Just Accepted

"Just Accepted" manuscripts have been peer-reviewed and accepted for publication. They are posted online prior to technical editing, formatting for publication and author proofing. The American Chemical Society provides "Just Accepted" as a free service to the research community to expedite the dissemination of scientific material as soon as possible after acceptance. "Just Accepted" manuscripts appear in full in PDF format accompanied by an HTML abstract. "Just Accepted" manuscripts have been fully peer reviewed, but should not be considered the official version of record. They are accessible to all readers and citable by the Digital Object Identifier (DOI®). "Just Accepted" is an optional service offered to authors. Therefore, the "Just Accepted" Web site may not include all articles that will be published in the journal. After a manuscript is technically edited and formatted, it will be removed from the "Just Accepted" Web site and published as an ASAP article. Note that technical editing may introduce minor changes to the manuscript text and/or graphics which could affect content, and all legal disclaimers and ethical guidelines that apply to the journal pertain. ACS cannot be held responsible for errors or consequences arising from the use of information contained in these "Just Accepted" manuscripts.

Formal Syntheses of (\pm) -Platensimycin and (\pm) -Platencin via a Dual-Mode Lewis Acid Induced Cascade Cyclization Approach

Abstract

A mild and efficient dual-mode Lewis acid induced Diels Alder (DA)/carbocyclization cascade cyclization reaction has been developed for construction of the tricyclic core of *ent*-kaurenoids in one pot with the aid of a theoretical study on the π , σ -Lewis acidities of a variety of Lewis acids. With ZnBr₂ as the dual-mode Lewis acid, a series of substituted enones and dienes underwent DA/carbocyclization cascade cyclization reaction smoothly at room temperature and provided the tricyclic cyclized products in one pot with good yields and high diastereoselectivity. The tricyclic cyclized product has been successfully utilized as a common intermediate for formal syntheses of (\pm)-platensimycin and (\pm)-platencin.

Introduction

Platensimycin (1)¹ and Platencin (2)² are potent bacterial type II fatty acid biosynthesis inhibitors, which were isolated from Streptomyces patensis MA 7327 and 7339 by a research group at Merck & Co., Inc. in 2006 and 2007 respectively. Both platensimycin platencin **(2) (1)** and bear same 3-amino-2,4-dihydroxybenzoic acid side-chain with a different cage structure (an oxatetracyclic structure for platensimycin and a tricyclic carbocycle for platencin) (Figure 1). A recent study suggested that the biosynthesis of platensimycin (1) involved an ent-kaurene type intermediate that was derived from ent-copalyl pyrophosphate (CPP).³⁻⁴ Platensimycin (1) is a potent and selective inhibitor of FabF (the enzyme that catalyzed the elongation step in bacterial fatty acid synthesis), while

platencin (2) is a moderate inhibitor of both FabF and FabH (the enzyme that catalyzed the initial condensation step in bacterial fatty acid synthesis). 2 With their unique mode of biological actions, these natural products showed potent antibacterial activities against a broad spectrum of multi-drug resistant Gram-positive pathogens, including methicillin-resistant Staphylococcus (MRSA) aureus and vancomycin-resistant *Enterococcus* (VRE) with no observed toxicity.⁵⁻⁹ However, the development of platensimycin (1) and platencin (2) into promising drug candidates has been greatly limited by their poor in vivo efficacy and pharmacokinetic properties. 10 As such, a tremendous amount of effort 11-18 has been invested in the synthesis of platensimycin¹⁹⁻⁵¹ and platencin⁵²⁻⁷² as well as their structural analogues. Up to now, only a very limited number of platensimycin and platencin analogues have been reported to be more potent than the parent natural products;⁴³ and the development of structural analogues of platensimycin (1) and platencin (2) with improved in vivo efficacy and pharmacokinetic properties remains a challenge. Therefore, developing an efficient and versatile synthetic entry to platensimycin and platencin analogues is important for facilitating the development of these natural products into promising leads in drug discovery.

FIGURE 1. Tricyclic core of *ent*-kaurenoids (**I**) and examples of *ent*-kaurene related natural products

Dual-mode Lewis acids⁷³⁻⁷⁷ are useful for developing cascade cyclization reactions since they can induce cyclization reactions via forming σ- and/or π-complexes with the substrates as well as the intermediate(s) that are generated *in situ*. We are particularly interested in developing dual mode Lewis acid induced cascade cyclization reactions for natural product syntheses since they can often construct the core structure of the synthetic target in a single operation under mild conditions.⁷⁸⁻⁸³ Recently, we have developed the ZnBr₂ catalyzed Diels Alder (DA)/carbocyclization cascade cyclization reaction for the rapid construction of *cis*-hydrindanes and demonstrated its utilities in natural product synthesis.⁸⁰ As such, we have decided to employ this strategy for developing a new cascade cyclization reaction that could give a rapid access to the tricyclic fused ring system I (Figure 1), which is an important structural motif of the *ent*-kaurene related natural products⁸⁴⁻⁸⁶ and is anticipated to provide rapid access to the cage structures of platensimycin (1)

and platencin (2).

As shown in Figure 2, our strategy involved a Lewis acid induced DA cycloaddition of enone 3a with diene 4a. The resulting silyl enol ether of the DA adduct 5a could undergo intramolecular carbocyclization with the alkyne to form the bicycle[3.2.1]octane moiety of 6a in a one-pot manner. This strategy requires a mild dual-mode Lewis acid that can form σ -complexes with enone 3a for inducing the DA cycloaddition, and π -complexes with intermediate 5a for inducing the carbocyclization without causing hydrolysis of silyl enol ethers 4a and 5a. We have previously reported the dual-mode Lewis acid induced DA/carbocyclization cascade cyclization reaction for construction of the 6,6,5-tricyclic cyclized product 6a, and its application in the formal synthesis of platensimycin (1). We herein report the computational and experimental details on the method development, and demonstrate the utilities of the cascade reaction by employing the cyclized product (6a) as a common building block for the formal syntheses of (\pm) -platensimycin (1) and (\pm) -platencin (2).

Results and Discussion

1. Theoretical investigation of the binding enthalpies of Lewis acids towards σ and π -electrons

In search of a suitable dual-mode Lewis acid for developing the DA/carbocyclization cascade cyclization reaction, the binding enthalpies between a variety of Lewis acids and the π/σ complex partners, including propene/acetaldehyde (Table 1) and styrene/benzaldehyde (Table S1 in Supporting Information), were evaluated by density-functional theory (DFT) calculations. As shown in Table 1 and Table S1, only slight differences in binding enthalpies were found between the alkyl and aryl compounds. In general, Lewis acids based on the main-group elements, such as MgX₂ and AlX₃, have stronger σ -binding than π -binding. On the other hand, the π -binding enthalpies of the transition metal based Lewis acids, such as AuCl and Pd(OAc)₂, are higher, owing to the π back-bonding from the d-electrons of the transition metal to π^* orbital of substrates. These results are consistent with a similar theoretical study on the B3LYP/SDD values of a smaller set of Lewis acids reported by Yamamoto.⁷⁵

^a See the experimental section for the computational methods.

To induce the DA/carbocyclization cascade cyclization reaction, the π/σ -binding energies of the Lewis acid should be high enough to promote sequential cyclization reactions. To identify the appropriate Lewis acid for the cascade reaction, the π -binding enthalpies (ΔH_{π}) were plotted against the differences of π/σ -binding enthalpies ($\Delta H_{\pi} - \Delta H_{\sigma}$). As shown in Figure 3, Zn(II), In(III) and Fe(III) based Lewis acids have similar properties (within the box in Figure 3) with π -binding enthalpies of $-10 \sim -30$ kcal mol⁻¹ and σ/π -binding enthalpy differences ($\Delta H_{\pi} - \Delta H_{\sigma}$) of $-2 \sim -7$ kcal mol⁻¹. More importantly, we have previously demonstrated that In(III) and Zn(II) are effective dual-mode Lewis acids for inducing the Prins/Conia-ene^{78,81} and Michael/Conia-ene^{79,82} cascade cyclization reaction respectively. Taking these results into consideration, we identified a sub-group of Lewis acids that are promising for the development of the DA/carbocyclization cascade cyclization reaction.

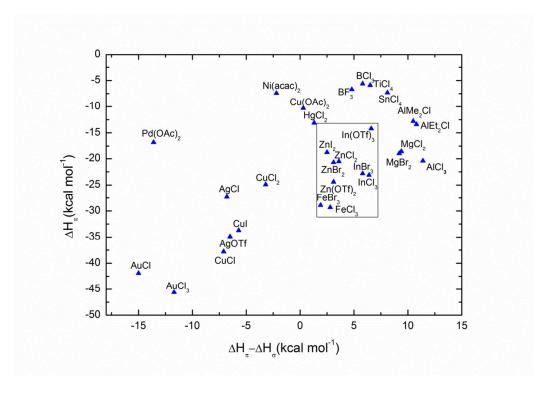

FIGURE 3. The plot of π -binding enthalpies (ΔH_{π}) versus the differences of π/σ binding enthalpies $(\Delta H_{\pi} - \Delta H_{\sigma})$

2. Screening of dual-mode Lewis acids

Based on the above analysis, the reaction between enone **3a** and diene **4a** was studied using a variety of In(III), Zn(II) and Fe(III) based Lewis acids. As shown in Table 2, InCl₃ in acetonitrile led to an 80% yield of side-product **7**, which could be formed via hydration of the alkyne moiety of **3a** even under anhydrous conditions (Table 2, entry 1). However, employing the same condition for various protected but-3-yn-1-ols did not lead to any methyl ketone products (data not shown). These results indicated that the ketone moiety of **3a** could be cyclized with the In(III)-activated alkyne and form the cyclic enol ether intermediate (**9-[In]** in Figure **5**), which could lead to the methyl ketone side-product (**7**) upon hydrolysis. Switching the Lewis acid to InBr₃ resulted in only a trace amount of the expected cyclized

product (**6a**) along with 60% of **7** (entry 2). In(OTf)₃ also gave side-product **7** in 90% yield (Table 2, entry 3). Switching the solvent to dichloromethane resulted in rapid decomposition of the substrates (Table 2, entry 4-6).

