Ring opening of the glycidonitriles (II a-e) by HF/pyridine leads to the fluorocyanohydrins (III a-e). Treatment of the fluorocyanohydrins with ammonia in anhydrous methanol gives the  $\alpha$ -amino- $\beta$ -fluoronitriles (IV a-e) which upon acidic hydrolysis afford the  $\beta$ -fluoro- $\alpha$ -aminoacids (V a-e) in good overall yield.
