The configuration at the 2-position of 2-(*p*-bromophenyl)-*N*-methyl-4-phenyl-1,3-oxazolidine (**2a**) was determined by X-ray analysis. The reactions of 2,4-diphenyl- and 2-methyl-4-phenyl-1,3-oxazolidines (**2b–d** and **2e–g**) with methyl and phenylmagnesium bromides were investigated.

Keywords absolute configuration; organomagnesium complex; Grignard reaction; immonium salt intermediate; 1-phenylethylamine; (*R*)-phenylglycinol; 4-phenyl-1,3-oxazolidine; stereoselective reaction; X-ray analysis

Chiral 1,3-oxazolidines are easily obtained by the condensation of (*R*)- and (*S*)-2-hydroxyethylamines with carbaldehydes, and these compounds play an important role in the stereoselective Grignard reaction.^{1–3} However, the structures have not been fully elucidated because it was considered difficult to determine them by circular dichroism (CD)¹ and nuclear magnetic resonance (NMR)^{2,4} spectral analyses. Initially,⁵ the structure of 1,3-oxazolidine synthesized from *l*-ephedrine and *p*-bromobenzaldehyde was reported to have *trans* configuration at the 2-position of the ring. But, this structure was revised to *cis* configuration on the basis of an X-ray analysis.⁶ In this paper, we wish to describe the structure of 2-(*p*-bromophenyl)-*N*-methyl-4-phenyl-1,3-oxazolidine (**2a**), and the stereoselective Grignard reaction of **2a** and analogous compounds (**2b–g**).

The *N*-substituted 4-phenyl-1,3-oxazolidines (**2a–g**) were synthesized by the condensation of *N*-substituted (*R*)-phenylglycinols [*N*-methyl (**1a**),⁷ *N*-benzyl (**1b**),⁸ and *N*-isopropyl (**1c**)⁹] with carbaldehydes (*p*-bromobenzaldehyde, benzaldehyde, and acetaldehyde). These products were shown to consist of mixtures of two diastereomeric isomers; the minor component amounted to less than 5% as judged from the ¹H-NMR spectra, except in the case of the *N*-benzyl derivatives (**2c** and **2f**) where the ratios of the major to the minor components were 85:15 and 88:12. It was not possible to isolate the major product owing to cleavage of the 1,3-oxazolidine ring during column chromatography. The major product in the case of **2a** was purified by recrystallization.

Chart 1

The absolute configuration of **2a** was elucidated by X-ray analysis. A colorless columnar crystal of **2a** was used. The atomic numbering of **2a** is shown in Fig. 1, and the crystal data are summarized in Table I.

Stereoscopic drawings of the molecular structure are shown in Fig. 2. The positional and thermal parameters with their standard deviations are listed in Table II. The intramolecular bond distances and bond angles for nonhydrogen atoms are given in Table III.

It was determined that the substituent at the 2-position of the ring in **2a** is attached in a *cis* relationship to the phenyl group at the 4-position. The structures of the major products of **2b–g** may be assumed to have the same configuration because the reactions of **1a–c** with carbaldehydes are expected to proceed *via* a similar reaction mechanism. We had tentatively assigned the *trans* configuration to **2e** based on ¹³C-NMR spectrometric analysis,² but the *cis* configuration was clearly indicated for the structures of 4-phenyl-1,3-oxazolidines obtained from (*R*)-phenylglycinols and carbaldehydes in the present work.

(*R*)-phenylglycinol and benzaldehyde gave a mixture [(*R*)-6] of (*R*)-*N*-benzylidene-2-hydroxy-1-phenylethylamine and 2,4-diphenyl-1,3-oxazolidines. The product [(1*R*,1'*R*)-5] was derived from the mixture [(*R*)-6] and was proved to be identical with (1*S*,1'*S*)-5 obtained from (*S*)-4 by ¹H-NMR spectral comparison. Thus, the *N*-methylation product of (1*R*,1'*R*)-5 was identical with the minor product [(1*R*,1'*R*)-3b] obtained from 2b.