TABLE 2. In(III) as the dual-mode Lewis acid for the cascade reaction^a

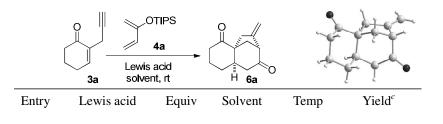

OTIPS

The activities of a number of Zn(II) and Fe(III) based Lewis acids were then investigated. As shown in Table 3, no cyclization was observed when using Zn(II) triflate or halides in acetonitrile (Table 3, entry 1-4). FeCl₃/CH₃CN resulted in the hydrolysis of **4a** (Table 3, entry 5). Switching the solvent to dichloromethane with Zn(II) triflate did not give any cyclized product (Table 3, entry 6), and the silyl enol ether diene (**4a**) was hydrolyzed slowly under these reaction conditions. Finally, we found that the cascade cyclization went smoothly by using Zn(II) halides in dichloromethane and afforded the tricyclic product (**6a**) bearing the *cis*-decalin

^a The general procedures were followed. ^b Isolated yields (%) after silica gel column chromatography.

efficiently and diastereoselectively (Table 3, entry 7-9). The reaction of 3a and 4a in the presence of FeCl₃ in CH₂Cl₂ led to about 40% of **6a** (Table 3, entry 10). Silvl enol ether 4a was hydrolyzed rapidly under these conditions. The optimal reaction conditions are ZnBr₂ (1.5 equiv) in CH₂Cl₂ at room temperature for 12 hours. These mild conditions afforded the expected cyclized product (6a) in 86% yield as a single diastereomer (Table 3, entry 8), which was characterized unambiguously by NMR experiments⁸⁷ and X-ray crystallography⁸⁸. Interestingly, Zn(OTf)₂/LiBr in CH₂Cl₂ also afforded good yields of cyclized product 6a (Table 3, entry 11), suggesting that the addition of LiBr could facilitate the formation of a Zn(II) bromide dimer, which is presumably one of the active species under the reaction conditions.⁸⁹ However, ZnBr₂/LiBr gave only a trace amount of **6a** (Table 3, entry 12) hence the effect of LiBr is not clear in this situation. The extra LiBr might occupy the vacant site of the active species or promote the formation of unreactive metal halide clusters. A brief survey on the effects of solvents showed that ZnBr₂ in chloroform afforded a similar yield (Table 3, entry 13), but THF, 1,4-dioxane, toluene or hexanes did not provide any cyclized product (Table 3, entry 14-17). The silyl enol ether diene (4a) was hydrolyzed slowly under these conditions. Reducing the loading of ZnBr₂ to 0.3 equivalents led to an incomplete reaction, and afforded only a 30% yield of 6a (Table 3, entry 18). Increasing the reaction temperature resulted in a similar result (Table 3, entry 19).

^a The general procedures were followed. ^b one equivalent of LiBr was added. ^c Isolated yields (%) after silica gel column chromatography.

Since Al(III) based Lewis acids are known effective promoters for DA cycloadditions and are reported to be effective for carbocyclization with *endo*-selectivity, ⁹⁰ a variety of Al(III) Lewis acids were studied. As shown in Table 4, no reaction was observed with EtAlCl₂ in acetonitrile and the silyl enol ether was hydrolyzed under these conditions (Table 4, entry 1). Switching the solvent to toluene

gave only the DA adduct 5a, which was then hydrolyzed and gave modest yields of side-product 5b (Table 4, entry 2) after aqueous work-up. Switching the solvent to CH₂Cl₂ provided only a trace amount of the 6,6,5-tricyclic product (6a) along with about 30-40% of side-product 5b after aqueous work-up (Table 4, entry 3), while the potential 6,6,6-tricyclic product was not observed. Et₂AlCl or Me₂AlCl in CH₂Cl₂ followed by addition of ZnBr₂ afforded 40 and 60% yields of the 6,6,5-tricylic product 6a respectively (Table 4, entry 4-5). These results indicated that Al(III) behaved more like an σ -Lewis acid in our system, which is consistent with the results of the above theoretical study.

3. Computational investigation on the mechanism of the cascade reaction

The mechanism of the DA/carbocyclization cascade cyclization reaction was studied by DFT calculations. The potential energy surfaces (PES) of the cascade

^a The general procedures were followed. ^b Isolated yields (%) after silica column chromatography.

reaction, with and without ZnCl₂, are shown in Figure 4. The free energy barrier of the DA reaction between unactivated **3a** and **4a** was calculated to be 32.1 kcal/mol, implying that the reaction is unlikely to take place at room temperature. In the presence of ZnCl₂, the free energy barrier for DA reaction is reduced to 25.4 kcal mol⁻¹ (blue curve in Figure 4). ZnCl₂ activates **3a** through a σ-coordination to the carbonyl group. Following the rate-determining Diels Alder reaction, **5a-[Zn]-π,σ** undergoes carbocyclization with a free energy barrier of 17.9 kcal mol⁻¹. Inspired by Yu's work, ⁸⁹ we also considered the possibility of dimeric [ZnCl₂]₂ as a catalyst. Indeed, the reaction catalyzed by [ZnCl₂]₂ was calculated to be more favorable with an overall activation free energy of 22.2 kcal mol⁻¹. [ZnCl₂]₂ may bind to carbonyl and alkynyl with two Zn atoms, thus decreasing the strains. More importantly, dimeric [ZnCl₂]₂ stabilizes **8-[Zn]** by distributing the negative charges over the dimeric Zn moiety. The computational finding of the dimeric model could also account for the different reactivities of Zn(OTf)₂ and Zn(OTf)₂/LiBr (entries 6 and 11 in Table 3).

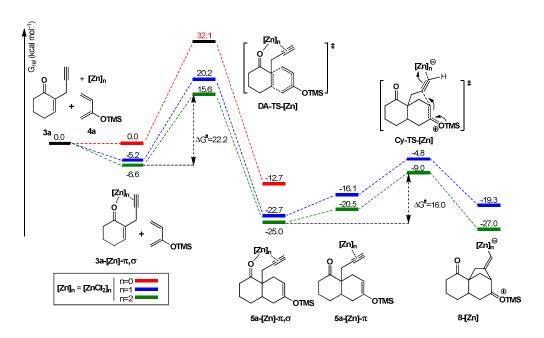

FIGURE 4. Potential Energy Surfaces of the cascade cyclization reaction of enone with diene in the absence (red lines) and presence of ZnCl₂ (blue line) or (ZnCl₂)₂ (green line) calculated at

M06/BSII//M06/BSI. Relative free energies at 298K are given in kcal mol⁻¹

4. A comparison study on the effect of different Lewis acids

To understand the different reactivity of In(III), Al(III) and Zn(II) based Lewis acids, further DFT calculations were conducted. The three potential energy surfaces of the reactions involving InCl₃, AlMe₂Cl, or [ZnCl₂]₂ were shown in Figure 5. The DA/carbocyclization cascade cyclization reaction is shown on the right side, while the competitive heterocyclization is shown on the left side. The results of the DFT calculations suggest different behaviors of these three Lewis acids. The [ZnCl₂]₂ catalyzed cascade reaction has been discussed above. Compared to the σ -complex **3a-[Zn]-\pi,** σ , the initial π -complex **3a-[Zn]-\pi** is less favorable by 7.3 kcal mol⁻¹. The relative free energy of the transition state for heterocyclization **HCy-TS-[Zn]** is lower than that of the DA reaction **DA-TS-[Zn]**. However, the following intermediate **9-[Zn]** is rather unstable, with a reaction free energy of 11.0 kcal mol⁻¹ referring to **3a-[M]**. This implies that the cascade reaction is much more favorable thermodynamically.

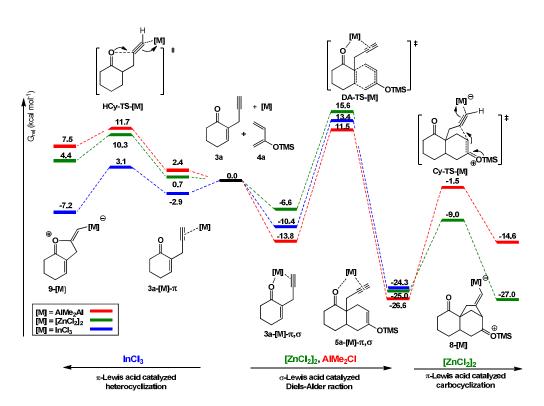

FIGURE 5. Potential-energy surfaces computed for the reaction of enone with diene catalyzed by AlMe₂Cl (red), [ZnCl₂]₂ (green) or InCl₃ (blue) calculated at M06/BSII//M06/BSI. Relative free energies at 298K are given in kcal mol⁻¹.

For the case with $InCl_3$, both the activation free energy and reaction free energy for the heterocyclization are significantly lower than those of $ZnCl_2$. Combining the DFT results with the experimental observations, we propose that $InCl_3$ preferentially mediated the intramolecular heterocyclic reaction which would lead to the product **9-[In]** and then the side product **7** after hydrolysis. The AlMe₂Cl mediated heterocyclization, however, is highly unfavorable (similar to that of $ZnCl_2$). Furthermore, the weak $Al-\pi$ interaction cannot activate the carbocyclization process both kinetically and thermodynamically. The free energy the barrier is 9.1 kcal/mol higher than that of the $ZnCl_2$ catalyzed process and the intermediate is 12.0 kcal/mol higher in free energy than the DA intermediate, implying that the reaction catalyzed

by AlMe₂Cl is likely to stop at the first step. This is consistent with the experimental results.

Based on this theoretical study, $InCl_3$ is a better π -Lewis acid that activates the triple bond to promote the intramolecular heterocyclic reactions of the enone. AlMe₂Cl is a better σ -Lewis acid that can only promote the DA reaction by coordinating to the carbonyl as a σ -Lewis acid whereas $ZnCl_2$ is a dual-mode Lewis acid that efficiently induces the cascade cyclization reaction, acting both as a σ and then as a π Lewis acid.

