.15(3 \mathrm{H}, \mathrm{d}, \mathrm{J} 6.0 \mathrm{~Hz}, \mathrm{H}-6), 1.08(3 \mathrm{H}, \mathrm{d}, \mathrm{J} 6.0 \mathrm{~Hz}, \mathrm{H}-6), 0.90(9 \mathrm{H}, \mathrm{s}, t-$

## Preparation of 6-(tert-butyldimethylsilyloxy)-2-methyl-4-phenylsulfonyl-3-heptanol 3benzoate (5b).

Method C: To a stirred solution of silyl ether $4 \mathbf{a}$ ( $1.5 \mathrm{~g}, 4.56 \mathrm{mmol}$, 1 equiv) in THF ( 9 ml ) under argon at $78^{\circ} \mathrm{C}$ was added, dropwise via syringe $n-\mathrm{BuLi}(2.18 \mathrm{ml}$ of a 2.3 M solution in hexanes, $5.01 \mathrm{mmol}, 1.1$ equiv). After 5 min at $-78^{\circ} \mathrm{C}$ isobutyraldehyde ( $455 \mu \mathrm{l}, 5.01 \mathrm{mmol}, 1.1$ equiv) was added to the bright yellow solution, causing the colour to fade slightly. DMPU ( 3.8 ml of a $30 \% \mathrm{v} / \mathrm{v}$ solution in THF) was added followed by BzCl ( $530 \mu \mathrm{l}, 4.56 \mathrm{mmol}, 1$ equiv) and the solution was allowed to warm to rt . After addition of saturated aqueous $\mathrm{NaHCO}_{3}$ the organic phase was separated and the aqueous layer was extracted with EtOAc ( $3 \times 50 \mathrm{ml}$ ). The combined organic layers were washed with 1 M aqueous $\mathrm{NaOH}(2 \times 30 \mathrm{ml}$ ), and alternately with water ( $3 \times 30$ ml ) and brine ( $3 \times 30 \mathrm{ml}$ ). ## Preparation of threo-enriched 1-(tert-butyldimethylsilyloxy)-1-phenyl-3-phenylsulfonyl-4pentanol (61).

To a stirred solution of silyl ether 4 i ( $3 \mathrm{~g}, 7.68 \mathrm{mmol}, 1.0$ equiv) under nitrogen at $-78^{\circ} \mathrm{C}$ in THF ( 38 ml ) was added $n$ - BuLi ( 3.4 ml of a 2.5 M solution in hexanes, 8.45 mmol , 1.1 equiv). After 5 min acetaldehyde ( 1.7 ml of a 4.87 M solution in THF, $8.06 \mathrm{mmol}, 1.05$ equiv) was added to the bright yellow solution, causing the discharge of most of the colour. Acetic acid ( 7.7 ml of a 1 M solution in THF, $7.68 \mathrm{mmol}, 1.0$ equiv) was added and the mixture allowed to warm to rt. After addition of water the organic phase was separated and the aqueous layer extracted with ether ( $3 \times 250 \mathrm{ml}$ ). The combined organic layers were washed with water ( 150 ml ) and brine ( 150 ml ), dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated under reduced pressure to yield a yellow oil which was purified by chromatography ( $20 \%$ ether-petrol) to give a $1: 1: 1: 1$ mixture of diastereomeric hydroxysulfones $61(2.9 \mathrm{~g}$, $87 \%$ ). A portion of this material ( $1.4 \mathrm{~g}, 3.22 \mathrm{mmol}, 1.0$ equiv) was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 32 ml ) and added to a mixture of powdered $4 \AA$ activated molecular sieves ( 3.2 g ) and PDC ( $1.8 \mathrm{~g}, 4.83 \mathrm{mmol}, 1.5$ equiv) under nitrogen at room temperature. After 3 h the brown mixture was diluted with ether and filtered through silica gel. The filtrate was concentrated under reduced pressure to yield a yellow oil which was purified by chromatography ( $10 \%$ EtOAc-petrol) to give a $1: 1$ mixture of diastereomeric ketones $71(1.3 \mathrm{~g}, 90 \%$ ) as a colourless oil. To a mixture of $\mathrm{CeCl}_{3} \cdot 7 \mathrm{H}_{2} \mathrm{O}(1.0 \mathrm{~g}, 2.77 \mathrm{mmol}, 1.0$ equiv) and ketones $71(1.2 \mathrm{~g}, 2.77 \mathrm{mmol}, 1.0$ equiv) in MeOH $(8 \mathrm{ml})$ at rt was added $\mathrm{NaBH}_{4}(210 \mathrm{mg}, 5.54 \mathrm{mmol}, 2.0$ equiv) in one portion. Gas and heat were evolved. After 25 min the mixture was poured into ether ( 30 ml ) and washed with aqueous $\mathrm{HCl}(0.1 \mathrm{M}, 30 \mathrm{ml})$; The organic phase was separated and the aqueous phase extracted with ether ( $4 \times 30 \mathrm{ml}$ ). The combined organic layers were washed with water ( $2 \times 50 \mathrm{ml}$ ) and brine ( $2 \times 50 \mathrm{ml}$ ). The organic phase was dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated under reduced pressure to yield a yellow oil which was purified by chromatography ( $20 \% \mathrm{EtOAc}$-petrol) to give a 3:3:1:1 mixture of diastereomeric alcohols $61(0.8 \mathrm{~g}, 67 \% ; 51 \%$ over three steps from $\mathbf{4 i})$ as a colourless oil; $\mathrm{R}_{\mathrm{f}} 0.31,50 \%$ ether-petrol; $v_{\text {max }}$ (film) $3510,2929,1447,1304,1146,1082,836,777,701 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}}(270 \mathrm{MHz}$ ) $7.92-7.80\left(4 \mathrm{H}, \mathrm{dd}, \mathrm{J} 8.5,2.0 \mathrm{~Hz}\right.$, ortho protons on $\mathrm{PhSO}_{2}$, minor diastereomer), 7.90-7.82 ( $4 \mathrm{H}, \mathrm{dd}, \mathrm{J} 8.5,2.0$ Hz , ortho protons on $\mathrm{PhSO}_{2}$, major diastereomer), 7.70-7.40 ( $12 \mathrm{H}, \mathrm{m}$, meta and para protons on $\mathrm{PhSO}_{2}$, major and minor diastereomer), $7.30-7.00(20 \mathrm{H}, \mathrm{m}, \mathrm{Ph}$, major and minor diastereomer), $4.95(1 \mathrm{H}, \mathrm{t}, \mathrm{J} 5.5 \mathrm{~Hz}, \mathrm{H}-1$, major diastereomer), $4.79(1 \mathrm{H}, \mathrm{t}, \mathrm{J} 8.5 \mathrm{~Hz}, \mathrm{H}-1$, minor diastereomer), $4.60-4.50(2 \mathrm{H}, \mathrm{m}, \mathrm{H}-1$, major and minor diastereomer), 4.40-4.30 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{H}-4$, major diastereomer), 4.22-4.12 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{H}-4$, minor diastereomer), $4.10(1 \mathrm{H}, \mathrm{d}, \mathrm{J} 10.0 \mathrm{~Hz}, \mathrm{OH}$, major diastereomer), $3.38-3.30(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-3$, major diastereomer), 3.25-3.19 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{H}-3$, major diastereomer), 3.08 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{H}-3$, minor diastereomer), $2.95-2.88(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-3$, minor diastereomer), $2.40-2.00(8 \mathrm{H}, \mathrm{m}, \mathrm{H}-2$, major and minor diastereomer), $1.62(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{OH}$, minor diastereomer), $0.99(1 \mathrm{H}, \mathrm{d}, \mathrm{J} 6.5 \mathrm{~Hz}, \mathrm{OH}$ major diastereomer), $0.80(49 \mathrm{H}, \mathrm{m}, \mathrm{H}-5, \mathrm{OH}$ minor diast and $t$ BuSi , major and minor diastereomer), 0.02 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{MeSi}$, major diastereomer), 0.00 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{MeSi}$, minor diastereomer), $-0.01(6 \mathrm{H}, \mathrm{s}, \mathrm{MeSi}$, major and minor diastereomer), $-0.16(3 \mathrm{H}, \mathrm{s}, \mathrm{MeSi}$, major diastereomer), 0.24 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{MeSi}$, minor diastereomer), -0.31 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{MeSi}$, major diastereomer), -0.32 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{MeSi}$, minor diastereomer); $m / z$ (EI) 377, 333, 235, 221, 199, 181, 161, 149, 143, 135, 117, 107, 91, 75,57 (Found: [M-t$\mathrm{Bu}]^{+}$, 377.1228. $\mathrm{C}_{23} \mathrm{H}_{34} \mathrm{O}_{4} \mathrm{SSi}$ requires $[\mathrm{M}-t-\mathrm{Bu}]^{+}, 377.1243$ ).