The reduction of the mixture of (1*S*,1'*R*)- and (1*R*,1'*R*)-3a (ratio, 66:34) with lithium aluminum hydride (LiAlH₄) gave a mixture of (1*S*,1'*R*)- and (1*R*,1'*R*)-3b (ratio, 65:35) in 87% yield. On the other hand, the mixture of (1*S*,1'*R*)- and (1*R*,1'*R*)-3c (ratio, 84:16) gave (*S*)-*N*-benzyl-1-phenylethylamine¹¹⁾ upon oxidative cleavage with lead tetraacetate, while (1*S*,1'*R*)-3d gave (*S*)-*N*-isopropyl-1-phenyl-

ethylamine¹²⁾ when subjected to the same oxidative cleavage.

The configurations of the major products obtained from 2b—d were the same as those of the minor products obtained from 2e—g, as shown in Chart 3, and so it was considered that the stereoselective Grignard reactions of the *N*-substituted 4-phenyl-1,3-oxazolidines occur by a similar reaction mechanism. Moreover, the stereoselectivity of this reaction was suggested to increase with increasing bulkiness of the *N*-substituent, *i.e.*, methyl < benzyl < isopropyl, as shown in Table IV. Consequently, we propose a possible reaction mechanism in which the Grignard reagent approaches the oxygen atom of the 1,3-oxazolidine ring to give a favorable intermediate immonium salt, and nucleophilic attack occurs from the *si*-face of the carbon–nitro-

gen double bond as shown in Chart 5.

Experimental

The ^1H -NMR spectra were obtained with a JEOL JNM-GSX270 spectrometer, and the mass spectra (MS) were recorded with a JEOL JMS-D300 spectrometer by using the chemical ionization (CI) (isobutane) and the electron impact (EI) methods. The melting points were measured with a Yanagimoto micromelting point apparatus and are uncorrected. The optical rotations were measured at 20–23 °C with a JASCO DIP-360 digital polarimeter.

Condensation of (R)-1a–c with Benzenecarbaldehydes A mixture of (R)-1a–c (10 mmol) and benzenecarbaldehyde (*p*-bromobenzaldehyde and benzaldehyde, 11 mmol) in benzene (25 ml) was refluxed for 2–30 h using a Dean–Stark trap. The mixture was concentrated under reduced pressure to give 4-phenyl-1,3-oxazolines (2a–d).

Crystallographic Measurements A single crystal of (2*R*,4*R*)-2a was grown in ethanol as a colorless column with dimensions of $0.4 \times 0.4 \times 0.3$ mm. All the measurements were performed on a Rigaku AFC-5 diffractometer using graphite-monochromated $\text{Cu K}\alpha$ radiation. The unit cell dimensions were determined by least-squares calculation with 24 high-angle reflections.

Intensity data were collected by using the $2\theta/\omega$ scan technique with an average scan rate of 4°/min. In total, 1445 independent reflections with $0^\circ < 2\theta < 130^\circ$ were collected, and 1031 satisfying the condition $F_0 \geq 3\sigma(F)$ were used for calculations.

Structure Analysis and Refinement The structure was solved by the heavy atom method, and the Rigaku crystallographic package RASA-II. The structure was refined by the block-diagonal least-squares technique with anisotropic thermal factors for all nonhydrogen atoms. The *R* factor was finally reduced to 0.097.

Reaction of (2*R*,4*R*)-2a–d with CH_3MgBr CH_3MgBr (4.8 mmol, 1.6 ml of 3 M solution of ether) was added dropwise to a stirred solution of (2*R*,4*R*)-2a–d (1.6 mmol) in tetrahydrofuran (THF) (15 ml) at –10 °C under a nitrogen atmosphere. After being stirred at room temperature for 20 h, the reaction mixture was treated with a small amount of water, and the resulting white precipitate was filtered off. The filtrate was dried over

MgSO₄, and concentrated under reduced pressure. The residue was subjected to column chromatography on silica gel with *n*-hexane-ether (2:1) to give a diastereomeric mixture of (1*S*,1'*R*)- and (1*R*,1'*R*)-**3a**—**d** as a colorless oil. The experimental data are summarized in Table IV.