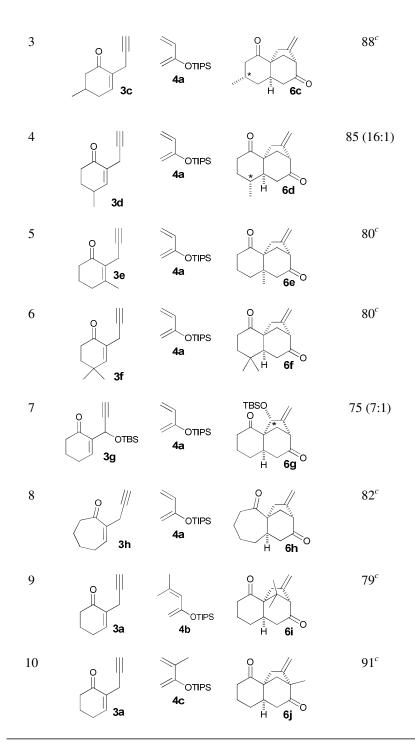

5. Study on the scope of substrates

With the optimal conditions in hand, the scope of the substrates was studied with a series of substituted enones (3a-h) and dienes (4a-c). As shown in Table 5, methyl substituents at C1 to C4 of the enone were well tolerated and gave comparable yields and diastereoselectivity of the cyclized products (6b-e) (Table 5, entry 2-5). The diastereoselectivities of 6b-c would be rationalized based on the preliminary conformational analysis in Figure 6. Addition of diene 4a is expected from the face that is *anti* to the methyl substituent. More importantly, the geminal dimethyl substituent at C3 also afforded good yields of cyclized product 6f (Table 5, entry 6). This result indicated that a quartenary carbon center adjacent to the reactive site can be tolerated under this cyclization condition. Introducing an OTBS moiety at C5 also afforded good yields and good diastereoselectivity (Table 5, entry 7). The observed diastereoselectivity of 6g would be rationalized by a non-chelating Felkin-Anh model in Figure 6. The OTBS group preferentially orientates *anti* to the carbonyl for

minimization of the dipole, and addition of diene **4a** is anticipated from the face that is *anti* to the OTBS group. These results indicate that these substituted enones and dienes not only afford comparable results, but also provide a handle for developing asymmetric reactions via substrate control. Moreover, the 7-membered enone (**3h**) also gave good yields and good diastereoselectivity for the cyclized product **6h** (Table 5, entry 8), which could be a useful building block for the syntheses of grayanane-type diterpenes. Diene **4b**, which bears two methyl substituents at the reactive site (C6) for the DA cycloaddition also reacted smoothly and gave the cyclized product (**6i**) as a single diastereomer (Table 5, entry 9). The intermediate that arose from the double Michael reaction pathway was not observed under these reaction conditions. Diene **4c**, which bears a methyl group at C7 (the reactive site for the carbocyclization), also afforded a very good yield (91%) of the cyclized product (**6j**) diastereoselectively (Table 5, entry 10).

6. Applications in natural product synthesis

To demonstrate the utility of this cascade cyclization reaction, the cyclized product **6a** was employed as a common precursor for the formal synthesis of platensimycin (**1**) and platencin (**2**). The retrosynthesis of **1** is showed in Scheme 1. The cage structure of the Snider's intermediate²¹ (**10**) could be established via selective reduction of ketone **11**, followed by acid-induced cationic cyclization. Ketone **11** could be obtained via 1,2-carbonyl migration of compound **12**, which could be prepared readily by differentiation of the two ketone moieties of **6a**. The retrosynthesis of **2** also employs **6a** as the starting material. As shown in Scheme 1, the bicyclo[2.2.2]octane moiety of the Nicolaou's intermediate⁵² (**13**) is expected to be established by radical rearrangement of **14**, which could be obtained from **15** via a 1,3-allylic rearrangement. Compound **15** could be also obtained from **6a** via differentiation of the ketone moieties.

SCHEME 1. Retrosynthetic analysis of platensimycin 1 and platencin 2 from 6a

7. Formal synthesis of (\pm) -platensimycin 1

Since both synthetic strategies involve the differentiation of two ketone moieties in **6a**, the conditions for direction reaction with the ketones were first investigated. Based on the preliminary conformational analysis of **6a**, the two ketone moieties should have significant differences in the steric hindrance that could be exploited for differentiation. However, treatment with 1 equivalent of a bulky hydride, such as L, K-selectride or DIBAL, resulted in a roughly 3:1 mixture of **16a** and **16b** (Scheme 2) based on the NMR analysis of the crude product. Reduction of **6a** with NaBH₄ in a variety of conditions resulted in non-selective reduction. Reaction between **6a** and tosyl hydrazine resulted in a roughly 1:1 mixture of hydrazones (**17a** and **17b**) based on the NMR analysis of the crude product.

SCHEME 2. Attempts of ketone differentiation of 6a

Diketone **6a** was thus converted to the silyl enol ethers (**18a-c**), which were epoxidized using a variety of oxidants. As shown in Table 6, epoxidation of **16a** with DMDO resulted in decomposition of the substrate (Table 6, entry 1). Switching the oxidant to *m*CPBA selectively afforded 10% of α-hydroxy ketone **19** as a single diastereomer along with about 20% of **6a** recovered (Table 6, entry 2). More bulky silyl enol ethers (**18b** and **18c**) led to an increase in yields to 30 and 60% respectively (Table 6, entry 3-4). The yield of **19** was further optimized by using magnesium monoperoxyphthalate (MMPP), which provided **19** in 65-80% (Table 6, entry 5-7). The optimal yield was obtained from **18c** with MMPP as the oxidant at room temperature, which gave 80% yield of **19** with no hydrolysis of the silyl enol ethers being observed (Table 6, entry 7).

^aThe crude intermediates (**18a-c**) were used without purification. ^bIsolated yields after silica gel column chromatography. MMPP = magnesium monoperoxyphthalate

With 19 prepared, it was converted to ketone 12 via hydroxyl-directed reduction followed by elimination of the resulting diol (Scheme 3). P2-93 This protocol provided 10 in 75% yield. Silyl enol formation followed by MMPP epoxidation of 12 provided α-hydroxyl ketone 20 as a single diastereomer. However, acetylation of 20 under various acidic conditions resulted in a mixture of acetal isomers (21a and 21b). After a survey of different acid conditions, we found that 20 can be equilibrated to 22 qualitatively and diastereoselectively with 2 N aqueous HCl overnight. Indeed, the α-hydroxylation of 22 with MMPP and equilibrium can be done conveniently in a one-pot manner, and the diastereomer bearing the *trans*-decalin was not observed under these reaction conditions. The resulting alcohol of 22 was then acetylated and deacetoxylated using SmI₂. Finally, reduction of ketone 11 with K-selectride followed by treatment of trifloroacetic acid afforded the Snider's intermediate (10), which could be converted to 1 according to the literature procedures.

SCHEME 3. Formal synthesis of Platensimycin **1**

8. Formal synthesis of (\pm) -platencin 2

For the formal synthesis of **2**, enone **15** was expected to be obtained via dehydration of α-hydroxyl ketone **19**. However, decomposition of **19** resulted under a variety of dehydration conditions. Preparation of enone **15** via oxidation of **6a** and **18a-c** was then examined. As shown in Scheme 3, oxidation of **6a** using IBX provided 10-30% of the expected enone **13**. Switching the substrate to **18a-c** increased the yield of **15** up to 58% (from **18c**). Under these oxidation conditions, the reactions needed to be stopped before completion to avoid over-oxidation. Finally, the yield of **15** was optimized via bromination of **18c**, followed by elimination.

SCHEME 4. Synthesis of enone **15** via selective oxidation or bromination

With enone 15 in hand, the two ketones were reduced using Luche reduction of conditions (Scheme 5). The resulting diol 25 is a single diastereomer. Acetylation of 25 afforded diacetate 26 in good yield. The 1,3-allylic rearrangement of 25 and 26 were investigated with a variety of acids 95-97 and Pd catalysts 98-102 respectively. However, these conditions resulted in either no reaction or decomposition of substrates. The allylic alcohol of 25 was thus selectively oxidized with MnO₂ (Scheme 6). After TBS protection of 28, enone 29 was converted to 31 stereoselectively via the Wharton transposition protocol. After a number of protecting and functional group manipulations, the bicycle[3.2.1]octane moiety was converted to the bicycle[2.2.2]octane using Yoshimitsu's procedures. Finally, oxidative removal of the PMB ether followed by oxidation of the resulting alcohol finished the synthesis of the Nicolaou's intermediate 12 (13), which can also be converted to 2 according to the literature procedures.

SCHEME 5. Study on the 1,3-allylic rearrangement

SCHEME 6. Formal synthesis of Platencin 2

9. Optimization of the ketone differentiation

The differentiation was further optimized by exhaustive reduction of the diketone with sodium borohydride (diol 34, a roughly 3:1 diastereomeric mixture) followed by selective TBS protection, which afforded 35 in 78% yield as a roughly 3:1

diastereomeric mixture from **6a** (Scheme 7). The diastereomers are separable and the stereochemistry of the major diastereomer of **35** was determined by NMR experiments. Since the two newly generated stereogenic centers will be removed in the late stage of the synthesis, all the diastereomers can be used for the synthesis of **1** and **2**. Triflation of **35** followed by elimination afforded **37**. Finally, desilylation of **36** followed by oxidation of the resulting alcohol provided ketone **12**, which could lead to Snider's intermediate **10** in only 7 steps. Oxidation of alcohol **35** followed by Saegusa oxidation afforded enone **29**, which can lead to Nicolaou's intermediate **13** in 8 steps.

SCHEME 7. Optimization of the ketone differentiation of **6a**.

Conclusion

In summary, we have evaluated the π/σ -binding properties of 29 commonly used Lewis acids in a theoretical study and successfully identified a sub-class of Lewis acids, including In(III), Zn(II) and Fe(III) halides, with similar π/σ -binding properties.

With the aid of these theoretical studies, we have developed a mild DA/carbocyclization cascade cyclization reaction with ZnBr₂ (1.5 equiv) as the dual-mode Lewis acid mediator, which rapidly provided the 6,6,5-trycylic fused cyclized product 6a from two simple substrates (3a and 4a). The mechanism of this cascade reaction was further studied via a comparison study between In(III), Zn(II) and Al(III) induced reactions by DFT calculations. Under the optimal conditions (ZnBr₂ in CH₂Cl₂ at room temperature), a variety of substituted enones 3a-h and dienes 4a-c underwent cascade cyclization smoothly and afforded the cyclized products (6a-j) in one pot with good yields and high diastereoselectivity. The utility of this new cascade reaction has been successfully demonstrated by employing cyclized product 6a as the common building block for the formal synthesis of (±)-platensimycin (1) and (±)-platencin (2) (43% in 10 steps and 38% in 11 steps overall yields from 6a respectively).

