

Asymmetric Reduction of Prochiral 3-Aryl-3-oxoesters with Lithium Borohydride using *N,N'*-Dibenzoylcystine as a Chiral Auxiliary

Kenso Soai,* Takashi Yamanoi, Hitoshi Hikima, and Hidekazu Oyamada

Department of Applied Chemistry, Faculty of Science, Science University of Tokyo, Kagurazaka, Shinjuku-ku, Tokyo 162, Japan

Optically active 3-aryl-3-hydroxyesters of high enantiomeric excess (80–92% e.e.) are obtained by the reduction of 3-aryl-3-oxoesters with lithium borohydride which has been chirally modified with *N,N'*-dibenzoylcystine and *t*-butyl alcohol.

Optically active 3-hydroxyesters (1) form an important class of compounds.¹ Asymmetric reductions of 3-oxoesters (2) to (1) by microbial² or chemical (modified Raney nickel³) methods are known. However, very few examples of the reduction of (2; R¹ = aryl) have been reported.^{2a}

During our continuing study on chemoselective⁴ and asymmetric⁵ reduction with complex borohydrides, we observed a highly enantioselective reduction of (2; R¹ = aryl) by LiBH₄ partially decomposed with *N,N'*-dibenzoylcystine (3) and Bu^tOH. When ethyl benzoylacetate (2b) was reduced in the presence of (*R,R'*)-(3), (*R*)-(+)-(1b) was obtained in 94% yield and in 87% enantiomeric excess (%e.e., Table 1, entry 2).† The chiral auxiliary was recovered in over 70% yield.

† (*S*)-(-)-(1b), produced *via* yeast reduction {[α]_D²⁰ -25.8° (c 1.3, CHCl₃)}, ref. 2a, is claimed to be optically pure based on the lit. value of [α]_D²⁰ +19.2° (c 1.0, CHCl₃) (J. Kenyon, H. Phillips, and G. R. Schutt, *J. Chem. Soc.*, 1935, 1663). However, the specific rotation of our (*S*)-(-)-(1b) had a larger value: [α]_D²² -40.8° (c 1.03, CHCl₃) (Table 1, entry 3).

Esters of sec-, tert-alcohols (2c, e), and ethyl 1-naphthoyleacetate (2i) were found to be slightly more effectively reduced, thus the %e.e.'s of (1c, e, i) reached 90% (entries 4, 6, and 10).

- a; R¹ = Ph, R² = Me
- b; R¹ = Ph, R² = Et
- c; R¹ = Ph, R² = Prⁱ
- d; R¹ = Ph, R² = Buⁿ
- e; R¹ = Ph, R² = Bu^t
- f; R¹ = Ph, R² = *n*-Hexyl
- g; R¹ = *p*-Tolyl, R² = Et
- h; R¹ = 4-MeO-C₆H₄, R² = Et
- i; R¹ = 1-Naphthyl, R² = Et

(3) = *N,N'*-Dibenzoylcystine, THF = tetrahydrofuran

Table 1. Asymmetric reduction of (2) to (1).^a

(1)				
Entry (2)	Yield (%)	$[\alpha]_D^{22}$ (c, solvent)	Enantiomeric excess (% e.e.) ^b	Configuration
1 a	78	+16.0° (4.80, EtOH)	84(87 ^c)	<i>R</i> ^c
2 b	94	+43.1° (3.11, CHCl ₃)	87(79 ^d)	<i>R</i> ^d
3 ^e b	93	-41.5° (3.40, CHCl ₃) -40.8° (1.03, CHCl ₃) ^f	86(76 ^d)	<i>S</i> ^d
4 c	83	+38.7° (2.61, CHCl ₃)	91	
5 d	83	+35.2° (3.78, CHCl ₃)	80	
6 e	88	+9.6° (3.03, EtOH)	90	
7 f	66	+31.6° (4.87, CHCl ₃)	86	
8 g	88	+38.6° (4.59, CHCl ₃)	85	
9 h	85	+35.7° (5.26, CHCl ₃)	84	
10 i	90	+62.3° (3.55, CHCl ₃)	92	

^a Molar ratio of (2):LiBH₄:(3):Bu^tOH = 1.0:3.6:1.2:1.6. Temperature (-78 → -30°C). Unless otherwise noted, (*R,R'*)-(3) was used. ^b Determined by ¹H n.m.r. spectroscopic analyses of the corresponding (-)-α-methoxy-α-(trifluoromethyl)phenylacetic acid esters, J. A. Dale, D. L. Dull, and H. S. Mosher, *J. Org. Chem.*, 1969, **34**, 2543. ^c Based on the reported value of (*R*)-(1a) $[\alpha]_D^{24}$ +18.3° (c 4.78, EtOH), C. Schoepf and W. Wuest, *Ann.*, 1959, **626**, 150. ^d Based on the reported value of (*S*)-(1b) $[\alpha]_D^{22}$ -54.9° (c 3.5, CHCl₃), S. G. Cohen and S. Y. Weinstein, *J. Am. Chem. Soc.*, 1964, **86**, 725. ^e (*S,S'*)-(3) was used. ^f Data measured in different concentration. See footnote[†].

One of the advantages of the present procedure over microbial methods is its easy access to either enantiomer of (1). The reduction of (2b) using either (*R,R'*)-(3) or (*S,S'*)-(3) afforded the corresponding enantiomer of (1b) in almost the same yield and %e.e. (entries 2 and 3).
