Abstract — 2,5,8(1*H*)-Quinolinetriones (**12**), 2,5,6(1*H*)-quinolinetriones (**13**), 2-alkoxy-5,8-quinolinediones (**14**), 2,8-dimethoxy-5,6-quinolinedione (**15**), and 2,6-dimethoxy-7,8-quinolinediones (**16**) were synthesized by oxidative demethylation of the corresponding 2(1*H*)-quinolinones (**7**) and 2-alkoxyquinolines (**11**) with cerium (IV) ammonium nitrate.

Streptonigrin (**1**), a highly substituted 5,8-quinolinedione, was first reported as an antitumor antibiotic produced by *Streptomyces flocculus*.¹ It was later found to be one of the most potent inhibitors of avian myeloblastosis virus reverse transcriptase (AMV-RT), but its remarkable cytotoxic activity seemed to be disadvantageous with respect to a specific inhibitor of retrovirus.² Recently, we observed that synthetic 6-methoxy-5,8-quinolinediones (**2a**, **b**) and 8-methoxy-5,6-quinolinediones (**2c**, **d**) were much less toxic than **1**, while the activity of **2a-d** against AMV-RT was comparable to that of **1**.³ Furthermore, we examined the inhibition of AMV-RT by a series of quinolinequinones, isoquinolinequinones, and quinoxalinequinones.³ We wish to report here the synthesis of various 2(1*H*)-quinolinonequinones and 2-alkoxyquinolinequinones.

5,7,8-Trimethoxyquinoline (**5a**) and 5,6,8-trimethoxyquinolines (**5b-d**) prepared from the corresponding trimethoxyanilines (**4a-d**), were oxidized with *m*-chloroperoxybenzoic acid to give **6a-d**. The *N*-oxides (**6a-d**) were treated with acetic anhydride followed by aqueous potassium hydroxide to furnish the 2(1*H*)-quinolinones (**7a-d**). On the other hand, condensation of trimethoxyanilines (**4a-d**) and ethyl acetoacetate (**8**) in refluxing

toluene containing a catalytic amount of pyridine afforded the corresponding β -ketoanilides (**10e-h**). Acid catalyzed cyclization of **10e-h** gave 4-methyl-2(1*H*)-quinolinones (**7e-h**). Furthermore, 4-phenyl-2(1*H*)-quinolinones (**7i-k**) were prepared from the anilines (**4e, a, c**) and ethyl benzoylacetate (**9**), respectively.

Treatment of the 2(1*H*)-quinolinones (**7b-g, i-k**) with sodium hydride followed by methyl iodide afforded the corresponding *N*-methyl-2(1*H*)-quinolinones (**7l-t**, 49-84% yield) and 2-methoxyquinolines (**11l-t**, 14-34%

yield). In contrast, ethylation of 2-quinolinones (**7f, g, i, k**) with ethyl iodide gave the corresponding *N*-ethyl-2(1*H*)-quinolinones (**7u-x**, 16-41% yield), but the major product was 2-ethoxyquinolines (**11u-x**, 45-80% yield). Oxidative demethylation of 5,8-dimethoxy-2(1*H*)-quinolinones (**7i, r, w**) and 5,7,8-trimethoxy-2(1*H*)-quinolinones (**7a, e, j, o, s**) with cerium (IV) ammonium nitrate (CAN) in aqueous acetonitrile containing suspended pyridine-2,6-dicarboxylic acid *N*-oxide⁴ afforded the corresponding *p*-quinones (**12i, r, w, a, e, j, o, s**) in 24-78% yields; but no *o*-quinones. In contrast, 5,6,8-trimethoxy-2(1*H*)-quinolinones unsubstituted at *N*₁ or *C*₇ (**7b, c, f-h, k, l, p, u**) were oxidized with CAN under the same conditions to furnish the corresponding quinones (45-92% yield), which consisted of *p*-quinones (**12b, c, f-h, k, l, p, u**, 28-84% yield) and *o*-quinones (**13b, c, f-h, k, l, p, u**, 6-31% yield). Other 5,6,8-trimethoxy-2(1*H*)-quinolinones (**7d, m, n, q, t, v, x**) gave *p*-quinones (**12d, m, n, q, t, v, x**) and/or *o*-quinones (**13m, t**) in 7-36% yields.

In order to confirm the *p*-quinone structure for **12a, e, j**, we examined oxidation of 5,8-diethoxy-7-methoxy-2(1*H*)-quinolinones (**7a', e', j'**), prepared by the same method used for the corresponding 5,7,8-trimethoxy-2(1*H*)-quinolinones (**7a, e, j**). The 2(1*H*)-quinolinones (**7a', e', j'**) were oxidized with CAN to give the corresponding 7-methoxy-2,5,8(1*H*)-quinolinetrienes, which were identical to the quinones (**12a, e, j**) from 5,7,8-trimethoxy-2(1*H*)-quinolinones (**7a, e, j**), respectively.