## Preparation of (E)-4-phenylsulfonyl-4-hexen-2-ol (3a).

To a stirred solution of benzoates $5 \mathrm{a}(2.63 \mathrm{~g}, 5.52 \mathrm{mmol}, 1.0$ equiv) in THF ( 80 ml ) under argon at rt was added, portionwise $t$-BuOK ( 6.35 ml of a 1.0 M solution in THF, $6.35 \mathrm{mmol}, 1.15$ equiv). The addition caused a transient yellow colour and the formation of a white precipitate, and towards the end of the addition the solution became pale yellow in colour. The reaction was quenched by the addition of saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ $(15 \mathrm{ml})$. The organic phase was separated and the aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 100 \mathrm{ml})$. The combined organic layers were washed with water ( 75 ml ), dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated under reduced pressure to give an orange oil. Chromatography ( $17 \%$ ether-petrol) gave the $E$-vinylic sulfone ( $1.83 \mathrm{~g}, 94 \%$ ) as a colourless oil. To a portion of this material ( $1.61 \mathrm{~g}, 4.53 \mathrm{mmol}, 1$ equiv) dissolved in $\mathrm{MeCN}(45 \mathrm{ml})$ at rt was added $\mathrm{HF}(1.9 \mathrm{ml}$ of a $48 \% \mathrm{w} / \mathrm{v}$ solution in water, $45.3 \mathrm{mmol}, 10$ equiv). After 1 h the reaction was quenched carefully with solid $\mathrm{NaHCO}_{3}$. After addition of water, the organic phase was separated and the aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 25 \mathrm{ml})$. The combined organic layers were washed with saturated aqueous $\mathrm{NaHCO}_{3}(50 \mathrm{ml})$, water $(50 \mathrm{ml})$, dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated under reduced pressure to give a colourless
solid. Chromatography ( $80 \%$ ether-petrol) gave $\mathbf{3 a}(1.07 \mathrm{~g}, 98 \%$; $92 \%$ over two steps from 5 a ) as a colourless oil; $\mathrm{R}_{f} 0.14,60 \%$ ether-petrol; $\mathrm{v}_{\text {max }}$ (film) $3517,2969,1648,1458,1448,1376,1305,1132,1082,933,738$, $690 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}}(250 \mathrm{MHz}) 7.90-7.82\left(2 \mathrm{H}, \mathrm{m}\right.$, ortho protons on $\left.\mathrm{PhSO}_{2}\right)$, 7.67-7.49 ( $3 \mathrm{H}, \mathrm{m}$, meta and para protons on $\mathrm{PhSO}_{2}$ ), $7.14(1 \mathrm{H}, \mathrm{q}, \mathrm{J} 7.0 \mathrm{~Hz}, \mathrm{H}-5), 4.03(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-2), 2.63(1 \mathrm{H}, \mathrm{d}, \mathrm{J} 4.0 \mathrm{~Hz}, \mathrm{OH}), 2.35(2 \mathrm{H}, \mathrm{d}, \mathrm{J} 6.0$ $\mathrm{Hz}, \mathrm{H}-3$ ), 1.90 ( 3 H, d, J $7.0 \mathrm{~Hz}, \mathrm{H}-6$ ) 1.19 ( $3 \mathrm{H}, \mathrm{d}, \mathrm{J} 6.0 \mathrm{~Hz}, \mathrm{H}-1$ ); m/z (EI) 225 [M-Me] ${ }^{+}, 196,143,77$ (Found: C, $60.20 ; \mathrm{H}, 6.50 . \mathrm{C}_{12} \mathrm{H}_{16} \mathrm{O}_{3} \mathrm{~S}$ requires $\mathrm{C}, 60.00 ; \mathrm{H}, 6.71 \%$ ).