Experimental Section

General Computational Methods

All the calculations were carried out with the Gaussian 09 package. Geometry optimizations and frequency calculations were performed with the M06 method the M06 method the M106-110 with BSI (the LANL2DZ basis set set and corresponding effective core potentials (ECPs) for other atoms). The transition state (TS) were confirmed by frequency calculation and intrinsic reaction coordinate (IRC) calculations. All the TS stationary points were correctly connected to the corresponding species. Vibrational frequency calculations also provide thermal corrections for enthalpies and Gibbs free energies (at 298.15 K and 1 atm). For reaction energy profile, single point energies were calculated at the M06 level with a larger basis sets BSII (def2-TZVP with ECP for In 127 and 6-311++G(3df,3pd) for other atoms). Solvent effects were taken into account by using the SMD solvation model.

General Experimental Methods

All air- and water-sensitive reactions were carried out under a nitrogen atmosphere with dry solvents under anhydrous conditions, unless otherwise noted. Reactions were monitored by thin-layer chromatography (TLC) carried out on 0.25 mm silica gel plates (60F-254) that were analyzed by fluorescence upon 254 nm irradiation or by staining with KMnO₄ (200 mL H2O of 1.5 g KMnO₄, 10 g K₂CO₃ and 1.25 mL of 10% aqueous NaOH). Silica gel (60, particle size 0.0400.063 mm) was used for flash column chromatography. All the chemicals were purchased commercially and used without further purification. Anhydrous THF was distilled from

sodium-benzophenone. Toluene was distilled over Na. CH_3CN and CH_2Cl_2 were distilled from calcium hydride. Molecular sieves were activated by heating at 200 °C for 12 hours at ~1.0 Torr. Yields refer to the isolated yields after silica gel flesh column chromatography, unless otherwise stated. NMR spectra were recorded on either a 300 (1H: 300 MHz, ^{13}C : 75.5 MHz) or 500 MHz (^{1}H : 500 MHz, ^{13}C : 125.8 MHz) spectrometer. The NOESY experiments were performed on a 500 or 600 MHz spectrometer. The following abbreviations were used to explain themultiplicities: s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, br = broad. High-resolution mass spectra were obtained from a MALDI-TOF mass Spectrometer. Melting points were uncorrected and determined on a micro-melting point meter. Crystallographic data were obtained from a single crystal X-ray diffractometer. All the IR spectra were recorded with a FTIR spectrometer.

2-(Prop-2-yn-1-yl)cyclohex-2-enone (3a),

4,4-dimethyl-2-(prop-2-yn-1-yl)cyclohex-2-enone (3f) and

2-(prop-2-yn-1-yl)cyclohept-2-enone (3h)

To a stirred solution of NaOMe (prepared from sodium (1.25 g, 5.43 mmol) and CH₃OH (30 mL)) in methanol (50 mL) at 0 °C was added a solution of methyl thioglycolate (5.52 g, 5.21 mmol) in methanol (20 mL). After 5 minute stirring at 0 °C, a solution of the appropriate enone (5.21 mmol) in methanol (20 mL) was added dropwise at the same temperature. The reaction mixture was allowed to warm to room temperature slowly and heated under reflux for 10 hours. After removal of the

volatiles, the resulting orange residue was dissolved in diethyl ether (50 mL) and extracted with a 2 N NaOH aqueous solution (30 mL×2). The combined aqueous layer was acidified with a 1 N HCl aqueous solution (60 mL), extracted with diethyl ether (50 mL×2), dried over Na₂SO₄, filtered and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 10:1) afforded an orange-yellow liquid as the product. To a solution of this crude product in dry acetone (50 mL) was added powdered K₂CO₃ (3.6 g, 26.1 mmol) and 3-bromoprop-1-yne (2.5 g, 20.8 mmol). The reaction mixture was refluxed for 4 hours. After TLC analysis showed the consumption of the starting material, the volatiles were removed in vacuo. The residue was poured onto ice/water and extracted with diethyl ether (100 mL \times 2). The combined extracts dried over Na₂SO₄, filtered and concentrated. The residue was dissolved in diethyl ether (50 mL) and a 5% NaOH aqueous solution (50 mL) was added. The reaction mixture was stirred for 4 hours at room temperature. Then the organic layer was separated and washed with saturated NaHCO₃ solution followed by brine solution (50 mL×2). After removal of the volatiles, the residue was purified by silica flash column chromatography (hexanes/ethyl acetate = 20:1). 3a: (a yellow oil, 35% in 3 steps from cyclohex-2-enone). 3f: (a yellow oil, 32% in 3 steps from 4,4-dimethylcyclohex-2-enone) 1 H NMR (400 MHz, CDCl₃) δ 6.82 (s, 1H), 3.12 (t, J =2.0 Hz, 2H), 2.50-2.46 (t, J = 6.8 Hz, 2H), 2.18 (t, J = 2.4 Hz, 1H), 1.85 (t, J = 6.80 Hz, 2H), 1.18 (s, 6H); ¹³C NMR (100 MHz, CDCl₃) δ 197.9, 155.3, 130.9, 80.7, 71.8, 36.0, 34.3, 33.0, 27.8, 18.9; IR (neat, cm⁻¹): 2941, 2864, 1680, 1430, 1273, 1236, 1162, 876, 766; HRMS (ESI/[M+H]⁺) calcd. for $C_{11}H_{15}O$: 163.1123, found 163.1117. **3h**: (a

yellow oil, 32% in 3 steps from cyclohept-2-enone) ¹H NMR (400 MHz, CDCl₃) δ 6.99 (tt, J = 6.4, 1.6 Hz, 1H), 3.19-3.17 (m, 2H), 2.62 (t, J = 6.12 Hz, 2H), 2.49-2.45 (m, 2H), 2.18 (t, J = 2.6 Hz, 1H), 1.80-1.75 (m, 4H); ¹³C NMR (100 MHz, CDCl₃) δ 202.9, 143.5, 137.4, 81.3, 71.7, 42.3, 27.4, 24.9, 21.6, 21.1; IR (neat, cm⁻¹): 2941, 2864, 1680, 1430, 1273, 1236, 1162, 876, 766; HRMS (ESI/[M+H]⁺) calcd. for C₁₀H₁₃O: 149.0966, found 149.0962.

2-(1-((tert-Butyldimethylsilyl)oxy)prop-2-yn-1-yl)cyclohex-2-enone (3g)

To a stirred mixture of 3-(trimethylsilyl)propiolaldehyde (4.5 g, 35.3 mmol), imidazole (3.0 g, 44.13 mmol) and TBAI (0.40 g, 1.06 mmol) in THF (35 mL) and a 1 N NaHCO₃ aqueous solution (140 mL) was added cyclohex-2-enone (6.8 mL, 70.6 mmol) at room temperature. The resulting mixture was stirred at room temperature for 48 hours, then quenched with a 1 N HCl aqueous solution (100 mL), and extracted with CH₂Cl₂ (50 mL×3). The combined organic extracts were washed with brine, dried over Na₂SO₄, filtered and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 1:1) provided a colorless oil (4.02 g, 26.8 mmol, 76%) as the intermediate. 2-(1-hydroxyprop-2-yn-1-yl)cyclohex-2-enone (39): ¹H NMR (400 MHz, CDCl₃) δ 7.27 (t, J = 4.0 Hz, 1H), 5.23 (s, 1H), 3.56 (d, J = 4.8 Hz, 1H), 2.57-2.56 (m, 1H), 2.48-2.42 (m, 4H), 2.03-1.97 (m, 2H); ¹³C NMR (100 MHz, CDCl₃) δ 199.5, 148.2, 137.3, 81.7, 74.8, 60.9, 38.2, 25.6, 22.3; IR (neat, cm⁻¹): 3480, 3307, 2920, 2857, 1682, 1070; HRMS (ESI/[M+H] $^+$) calcd. for $C_0H_{11}O_2$: 151.0759, found 151.0768. To a stirred solution of 39 (1.44 g, 9.6 mmol) in CH_2Cl_2 (50 mL) was added imidazole (1.31 g, 19.2 mmol) and TBSCl (2.17 g, 14.4 mmol). The reaction mixture was stirred at room temperature for 4 hours, and then quenched with a saturated NaHCO₃ aqueous solution (20 mL). The aqueous layer was extracted with CH₂Cl₂ (20 mL×3) and the combined organic extracts were washed with brine (10 mL), dried over MgSO₄, filtered and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 5:1) of the residue gave a yellow oil (2.49 g, 9.4 mmol, 98%) as the product; **3g**: ¹H NMR (400 MHz, CDCl₃) δ 7.26 (t, J = 2.8 Hz, 1H), 5.34 (s, 1H), 2.43-2.40 (m, 5H), 2.03-1.97 (m, 2H), 0.89 (s, 3H), 0.15 (s, 3H), 0.10 (s, 1H); 13 C NMR (100 MHz, CDCl₃) δ 197.2, 146.1, 139.1, 83.9, 72.5, 59.0, 38.3, 25.7, 25.7, 25.7, 22.6, 18.2, -3.6, -4.8, -5.2; IR (neat, cm⁻¹): 3305, 2957, 2920, 2870, 1680, 1470, 1378, 1260, 1067, 844, 771; HRMS (ESI/[M+H]⁺) calcd. for $C_{15}H_{25}O_2Si$: 265.1624, found 265.1631.

General procedures for the DA/carbocyclization cascade cyclization reactions

To a stirred solution of **3** (10 mmol) in CH_2Cl_2 (100 mL) was added the appropriate Lewis acid (15 mmol) at room temperature. The mixture was stirred at room temperature for 30 minutes and then treated with silyl enol ether **4** (20 mmol). The reaction mixture was stirred for 12 hours at room temperature, and then quenched by a saturated NaHCO₃ aqueous solution, extracted with CH_2Cl_2 (50 mL×3). The combined organic extracts were washed with brine, dried over Na_2SO_4 , filtered and concentrated. The residue was purified by silica gel flash column chromatography (hexanes/ethyl acetate = 10:1).

8a-(Prop-2-yn-1-yl)hexahydronaphthalene-1,6(2H,7H)-dione (5b)

The general procedures for the DA/carbocyclization cascade cyclization reaction were followed with Et₂AlCl or M₂AlCl as the Lewis acid. Base on TLC analysis, both **5a** and **5b** were formed under the reaction condition, and **5b** (a white solid, 50-60%) was obtained as the major side-product after work up. **5b**: mp = 110-111 °C, 1 H NMR (300 MHz, CDCl₃) 2.68-2.63 (m, 3H), 2.55-2.37 (m, 4H), 2.32-2.29 (m, 3H), 2.06 (s, 1H),

2.01-1.93 (m, 3H), 1.68-1.53 (m, 2H); 13 C NMR (75 MHz, CDCl₃) δ 211.6, 210.4, 79.0, 72.1, 51.4, 43.3, 42.6, 38.0, 37.6, 31.0, 26.4, 25.7, 22.8; IR (neat, cm⁻¹): 3292, 2952, 2927, 2869, 1718, 1706, 1458, 1436; HRMS (ESI/[M+Na]⁺) calcd. for $C_{13}H_{16}O_2Na^+$: 227.1048, found 227.1044. When the above reaction mixture was treated with ZnBr₂ (1. 1 equiv) and was allowed to stirred at room temperature for 30 minutes, cyclized product **6a** (40-76%) was obtained.