Finally, we examined oxidative demethylation of 2-alkoxyquinolines (**11l-x**) with CAN. 5,6,8-Trimethoxyquinoline (**11l**) and 5,7,8-trimethoxyquinolines (**11o, s**) furnished the corresponding *p*-quinones (**14l, o, s**, 37-62% yield) and *o*-quinones (**15l, 16o, s**, 11-31% yield). Other 2-alkoxyquinolines (**11m, n, p-r, t-x**) gave only *p*-quinones (**14m, n, p-r, t-x**) in 57-89% yields. The spectral data of 2(1*H*)-quinolinonequinones (**12, 13**) and 2-alkoxyquinolinequinones (**14-16**) are given in Table I.

EXPERIMENTAL

All melting points were determined on a Yanagimoto micromelting point apparatus and are uncorrected. $^1\text{H-Nmr}$ spectra were measured at 270 MHz in CDCl_3 (unless otherwise noted) with tetramethylsilane as an internal standard. All reactions were run with magnetic stirring. Anhydrous sodium sulfate was used for drying organic solvent extracts, and the solvent was removed with a rotary evaporator and finally under high vacuum. Column chromatography (flash chromatography)⁵ was performed with silica gel 60 (230-400 mesh).

1,2,4-Trimethoxy-3-methyl-5-nitrobenzene (3c) and 3-Ethyl-1,2,4-trimethoxy-5-nitrobenzene (3d)

Concentrated HNO_3 (d 1.38, 20 ml) was added dropwise to a solution of 1,2,4-trimethoxy-3-methylbenzene⁶ (or 3-ethyl-1,2,4-trimethoxybenzene⁷) (50 mmol) in acetic acid (200 ml) for 5 min. The resulting solution was left for 1 h, poured into water (1000 ml), and extracted with CH_2Cl_2 (3 x 300 ml). The extract was washed with saturated aqueous NaHCO_3 solution and water, dried, and evaporated. The residue was chromatographed (eluting with CH_2Cl_2) to afford **3c** (or **3d**).

2,5-Diethoxy-1-methoxy-3-nitrobenzene (3a') A solution of 40% KOH (175 ml) was added dropwise to 2,5-dihydroxy-1-methoxy-3-nitrobenzene⁸ (25.15 g, 135 mmol) and diethyl sulfate (124 ml, 0.95 mol) in ethanol (300 ml) at 70°C. The resulting solution was heated at 70°C for 30 min, then cooled, diluted with water (800 ml), and extracted with CH_2Cl_2 (3 x 800 ml). The extract was washed with 5% NaOH solution (2 x 500 ml) and water, dried, and evaporated. The residue was chromatographed (eluting with ethyl acetate-hexane 2:8) to afford **3a'** (27.67 g, 84%). mp 58-59°C (ethyl acetate). $\text{Ms } m/z$ (%): 241 (M^+ , 82), 213 (100), 185 (73). *Anal.* Calcd for $\text{C}_{11}\text{H}_{15}\text{NO}_5$: C, 54.77; H, 6.27; N, 5.81. 2,4,5-Trimethoxy-3-methylaniline (4c), 3-Ethyl-2,4,5-trimethoxyaniline (4d), and 2,5-Diethoxy-3-methoxyaniline (4a') A mixture of **3c** (or **3d**, **3a'**) (25 mmol), Sn (23.7 g, 0.2 mol) and concentrated HCl (60 ml) was heated at 60-70°C for 1 h. The reaction mixture was cooled, adjusted to pH 9-10 with 10% NaOH solution, and extracted with CH_2Cl_2 (3 x 100 ml). The extract was washed with water, dried, and evaporated to afford **4c** (or **4d**, **a'**).

Oxidative Demethylation of 2(1H)-Quinolines (7a-x, a', e', j') and 2-Alkoxyquinolines (11l-x) A solution of CAN (1370 mg, 2.5 mmol) in acetonitrile-water (1:1, 7.5 ml) was added dropwise to **7a-x, a', e', j'** or **11l-x** (0.5 mmol) dissolved in acetonitrile-water (4:1, 25 ml) containing pyridine-2,6-dicarboxylic acid *N*-oxide (458 mg, 2.5 mmol) at 0-5°C. The mixture was kept at 0-5°C for 30 min, diluted with water (65 ml), and extracted with CH_2Cl_2 (3 x 25 ml). The extract was washed with brine, dried and evaporated. The residue was chromatographed (eluting with ethyl acetate-hexane, ethyl acetate-methanol, or ethyl acetate- CH_2Cl_2) to afford the corresponding *p*-quinones (**12** or **14**) and/or *o*-quinones (**13**, **15** or **16**).