Reaction of (2*R*,4*R*)-2e**—**g** with C₆H₅MgBr** C₆H₅MgBr (9 mmol, 9 ml of 1 M solution of THF) was added dropwise to a stirred solution of (2*R*,4*R*)-**2e**—**g** (3 mmol) in THF (15 ml) at -10 °C under a nitrogen atmosphere, and the stirring was continued at room temperature for 20 h. After treatment of the reaction mixture as described for the reaction of (2*R*,4*R*)-**2a**—**d**, a diastereomeric mixture of (1*R*,1'*R*)- and (1*S*,1'*R*)-**3b**—**d** was obtained as a colorless oil. The experimental data are summarized in Table IV.

Reduction of (*S*)-4**** (*S*)-**4** (2.07 g, 7 mmol) was added dropwise to a stirred suspension of LiAlH₄ (0.53 g, 14 mmol) in THF (100 ml), and stirring was continued at room temperature for 20 h. After treatment with a small amount of water, the resulting white precipitate was filtered off. The filtrate was dried over MgSO₄ and concentrated under reduced pressure to give a colorless oil (1.45 g, 86%). The diastereomeric mixture was subjected to column chromatography on silica gel with a solution of *n*-hexane-ether (2:1) to give (1*S*,1'*S*)-**5** (0.5 g, 30%) from the first fraction and (1*S*,1'*R*)-**5** (0.63 g, 37%) from the second fraction.

(1*S*,1'*S*)-**5**: The ¹H-NMR (CDCl₃) spectrum of this compound coincided with that of (1*R*,1'*R*)-**5** (*vide infra*). [α]_D +16.0° (*c* = 4.60, CHCl₃). (1*R*,1'*R*)-*N*-2'-Hydroxy-1'-phenylethyl-1-phenylethylamine (**5**) A mixture of (*R*)-phenylglycinol (5.5 g, 40.2 mmol) and benzaldehyde (4.7 g, 44.2 mmol) in benzene (40 ml) was refluxed for 3 h using a Dean-Stark trap. The reaction mixture was washed with brine and dried over MgSO₄. The removal of the solvent gave a crystalline solid (7.0 g, 78%). Recrystallization from *n*-hexane-ether gave colorless needles of mp 72—72.5 °C. Anal. Calcd for C₁₅H₁₅NO: C, 79.97; H, 6.71; N, 6.22. Found: C, 79.72; H, 6.71; N, 6.19. This product was confirmed to be a mixture of (*R*)-*N*-benzylidene-2-hydroxy-1-phenylethylamine and 2,4-diphenyl-1,3-oxazolidines by ¹H-NMR spectral analysis. The ratio of the mixture was determined to be 85:15 by peak-area measurement at δ 8.40 (N=CH) and δ 5.60 and 5.67 (NCHO).