2-(2-Oxopropyl)cyclohex-2-enone (7)

The general procedures for the DA/carbocyclization cascade cyclization reaction were followed with InCl₃, InBr₃ or In(OTf)₃ as the Lewis acid. Compound **7** (a colorless oil, 60-90%) was obtained as the major side-product after aqueous work up and silica gel flash column chromatography (hexanes/ethyl acetate = 20:1). **7**: 1 H NMR (300 MHz, CDCl₃) δ 6.82 (t, 1H, J = 4.1 Hz), 3.27 (s, 2H), 2.47 (dd, 2H, J = 2.9, 6.5 Hz), 2.45-2.38 (m, 2H), 2.20 (s, 3H), 2.10-1.98 (m, 2H); 13 C NMR (75 MHz, CDCl₃): δ 206.0, 198.5, 148.5, 134.0, 44.1, 37.8, 29.9, 26.0, 22.9; HRMS (ESI/[M⁺H]⁺) calcd. for C₉H₁₃O₂: 153.0910, found153.0911.

For synthesis of **6a-j**, the general procedures for the DA/carbocyclization cascade cyclization reaction were followed with ZnBr₂ as the Lewis acid.

6-Methylenehexahydro-4a,7-methanobenzo[7]**annulene-4,8**(1*H*,5*H*)**-dione** (**6a**) (a white solid, 1.88 g, 8.6 mmol, 86% from **3a** and **4a**, a single diastereomer): mp = 80.0-80.6 °C, 1 H NMR (400 MHz, CDCl₃) δ 5.07 (t, J = 2.4 Hz, 1H), 5.00 (s, 1H), 3.40

(td, J = 17.6, 2.8 Hz, 1H), 3.32 (d, J = 5.2 Hz, 1H), 2.81 (dd, J = 16.0, 8.8 Hz, 1H), 2.48-2.26 (m, 5H), 2.11-2.04(m, 2H), 1.91-1.81 (m, 2H), 1.77-1.65 (m, 2H); ¹³C NMR (125 MHz, CDCl₃) δ 210.9, 207.5, 146.4, 109.4, 60.2, 57.3, 45.4, 41.3, 39.0, 37.5, 37.1, 29.6, 25.79; IR (neat, cm⁻¹): 2939, 2866, 1710, 1655, 1421, 1320, 1216, 1189, 1137, 896; HRMS (ESI/[M+H]⁺) calcd. for C₁₃H₁₇O₂: 205.1229, found 205.1233.

3-Methyl-6-methylenehexahydro-4a,7-methanobenzo[7]annulene-**4,8**(1*H*,5*H*)-dio ne (6b) (a white solid, 1.77 g, 8.1 mmol, 81% from 3b and 4a, dr = 8:1), major diastereomer: mp = 116.2-117.2 °C, 1 H NMR (400 MHz, CDCl₃) δ 5.07 (d, J = 2.0 Hz, 1H), 5.01 (s, 1H), 3.40 (td, J = 17.8, 2.6 Hz, 1H), 3.34 (d, J = 5.0 Hz, 1H), 2.81 (dd, J = 16.4, 8.6 Hz, 1H), 2.54 (td, J = 12.6, 6.2 Hz, 1H), 2.45-2.33 (m, 2H), 2.27 (dddd, J = 10.0, 8.4, 4.0, 2.0 Hz, 1H), 2.14-2.02 (m, 2H), 1.91-1.86 (m, 2H), 1.68 (ddd, J = 14.0, 6.8, 3.8 Hz, 1H), 1.60-1.52 (m, 1H), 1.42 (dq, J = 13.2, 4.0 Hz, 1H); 13 C NMR (125 MHz, CDCl₃) δ 212.1, 207.6, 146.3, 109.3, 60.2, 57.2, 46.2, 41.9, 41.3, 37.6, 37.0, 35.1, 29.7, 14.6; IR (neat, cm⁻¹): 2957, 2939, 2872, 1707, 1652, 1472, 1223, 1162, 914; HRMS (ESI/[M+H] $^{+}$) calcd. for C₁₄H₁₉O₂: 219.1385, found 219.1381.

2-Methyl-6-methylenehexahydro-4a,7-methanobenzo[7]annulene-**4,8**(1*H*,5*H*)-dio ne (6c) (a white solid, 1.92 g, 8.8 mmol, 88% from 3c and 4a, a single diastereoisomer): mp = 118.8-119.7 °C, 1 H NMR (400 MHz, CDCl₃) δ 5.05 (s, 1H), 4.99 (s, 1H), 3.36-3.30 (m, 2H), 2.79 (dd, J = 16.4, 8.6 Hz, 1H), 2.64 (dd, J = 13.8, 6.0 Hz, 1H), 2.56-2.27 (m, 4H), 2.16 (d, J = 13.8 Hz, 1H), 2.12-1.92 (m, 2H), 1.87 (dd, J = 11.6, 4.5 Hz, 1H), 1.49 (d, J = 14.1 Hz, 1H), 1.00 (dd, J = 18.8, 6.9 Hz, 3H); 13 C NMR (100 MHz, CDCl₃) δ 211.2, 207.8, 146.2, 109.4, 59.8, 56.9, 45.1, 40.8, 39.7, 37.4,

36.8, 35.3, 30.0, 19.1; IR (neat, cm⁻¹): 2970, 2921, 2884, 1704, 1655, 1469, 1433, 1381, 1317, 1231, 1182, 1146, 938; HRMS (ESI/[M+H]⁺) calcd. for C₁₄H₁₉O₂: 219.1385, found 219.1393.

1-Methyl-6-methylenehexahydro-4a,7-methanobenzo[7]annulene-4,8(1*H*,5*H*)-dio ne (6d) (a white solid, 1.86 g, 8.5 mmol, 85% from 3d and 4a, dr = 16:1), major diastereomer: mp = 74.1-75.2°C, 1 H NMR (400 MHz, CDCl₃) δ 5.05 (s, 1H), 4.98 (s, 1H), 3.40 (dd, J = 18.0, 2.0 Hz, 1H), 3.30 (d, J = 4.6 Hz, 1H), 2.65 (dd, J = 16.6, 8.0 Hz, 1H), 2.53 (dt, J = 14.1, 6.0 Hz, 1H), 2.40-2.25 (m, 4H), 2.05 (ddd, J = 13.1, 5.6, 3.2 Hz, 1H), 1.99-1.80 (m, 3H), 1.51-1.36 (m, 1H), 1.02 (dd, J = 22.4, 8.6 Hz, 3H); 13 C NMR (100 MHz, CDCl₃) δ 211.0, 207.8, 146.4, 109.2, 59.8, 56.6, 51.9, 38.9, 38.0, 37.9, 37.4, 34.8, 31.9, 19.5; IR (neat, cm⁻¹): 2964, 2933, 2884, 1710, 1655, 1460, 1435, 1326, 1173, 1000, 896; HRMS (ESI/[M+H]⁺) calcd. for C₁₄H₁₉O₂: 219.1385, found 219.1392.

9a-Methyl-6-methylenehexahydro-4a,7-methanobenzo[7]annulene-**4,8**(1*H*,5*H*)-**di one** (**6e**) (a white solid, 1.75 g, 8.0 mmol, 80% from **3e** and **4a** (with 2 additional equiv of **4a** and stirring for 24 hours), a single diastereomer): mp =117.4-118.2 °C, 1 H NMR (400 MHz, CDCl₃, δ 5.02 (s, 1H), 4.99 (s, 1H), 3.32 (d, J = 4.7 Hz, 1H), 3.06 (dd, J = 18.4, 2.6 Hz, 1H), 2.69-2.39 (m, 4H), 2.32 (ddd, J = 14.2, 3.4, 1.6 Hz, 1H), 2.19 (dt, J = 13.6, 5.2 Hz, 1H), 2.06 (d, J = 12.0 Hz, 1H), 2.00-1.89 (m, 3H), 1.37 (dd, J = 14.0, 2.0 Hz, 1H), 1.03 (s, 3H); 13 C NMR (100 MHz, CDCl₃) δ 211.5, 207.6, 146.7, 108.9, 61.1, 58.8, 50.1, 43.9, 39.0, 37.9, 34.1, 33.0, 22.8, 22.2; IR (neat, cm $^{-1}$): 2970, 2933, 2866, 1713, 1698, 1655, 1454, 1436, 1420, 1323, 1262, 1158, 1061, 893, 747; HRMS

 $(ESI/[M+H]^{+})$ calcd. for $C_{14}H_{19}O_{2}$: 219.1385, found 219.1389.

1,1-Dimethyl-6-methylenehexahydro-4a,7-methanobenzo[7]annulene-4,8(1H,5H) -dione (6f) (a white solid, 1.86 g, 8.0 mmol, 80% from **3f** and **4a** (with 2 additional equiv of **4a** and stirring for 24 hours, a single diastereomer): mp = 39.6-40.7 °C, 1 H NMR (400 MHz, CDCl₃) δ 5.08 (d, J = 1.2 Hz, 1H), 4.97 (s, 1H), 3.28 (d, J = 4.8 Hz, 1H), 3.14 (td, J = 17.2, 3.0 Hz, 1H), 2.67-2.47 (m, 2H), 2.42-2.32 (m, 1H), 2.29-2.23 (m, 3H), 2.00-1.93 (m, 2H), 1.90-1.68 (m, 2H), 1.00 (s, 3H), 0.94 (s, 3H); 13 C NMR (100 MHz, CDCl₃) δ 212.3, 208.6, 145.8, 109.9, 58.5, 55.1, 51.4, 43.0, 38.3, 37.2, 36.8, 35.8, 34.1, 30.7, 20.8; IR (neat, cm⁻¹): 2970, 2884, 1710, 1659, 1469, 1439, 1226, 1180, 1152, 887; HRMS (ESI/[M+H]⁺) calcd. for C₁₅H₂₁O₂: 233.1542, found 233.1532.