Preparation of $(E)$ - and ( $Z$ )-1-(tert-butyldimethylsilyloxy)-1-phenyl-3-phenylsulfonyl-3-penten-1-ol (3i).
To a stirred solution of threo-enriched hydroxy sulfones $61(1 \mathrm{~g}, 2.30 \mathrm{mmol}, 1.0$ equiv) in THF ( 11.5 ml ) under nitrogen at $0^{\circ} \mathrm{C}$ was added $n-\mathrm{BuLi}(1 \mathrm{ml}$ of a 2.30 M solution in hexanes, $2.30 \mathrm{mmol}, 1.0$ equiv) causing the mixture to become yellow in colour. After stirring for $2 \mathrm{~min}, \mathrm{TsCl}(0.7 \mathrm{~g}, 3.45 \mathrm{mmol}, 1.5$ equiv) in THF was added via cannula resulting in the disappearance of the yellow colour. Saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ was added, the organic phase was separated and the aqueous phase extracted with EtOAc ( $4 \times 75 \mathrm{ml}$ ). The combined organic layers were washed with water ( 75 ml ), brine ( 75 ml ), dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated under reduced pressure
to yield a 3:3:1:1 mixture of diastereomeric tosylates as a colourless oil. To a stirred solution of the crude tosylates in EtOH ( 24 ml ) at rt was added $\mathrm{NaOEt}(4.76 \mathrm{ml}$ of a 1 M solution in $\mathrm{EtOH}, 4.76 \mathrm{mmol}, 2.0$ equiv), causing the mixture to become yellow in colour. After 30 min saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}(5 \mathrm{ml})$ was added, the organic phase was separated and the aqueous phase extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \times 50 \mathrm{ml})$. The combined organic layers were washed with brine ( $2 \times 50 \mathrm{ml}$ ), dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated under reduced pressure to yield a colourless oil which was purified by chromatography ( $20 \%$ ether-petrol) to give a $1: 1$ mixture of vinylic sulfone isomers ( $680 \mathrm{mg}, 71 \%$ ). To a stirred solution of the vinylic sulfones ( $0.68 \mathrm{~g}, 1.63 \mathrm{mmol}$ ) in $\mathrm{CH}_{3} \mathrm{CN}(20 \mathrm{ml})$ was added HF ( $48 \% \mathrm{w} / \mathrm{v}$ aqueous solution) dropwise until th revealed complete reaction. Solid $\mathrm{NaHCO}_{3}$ was added carefully and the organic phase separated. The aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \times 30 \mathrm{ml})$. The combined organic layers were washed with water ( 30 ml ), brine ( 30 ml ), water ( 30 ml ), saturated aqueous $\mathrm{NaHCO}_{3}(30 \mathrm{ml})$, water ( 30 ml ), dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated under reduced pressure to yield a colourless oil which was purified by chromatography ( $50 \%$ ether-petrol) to give ( $E$ )-3i and ( $Z-3 i$ ( $50: 50$ ratio; $51 \%$ combined yield over three steps from threo-enriched $6 \mathbf{6}$ ) as a colourless oil. ## Cyclisation reaction of ( $E$ )-3a.