CH₃Li (5.6 mmol, 4 ml of 1.4 M solution in ether) was added dropwise to a stirred solution of the mixture of the imine and 1,3-oxazolidines (0.42 g, 1.87 mmol) in THF (30 ml) at -50 °C under a nitrogen atmosphere. After being stirred at room temperature for 2 h, the reaction mixture was treated with a small amount of water. The resulting white precipitate was filtered off. The filtrate was dried over MgSO₄ and concentrated under reduced pressure. The residue was chromatographed on a silica gel column with CH₂Cl₂-MeOH (99:1) to give (1*R*,1'*R*)-**5** (0.4 g, 82%) as a colorless oil, bp 149 °C (0.6 mmHg). MS *m/z*: Cl, 242 (*M*⁺ + 1); EI, 105 (base peak). ¹H-NMR (CDCl₃) δ: 1.37 (3H, d, *J* = 6.7 Hz, CHCH₃), 3.51 (1H, dd, *J* = 7.9, 10.4 Hz, NCHCH₂O), 3.74 (1H, dd, *J* = 4.9, 7.9 Hz, NCHCH₂O), 3.78 (1H, q, *J* = 6.7 Hz, CHCH₃), 3.89 (1H, dd, *J* = 4.9, 10.4 Hz, NCHCH₂O), 7.19—7.36 (10H, m, aromatic H). Methylation of (1*R*,1'*R*)-5**** CH₃I (1.3 g, 9.1 mmol) and K₂CO₃ (100 mg) were added to a stirred solution of (1*R*,1'*R*)-**5** (0.137 g, 0.57 mmol) in *N,N*-dimethylformamide (DMF, 3 ml), and stirring was continued at room temperature for 20 h. The mixture was poured into water (30 ml) and extracted with ether. The organic layer was dried over MgSO₄ and concentrated under reduced pressure. The residue was chromatographed on a silica gel column with *n*-hexane-ether (2:1) to give (1*R*,1'*R*)-**3b** as a colorless oil (0.11 g, 75%). This product was identical with the minor product obtained by the reaction of (2*R*,4*R*)-**2b** on the basis of ¹H-NMR spectral comparison.

Reduction of **3a** A solution of a mixture of (1*S*,1'*R*)- and (1*R*,1'*R*)-**3a** (ratio of 66:34, 0.267 g, 0.8 mmol) in THF (5 ml) was added dropwise to a stirred suspension of LiAlH₄ (0.1 g, 2.4 mmol) in THF (10 ml) and the stirring was continued at room temperature for 18 h. After treatment with a small amount of water, the resulting white precipitate was filtered off. The filtrate was dried over MgSO₄ and concentrated under reduced pressure to give **3b** as a colorless oil (0.18 g, 87%). This product was identical with the mixture of (1*S*,1'*R*)- and (1*R*,1'*R*)-**3b** (ratio of 65:35) on the basis of the ¹H-NMR spectral comparison.

Oxidation of **3c** Lead tetraacetate (1.77 g, 4 mmol) was added to a solution of a mixture of (1*S*,1'*R*)- and (1*R*,1'*R*)-**3c** (ratio of 84:16, 0.66 g, 2 mmol) in benzene (40 ml) and the mixture was stirred at room temperature for 23 h. After treatment with a small amount of dilute hydrochloric acid, the reaction mixture was made alkaline with K₂CO₃ saturated aqueous solution, and extracted with benzene. The combined organic layer was washed with brine, dried over MgSO₄, and concentrated under reduced pressure. The residue was subjected to column chromatography on silica gel with *n*-hexane-ether (2:1) to afford an enantiomeric mixture of (*S*)- and (*R*)-*N*-benzyl-1-phenylethylamines (0.28 g, 66.5%). The structure was confirmed by ¹H-NMR spectral analysis and the specific rotation was shown to be [α]_D -38.0° (*c* = 3.48, EtOH) [lit.,¹¹] (*S*)-*N*-benzyl-1-phenylethylamine: [α]_D -56.9° (*c* = 4.50, EtOH)].

Oxidation of (1*S*,1'*R*)-3d Lead tetraacetate (4.07 g, 9.2 mmol) was added to a solution of (1*S*,1'*R*)-3d (1.3 g, 4.6 mmol) in benzene (40 ml). The mixture was stirred at room temperature for 20 h and then worked up in the same manner as above to give (*S*)-*N*-isopropyl-1-phenylethylamine (0.44 g, 58.8%). $[\alpha]_D -59.7^\circ$ ($c=6.76$, EtOH) [lit.,¹²) (*S*)-*N*-isopropyl-1-phenylethylamine: $[\alpha]_D -59.5^\circ$ (neat)].