5-((*tert*-Butyldimethylsilyl)oxy)-6-methylenehexahydro-4a,7-methanobenzo[7]an nulene-4,8(1*H*,5*H*)-dione (6g) (an off-white amorphous solid, 2.5 g, 7.5 mmol, 75% from 3g and 4a, dr = 7:1), major diastereomer: 1 H NMR (400 MHz, CDCl₃) δ 5.33 (d, J = 2.0 Hz, 1H), 5.19 (s, 1H), 5.14 (dd, J = 2.8, 0.8 Hz, 1H), 3.25 (d, J = 4.8 Hz, 1H), 3.05 (dd, J = 16.4, 8.8 Hz, 1H), 2.74-2.70 (m, 1H), 2.43-2.28 (m, 3H), 2.07-1.98 (m, 2H), 1.86-1.64 (m, 4H), 0.90 (s, 9H), 0.24 (s, 3H), 0.07 (s, 3H); 13 C NMR (100 MHz, CDCl₃) δ 210.4, 208.4, 150.5, 110.8, 74.3, 59.9, 41.6, 39.1, 36.6, 34.4, 29.6, 29.0, 25.8, 24.7, 18.0, -4.2, -4.9; IR (neat, cm⁻¹): 2958, 2939, 2866, 1707, 1475, 1250, 1140, 1122, 1094, 865, 838, 777; HRMS (ESI/[M+H]⁺) calcd. for C₁₉H₃₁O₃Si: 335.2042, found 335.2049.

4-Methylenehexahydro-1H-3,5a-methanoheptalene-2,6(3H,7H)-dione (6h) (an

off-white amorphous solid, 1.79 g, 8.2 mmol, 82% from **3h** and **4a**, a single diastereomer): 1 H NMR (400 MHz, CDCl₃) δ 5.08 (d, J = 1.4 Hz, 1H), 4.93 (s, 1H), 3.23 (d, J = 4.8 Hz, 1H), 2.87-2.60 (m, 2H), 2.55 (s, 2H), 2.48-2.44 (m, 1H), 2.41-2.18 (m, 2H), 2.14-1.72 (m, 4H), 1.68-1.27 (m, 4H); 13 C NMR (100 MHz, CDCl₃) δ 213.8, 208.4, 145.4, 110.1, 58.3, 58.0, 43.9, 43.5, 41.9, 41.2, 35.0, 33.2, 28.7, 25.7; IR (neat, cm⁻¹): 2933, 2866, 1704, 1655, 1451, 1332, 1219, 1173, 1651, 914, 890; HRMS (ESI/[M+H]⁺) calcd. for $C_{14}H_{19}O_{2}$: 219.1385, found 219.1392.

10,10-Dimethyl-6-methylenehexahydro-4a,7-methanobenzo[7]annulene-4,8(1*H*,5 *H*)-dione (6i) (a white solid, 1.84 g, 7.9 mmol, 79% from 3a and 4b, a single diastereomer): mp = 74.8-76.5°C, 1 H NMR (400 MHz, CDCl₃) δ 5.07 (t, J = 2.2 Hz, 1H), 4.99 (s, 1H), 3.73 (td, J = 18.0, 2.8 Hz 1H), 2.95-2.81 (m, 2H), 2.61-2.47 (m, 1H), 2.33 (ddd, J = 14.6, 10.2, 4.7 Hz, 2H), 2.17 (dd, J = 18.3, 3.4 Hz, 2H), 2.11-1.93 (m, 2H), 1.76-1.61 (m, 2H), 1.26 (s, 3H), 0.82 (s, 3H); 13 C NMR (100 MHz, CDCl₃) δ 210.1, 208.3, 144.6, 110.4, 72.4, 60.7, 46.6, 45.7, 41.6, 41.1, 40.2, 31.9, 25.6, 25.1, 24.3; IR (neat, cm⁻¹): 2957, 2872, 1692, 1652, 1460, 1262, 1222, 1173, 890; HRMS (ESI/[M+H]⁺) calcd. for C₁₅H₂₁O₂: 233.1542, found 233.1525.

7-Methyl-6-methylenehexahydro-4a,7-methanobenzo[**7**]annulene-**4,8**(**1***H*,**5***H*)-dio **ne** (**6j**) (a white solid, mp = 76.6-77.6 °C, 1.99 g, 9.1 mmol, 91% from **3a** and **4c**, a single diastereomer): 1 H NMR (400 MHz, CDCl₃) δ 5.02 (s, 1H), 4.89 (t, J = 2.4 Hz, 1H), 3.53 (td, J = 17.8, 2.8 Hz, 1H), 2.82 (dd, J = 16.4, 8.6 Hz, 1H), 2.53-2.25 (m, 5H), 2.18-2.02 (m, 2H), 1.94-1.79 (m, 1H), 1.79-1.65 (m, 3H), 1.21 (s, 3H); 13 C NMR (100 MHz, CDCl₃) δ 211.0, 208.3, 151.0, 107.7, 59.1, 55.4, 45.7, 44.1, 41.8, 38.9, 38.8,

29.4, 25.7, 16.5; IR (neat, cm⁻¹): 2933, 2866, 1707, 1652, 1433, 1323, 1253, 1210, 1146, 1058, 890; HRMS (ESI/[M+H]⁺) calcd. for C₁₄H₁₉O₂: 219.1385, found 219.1376.

6-Methylene-1,2,5,6,7,9a-hexahydro-4a,7-methanobenzo[7]annulene-4,8-diyl)bis(oxy))bis(trimethylsilane) (18a)

To a solution of **6a** (10.2 g, 50 mmol), hexamethyldisilazane (42 mL, 200 mmol), and NaI (22.5g, 150 mmol) in CH₃CN (50mL) was added TMSCI (1.87 g, 27.4 mmol) at room temperature. The reaction mixture was stirred for 1 hour, and then diluted with hexanes (250 mL), quenched by water (50mL). The aqueous layer was extracted with hexanes (100 mL×3) and the combined organic extracts were washed with brine (50 mL), dried over Na₂SO₄, filtered and concentrated to give a yellow oil as the crude product, which was used without further manipulations.

6-Methylene-1,2,5,6,7,9a-hexahydro-4a,7-methanobenzo[7]annulene-4,8-diyl)bis(oxy))bis(triethylsilane) (18b) and

6-methylene-1,2,5,6,7,9a-hexahydro-4a,7-methanobenzo[7]annulene-4,8-diyl)bis(oxy))bis(tert-butyldimethylsilane) (18c)

To a solution of 6a (2.04 g, 10 mmol) in CH_2Cl_2 (100 mL) and triethylamine (5.5 mL, 40 mmol) at 0° C was added TESOTf or TBSOTf (25 mmol). The reaction mixture was stirred at 0 °C for 1 hour, and then quenched by brine. The organic layer was separated, dried over Na_2SO_4 , filtered and concentrated. Compound 18b was used

without further manipulations, and compound **18c** was purified by silica gel flash column chromatography (hexanes/ethyl acetate = 99:1 with 3% Et₃N) to give a white solid (4.33 g, 10 mmol, 100%) as the product. **18c**: mp= 75.8-76.7 °C, ¹H NMR (400 MHz, CDCl₃) δ ppm 4.87 (d, J = 4.4 Hz, 1H), 4.80 (s, 1H), 4.59 (s, 1H), 4.47 (d, J = 4.0 Hz, 1H), 2.99 (d, J = 12.8 Hz, 1H), 2.67 (d, J = 4.4 Hz, 1H), 2.16-1.94 (m, 4H), 1.772 (dd, J = 10.4, 4.4 Hz, 1H), 1.60-1.53 (m, 2H), 1.39-1.28 (m, 2H), 0.94 (s, 9H), 0.92 (s, 9H), 0.19 (s, 3H), 0.16 (s, 3H), 0.14 (s, 3H), 0.12 (s, 3H); 13 C NMR (100 MHz, CDCl₃) δ = 155.3, 154.8, 152.9, 104.3, 103.3, 101.8, 50.4, 46.6, 44.7, 40.2, 35.9, 28.5, 25.74, 25.6, 24.1, 18.2, 17.9, -4.1, -4.3, -4.9, -5.0; IR (neat, cm⁻¹): 2964, 2933, 2866, 1662, 1470, 1348, 1253, 1198, 1171, 1088, 1040, 1006, 890, 832, 777; HRMS (ESI/[M+H] $^+$) calcd. for C₂₅H₄₅O₂Si₂: 433.2958, found 433.2974.

3-Hydroxy-6-methylenehexahydro-4a,7-methanobenzo[7]annulene-4,8(1*H*,5*H*)-d ione (19)

To a solution of **18c** (10.8 g, 25 mmol), NaHCO₃ (2.1 g, 25 mmol) in CH₂Cl₂ (250 mL) and MeOH (250 mL) was added monoperoxyphthalic acid magnesium salt hexahydrate (MMPP) (6.8 g, 13.7 mmol) at room temperature. The resulting mixture was stirred for 2-4 hours. After TLC analysis showed the consumption of the starting materials, the reaction mixture was quenched by addition of a saturated Na₂S₂O₃ aqueous solution (20 mL). The aqueous layer was extracted with CH₂Cl₂ (150 mL×3) and the combined organic extracts were washed with a 2 N HCl aqueous solution, a saturated NaHCO₃ aqueous solution, and brine and then concentrated. Silica gel flash

column chromatography (hexanes/ethyl acetate = 2:1) of the residue gave a white solid (4.40 g, 20.0 mmol, 90%) as the product. **19**: mp = 138.8-138.9 °C, ¹H NMR (400 MHz, CDCl₃) δ 5.11 (t, J = 2.0 Hz, 1H), 5.05 (s, 1H), 4.30 (m, 1H), 3.59 (d, J = 3.2 Hz, 1H), 3.42 (td, J = 18.0, 2.8 Hz, 1H), 3.37 (d, J = 5.2 Hz, 1H), 2.79 (dd, J = 16.8, 8.8 Hz, 1H), 2.49-2.42 (m, 2H), 2.37-2.26 (m, 2H), 2.10 (d, J = 8.4 Hz, 1H), 1.96-1.87 (m, 1H), 1.76-1.71 (m, 1H), 1.61-1.54 (m, 1H); ¹³C NMR (100 MHz, CDCl₃) δ 211.1, 206.6, 144.8, 110.1, 72.7, 59.8, 55.9, 45.8, 40.7, 37.4, 36.6, 35.4, 27.4; IR (neat, cm⁻¹): 3391, 2939, 1716, 1695, 1439, 1104, 976, 899, 865; HRMS (ESI/[M+H]⁺) calcd. for $C_{13}H_{17}O_3$: 221.1178, found 221.1180.