To a stirred solution of alcohol (E)-3a ( $1.50 \mathrm{~g}, 6.24 \mathrm{mmol}, 1.0$ equiv) in THF ( 200 ml ) containing $t$ - BuOH $\left(2.87 \mathrm{ml}, 31.2 \mathrm{mmol}, 5\right.$ equiv: conditions $A$ ) under argon at $25^{\circ} \mathrm{C}$ was added $t$ - $\mathrm{BuOK}(6.24 \mathrm{ml}$ of a 1.0 M solution in THF, $6.24 \mathrm{mmol}, 1.0$ equiv), causing a bright yellow colouration. After 40 min at rt the reaction was quenched with acetic acid ( $357 \mu \mathrm{l}, 6.24 \mathrm{mmol}, 1.0$ equiv). Water was added, the organic phase was separated and the aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \times 150 \mathrm{ml})$. The combined organic layers were washed with water ( $3 \times 200 \mathrm{ml}$ ), dried $\left(\mathrm{MgSO}_{4}\right)$, and concentrated under reduced pressure to give a pale yellow oil. Preparation of [2R*,3S*,5S*]-2,5-dimethyl-3-phenylsulfenyl-3-(phenylsulfonyl)tetrahydrofuran (12).
To a stirred solution of $\operatorname{syn}-8 \mathrm{a}\left(500 \mathrm{mg}, 2.08 \mathrm{mmol}, 1.0\right.$ equiv) in THF ( 10 ml ) under argon at $-93^{\circ} \mathrm{C}$ was added, dropwise via syringe $n-\mathrm{BuLi}(1 \mathrm{ml}$ of a 2.3 M solution in hexanes, $2.30 \mathrm{mmol}, 1.1$ equiv) causing a bright yellow colouration. After 10 min at $-93^{\circ} \mathrm{C}$ DMPU ( 1.5 ml in 3.5 ml of THF, $10 \% \mathrm{v} / \mathrm{v}$ ) was added followed by $\mathrm{Ph}_{2} \mathrm{~S}_{2}$ ( 700 mg in 10 ml THF, $3.3 \mathrm{mmol}, 1.5$ equiv), both via cannula, causing some discharge of the colour. The reaction was allowed to warm to $-74^{\circ} \mathrm{C}$ and quenched by the addition of acetic acid ( 1.32 ml of a 1.75 M solution in THF, $2.29 \mathrm{mmol}, 1.1$ equiv). After the addition of water the organic layer was separated and
the aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \times 60 \mathrm{ml})$. The combined organic layers were washed with water ( $2 \times 60 \mathrm{ml}$ ), dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated under reduced pressure to give a yellow oil. This was purified by chromatography ( $30 \%$ ether-petrol) to give a $>20: 1$ mixture of diastereomeric tetrahydrofurans ( $640 \mathrm{mg}, 88 \%$ ) as a colourless solid. ## 5. ACKNOWLEDGEMENTS

We thank the SERC (Quota Studentship to A. M. S.), SERC/EPSRC and Wellcome Research Laboratories (Earmarked/CASE Studentship to N. J. I.), and ICI plc (Strategic Research Initiative) for financial support of this research. We acknowledge support from the Wolfson Foundation for establishing the Wolfson Centre for Organic Chemistry in Medical Science. We thank Ms Hilary O'Callaghan (Imperial College) for carrying out elemental combustion analyses. We gratefully acknowledge the SERC Mass Spectrometry Service Centre, University College of Swansea for providing some of the high-resolution mass spectra.