6-Methylene-6,7,9,9a-tetrahydro-4a,7-methanobenzo
[7]annulene-4,8(1H,5H)-dio ne (12)

To a stirred solution of **19** (6.60 g, 30.0 mmol) in THF (600 mL) was added NaBH₄ (0.39 g, 10.5 mmol) slowly in portions at -78 °C. The resulting mixture was stirred at -78 °C for 30 minutes and then warmed to -20 °C slowly. After TLC showed consumption of **19**, the reaction was quenched by addition of a saturated NH₄Cl aqueous solution (50 mL) at -20 °C. The aqueous phase was extracted with ethyl acetate (300 mL×3), and the combined organic extracts were washed with brine (50 mL×2), dried over MgSO₄, filtered and concentrated to give a pale yellow oil as the crude product (a mixture of diol diastereomers), which was used without further manipulations. To a solution of the crude product (6.60 g, 30.0 mmol) in toluene (600 mL) was added triphenylphosphine (31.4 g, 120 mmol), imidazole (8.2 g, 120 mmol)

and iodine (22.9 g, 90 mmol). The mixture was heated under reflux for 5 hour. After cooling to room temperature, the reaction mixture was diluted with ethyl acetate (500 mL) and washed successively with a 10% sodium thiosulfate aqueous solution, a saturated NaHCO₃ aqueous solution, brine and dried over MgSO₄. After removal of the volatiles, silica gel flash column chromatography (hexanes/ ethyl acetate = 20:1) of the residue gave (4.2 g, 22 mmol, 75%) a colorless oil as the product. **12**: 1 H NMR (400 MHz, CDCl₃) δ 5.67 (td, J = 10.0, 4.4 Hz, 1H), 5.46 (td, J = 8.0, 2.0 Hz, 1H), 5.01 (s, 1H), 4.93 (s, 1H), 3.19 (s, 1H), 2.84 (dd, J = 17.2, 8.0 Hz, 1H), 2.52-2.41 (m, 1H), 2.07-1.83 (m, 6H), 1.62-1.58 (m, 2H); 13 C NMR (75 MHz, CDCl₃) δ 209.8, 148.3, 132.9, 127.6, 108.7, 59.3, 45.7, 43.9, 42.0, 40.5, 39.6, 28.3, 25.5; IR (neat, cm⁻¹): 2957, 2933, 2897, 2866, 1723, 1473, 1259, 1070, 1006, 838, 783; HRMS (ESI/[M+H] $^{+}$) calcd. for C₁₃H₁₇O: 189.1279, found 189.1269.

9-Hydroxy-6-methylene-1,2,6,7,9,9a-hexahydro-4a,7-methanobenzo[7]annulen-8(5*H*)-one (20) and

8-hydroxy-6-methylene-1,5,6,7,8,9a-hexahydro-4a,7-methanobenzo[7]annulen-9(2H)-one (22)

To a solution of **12** (3.76 g, 20 mmol) in CH_2Cl_2 (100 mL) and triethylamine (11 mL, 80 mmol) at 0 °C was added TBSOTf (11.4 mL, 30 mmol). The reaction mixture was stirred at 0 °C for 1 hour. The mixture was quenched by brine, separated, and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 99:1 with 5% Et_3N) of the residue gave a yellow oil as the crude product, which was used

without further manipulations. To a solution of the crude silyl enol ether in CH₂Cl₂ (200 mL) and MeOH (100 mL) with NaHCO₃ (3.36, 40 mmol) at room temperature was added MMPP (5.94 g, 12 mmol). After stirring at room temperature for 2-4 hours, then reaction mixture was quenched by addition of a saturated Na₂S₂O₃ aqueous solution (10 mL). The aqueous layer was extracted with CH₂Cl₂ (300 mL×3) and the combined organic extracts were washed with brine and then concentrated. The residue was then dissolved in THF (100 mL) and MeOH (10 mL), and was treated with a 2 M aqueous HCl solution (100 mL) at room temperature. The mixture was stirred at room temperature for 2 hours and quenched by addition of a saturated NaHCO₃ aqueous solution. The aqueous layer was extracted with diethyl ether (200 mL×3) and the combined organic extracts were washed with brine (50 mL), dried over Na₂SO₄, filtered and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 9:1) of the residue gave a yellow oil (3.45 g, 16.9 mmol, 85%) as the product. **20**: ¹H NMR (400 MHz, CDCl₃) δ 5.70 (m, 1H), 5.48 (td, J = 9.6, 2.0 Hz, 1H), 5.05 (t, J = 2.0 Hz, 1H), 4.96 (s, 1H), 4.58 (d, J = 8.8 Hz, 1H), 3.35 (d, J = 4.8 Hz, 1H),3.21 (s, 1H), 2.62-2.47 (m, 3H), 2.10-2.02 (m, 3H), 1.95-1.84 (m, 2H), 1.11-1.03 (m, 1H); ¹³C NMR (100 MHz, CDCl₃) δ 210.8, 147.7, 132.0, 128.4, 109.2, 71.7, 56.5, 49.5, 44.9, 44.8, 42.0, 25.3, 18.3; IR (neat, cm⁻¹): 3433, 2921, 1716, 1442, 1226, 899, 734, 704; HRMS (ESI/[M+H]⁺) calcd. for $C_{13}H_{17}O_2$: 205.1229, found 205.1240. When the above reaction mixture was stirred in the HCl/THF/methanol mixture for 24 hours, and then quenched by saturated aqueous NaHCO₃ solution. Another yellow oil (3.45 g, 16.9 mmol, 85%) was obtained as the product using the same work-up

procedures. **22**: ¹H NMR (300 MHz, CDCl₃) δ 5.73 (td, J = 12.0, 3.0 Hz, 1H), 5.50 (td, J = 12.0, 3.0 Hz, 1H), 5.09 (t, J = 1.5 Hz,1H), 4.95 (s, 1H), 4.24 (t, J = 3.0 Hz, 1H), 3.61 (d, J = 3.0 Hz, 1H), 2.94 (t, J = 3.0 Hz, 1H), 2.44-2.34 (m, 2H), 2.22-2.12 (m, 3H), 2.06-2.01 (m, 1H), 1.95-1.88 (m, 1H), 1.85-1.77 (m, 1H); ¹³C NMR (100 MHz, CDCl₃) δ 213.9, 146.4, 132.3, 127.5, 110.8, 78.1, 55.9, 48.2, 46.4, 45.8, 40.1, 25.3, 24.1; IR (neat, cm⁻¹): 3482, 2933, 1704, 1436, 1381, 1088, 884, 701; HRMS (ESI/[M+H]⁺) calcd. for C₁₃H₁₇O₂: 205.1229, found 205.1237.

6-Methylene-9-oxo-1,2,5,6,7,8,9,9a-octahydro-4a,7-methanobenzo[7]annulen-8-yl acetate (23)

To a solution of **22** (2.04 g, 10 mmol) in CH₂Cl₂ (100 mL) with triethylamine (5.6 mL, 40 mmol) at room temperature was added acid anhydride (1.8 mL, 20 mmol). The reaction mixture was stirred at room temperature for 1 hour and quenched with saturated NaHCO₃ aqueous solution (30 mL). The aqueous layer was extracted by diethyl ether (50 mL×3) and the combined organic extracts were washed with brine, dried over MgSO₄, filtered and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 9:1) of the residue afford a colorless oil (2.33 g, 9.5 mmol, 95%) as the product. **23**: ¹H NMR (400 MHz, CDCl₃) δ 5.74 (td, J = 10.0, 2.8 Hz, 1H), 5.49 (td, J = 10.0, 2.8 Hz, 1H), 5.31 (d, J = 3.6 Hz, 1H), 5.11 (s, 1H), 5.04 (s, 1H), 2.93 (t, J = 4.6 Hz, 1H), 2.44-2.38 (m, 2H), 2.28 (d, J = 16.8 Hz, 1H), 2.18 (s, 3H), 2.17-2.06 (m, 3H), 1.99-1.94 (m, 1H), 1.85-1.77 (m, 2H); ¹³C NMR (100 MHz, CDCl₃) δ 207.1, 170.1, 146.5, 132.0, 127.8, 111.6, 78.4, 56.9, 46.4, 45.8, 44.9, 40.2,

25.3, 24.4, 20.7; IR (neat, cm⁻¹): 2933, 2860, 1750, 1726, 1432, 1375, 1235, 1070, 1043, 1024, 738, 710; HRMS (ESI/[M+H]⁺) calcd. for C₁₅H₁₉O₃: 247.1334, found 247.1316.

6-Methylene-1,5,6,7,8,9a-hexahydro-4a,7-methanobenzo[7]annulen-9(2*H*)-one (11)

To a stirred solution of **23** (1.23 g, 5 mmol) in THF (degassed, 67 mL) and MeOH (33 mL) at 0 °C was added SmI₂ (a 0.1 M solution in THF, 110 mL). The resulting mixture was stirred at 0 °C for 20 minutes, and was quenched with water (100 mL) and extracted with diethyl ether (100 mL×3). The combined organic extracts were dried over MgSO₄, filtered and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 20:1) of the residue afforded a yellow oil (0.89 g, 4.7 mmol, 95%) as the product. **11**: 1 H NMR (400 MHz, CDCl₃) δ 5.73 (td, J =10.8, 2.8 Hz, 1H), 5.47 (td, J = 10.0, 2.4 Hz, 1H), 4.97 (s,1H), 5.11 (s, 1H), 4.93 (s, 1H), 2.90 (d, J = 3.6 Hz, 1H), 2.54-2.23 (m, 4/H), 2.15-2.11 (m, 2H), 1.86-1.68 (m, 4H); 13 C NMR (100 MHz, CDCl₃) δ 214.8, 152.8, 133.3, 127.4, 108.3, 56.9, 49.8, 46.9, 44.2, 40.7, 40.6, 25.5, 25.0; IR (neat, cm⁻¹): 2933, 1735, 1646, 1433, 1366, 1247, 1037, 874, 698; HRMS (ESI/[M+H]⁺) calcd. for C₁₅H₁₉O₃: 247.1334, found 247.1316; HRMS (ESI/[M+H]⁺) calcd. for C₁₅H₁₉O₃: 247.1334, found 247.1316; HRMS

8-Methyl-3,4,4a,5,6,7,8,9-octahydro-5,8-epoxy-7,9a-methanobenzo[7]annulene (10, Snider's intermediate)

To a stirred solution of 11 (564 mg, 3 mmol) in CH₂Cl₂ (50 mL) was added K-selectride (a 1.0 M solution in THF, 18 mL, 18 mmol) at -78 °C and the reaction mixture was allowed to warm up to 0 °C and stirred for 1.5 hours. The reaction was then quenched with a saturated NH₄Cl aqueous solution (10 mL). The aqueous layer was extracted with CH₂Cl₂ (50 mL×2). The combined organic extracts were dried over Na₂SO₄, filtered, and concentrated to give a yellow oil as the crude alcohol product, which was used without further manipulations. To a stirred solution of the crude alcohol product (570 mg, 3 mmol) in CH₂Cl₂ (10 mL) was added trifluoroacetic acid (10 mL) at 0 °C and the mixture was stirred at the same temperature for 30 minutes. The reaction was quenched with saturated aqueous NaHCO₃ (30 mL) at 0 °C. The aqueous layer was extracted with CH₂Cl₂ (50 mL×2). The combined organic extracts were dried over Na₂SO₄, filtered, and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 30:1) of the residue afforded a colorless oil (484 mg, 85%) as the product. **Snider's intermediate 10**: ¹H NMR (400 MHz, CDCl₃) δ 5.60 (td, J = 10.8, 3.6 Hz, 1H), 5.33 (td, J = 10.0, 2.0 Hz, 1H), 4.14 (d, J = 6.8 Hz, 1H), 2.15-2.09 (m, 3H), 1.91-1.74 (m, 4H), 1.58-1.42 (m, 5H), 1.39 (s, 3H); ¹³C NMR $(100 \text{ MHz}, \text{CDCl3}) \delta = 133.13, 126.7, 86.7, 80.6, 52.6, 45.5, 44.8, 44.6, 43.5, 38.3,$ 26.2, 23.3, 22.2; IR (neat, cm⁻¹): 2941, 2865, 1709, 1473, 1447, 1377, 1326, 1090, 997, 823; HRMS (ESI/[M+H] $^+$) calcd. for $C_{13}H_{19}O$: 191.1436, found 191.1433.

3-Bromo-6-methylenehexahydro-4a,7-methanobenzo
[7]annulene-4,8(1H,5H)-dio ne (24)

To a solution of **18c** (4.32 g, 10 mmol) in THF (200 mL) was added NBS (1.96 g, 11 mmol) at 0 °C. The mixture was stirred until TLC analysis showed the consumption of the starting material (about 2 hours). The mixture was then quenched with a 2 N HCl aqueous solution. The aqueous layer was extracted with diethyl ether (200 mL x 3), and the combined organic extracts were washed with a saturated NaHCO₃ aqueous solution, brine, dried over Na₂SO₄, filtered and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 10:1) of the residue gave a white solid (2.52) g, 9 mmol, 90%) as the product. **24**: mp = 75.8-76.7 °C, ¹H NMR (400 MHz, $CDCl_3$) δ 5.11 (s, 1H), 5.06 (s, 1H), 4.80 (dd, J = 13.2, 6.0 Hz, 0.5H), 4.66 (dd, J = 13.2) 12.8, 6.0 Hz, 0.5H), 3.49-3.43 (m, 1H), 3.38 (d, J = 5.2 Hz, 1H), 2.82 (dd, J = 16.8, 8.8 Hz, 1H), 2.69-2.64 (m, 1H), 2.59-2.52 (m, 1H), 2.43 (d, J = 3.6 Hz, 1H), 2.39-2.34 (m, 2H), 2.18-1.95 (m, 4H), 1.84-1.57 (m, 1H); ¹³C NMR (100 MHz, CDCl₃) δ 206.4, 206.4, 201.8, 201.2, 144.9, 144.8, 110.1, 110.0, 62.0, 59.8, 59.8, 57.5, 57.4, 53.8, 45.2, 45.1, 40.6, 38.3, 38.0, 38.0, 37.3, 36.6, 36.5, 30.5, 29.4; IR (neat, cm⁻¹): 2945, 2870, 1713, 1655, 1423, 1322, 1224, 1190, 1140, 895; HRMS (ESI/[M+H]⁺) calcd. for C₁₃H₁₆O₂Br: 283.0334, found 283.0370.

6-Methylene-6,7,9,9a-tetrahydro-4a,7-methanobenzo[7]annulene-4,8(1*H*,5*H*)-dio ne (15)

Procedures with 24 as the starting material: To a stirred solution of **24** (1.41 g, 0.5 mmol) in DMF (5 mL) was added LiBr (0.26 g, 3 mmol) and Li₂CO₃ (0.22 g, 3 mmol). The resulting mixture was stirred at 120 °C until TLC analysis showed

consumption of the starting material (about 2 hours). The mixture was then poured into cool water (10 mL), and the precipitate was collected by filtration. Silica gel flash column chromatography (nhexanes/EtOAc = 4:1) of the precipitate afforded an amorphous solid (71 mg, 70%) as the product. 15: ¹H NMR (400 MHz, CDCl₃) δ ppm 6.89 (td, J = 10.0, 4.0 Hz, 1H), 6.20-6.02 (d, J = 10.8 Hz, 1H), 5.11 (s, 1H), 5.03 (s, 1H),3.58 (td, J = 17.6, 2.8 Hz, 1H), 3.35 (d, J = 5.0 Hz, 1H), 2.84 (dd, J = 16.0, 8.0 Hz, 1H), 2.63 (dd, J = 16.0, 8.0 Hz, 1H), 2.50-2.29 (m, 1H), 2.22 (dd, J = 12.0, 1.6 Hz, 1H), 2.06(d, J = 16.0 Hz, 1H), 1.83-1.87 (m, 1H); ¹³C NMR (100 MHz, CDCl₃) $\delta = 207.5$, 199.2, 147.5, 146.4, 129.2, 109.2, 59.8, 53.0, 40.6, 40.4, 37.4, 35.9, 30.5; IR (neat, cm⁻¹): 2951, 2914, 2855, 1710, 1670, 1418, 1387, 1311, 1219, 1183, 899, 801; HRMS $(ESI/[M+H]^{+})$ calcd. for $C_{13}H_{15}O_{2}$: 203.1072, found 203.1061. General procedures with 6a as the starting material: To a stirred 0.2 M solution of 6a in DMSO or ethyl acetate was added IBX (2-4 equiv). The solution was stirred at 80 °C until TLC analysis showed the consumption of starting material. The reaction mixture was cooled to room temperature and diluted with diethyl ether. The organic layer was washed with a 5% NaHCO₃ aqueous solution, water, brine, and then dried over MgSO₄, filtered and concentrated. Silica gel column chromatography (nhexanes/EtOAc = 4:1) of the residue afforded an amorphous solid (30-40%) as the product. General procedures with 18a-c as the starting material: To the crude **18a-c** was added a 1:1 IBX/NMO (2-10 equiv) solution in DMSO (0.2 M for **18a-c**) in one portion at ambient temperature. The mixture was stirred at 45 °C until TLC analysis showed consumption of the starting material. The reaction mixture was then

diluted with a 5% NaHCO₃ aqueous solution and extracted with diethyl ether (\times 3). The combined organic extracts was filtered through a pad of celite and washed with saturated aqueous NaHCO₃ solution, water, and brine. After drying over MgSO₄ and filtration, the volatiles were removed in vacuo. Silica gel flash column chromatography (nhexanes/EtOAc = 4:1) of the residue afforded an amorphous solid (20-57%) as the product along with **6a** (10-70%) being recovered.

6-Methylene-1,4,5,6,7,8,9,9a-octahydro-4a,7-methanobenzo[7]annulene-4,8-diol (25)

To a solution of **15** (2.02 g, 10 mmol) in MeOH (100 mL) was added CeCl₃•7H₂O (3.72 g, 10 mmol) at 0°C. The reaction mixture was cooled to -78°C and treated with NaBH₄ (0.37g, 10 mmol). After stirring at -78°C for 10 minutes, the reaction mixture was concentrated. The residue was dissolved in diethyl ether (100 mL) and washed by a saturated NaHCO₃ aqueous solution (20 mL) and brine (20 mL), dried over Na₂SO₄, filtered and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 4:1) of the residue gave a colorless oil (2.00 g, 9.7 mmol, 97%) as the product. **25**: ¹H NMR (400 MHz, CDCl₃) δ ppm 5.73-5.63 (m, 1H), 5.59 (dd, J = 10.0, 2.0 Hz, 1H), 4.97 (d, J = 1.6 Hz, 2H), 4.17 (s, 1H), 3.91-3.76 (m, 1H), 2.74-2.68 (m, 2H), 2.10-1.97 (m, 3H), 1.84-1.63 (m, 4H), 1.49-1.35 (m, 3H), 1.26 (s, 2H); ¹³C NMR (100 MHz, CDCl₃) δ = 150.0, 130.7, 127.6, 106.8, 70.3, 69.0, 50.8, 46.1, 39.8, 38.0, 34.7, 29.6, 28.2; IR (neat, cm⁻¹): 3427, 2927, 2848, 1652, 1457, 1432, 1076, 1046, 871; HRMS (ESI/[M+H]⁺) calcd. for C₁₃H₁₉O₂: 207.1385, found 207.1388.

6-Methylene-1,4,5,6,7,8,9,9a-octahydro-4a,7-methanobenzo[7]annulene-4,8-diyl diacetate (26)

To a solution of **25** (1.03 g, 5 mmol) in CH₂Cl₂ (50 mL) with triethylamine (4.2 mL, 30 mmol) at room temperature was added acid anhydride (1.1 mL, 12 mmol). The reaction mixture was stirred at room temperature for 1 hour and then quenched with a saturated NaHCO₃ aqueous solution (20 mL). The aqueous layer was extracted by diethyl ether (20 mL × 3) and the combined organic extracts were washed with brine, dried over MgSO₄, filtered and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 9:1) of the residue afforded a white solid (1.44 g, 5 mmol, 99%) as the product. **26**: mp = 99.6-100.4°C, 1 H NMR (400 MHz, CDCl₃) δ 5.72 (tdd, J = 9.4, 4.4, 2.2 Hz, 1H), 5.59-5.43 (m, 1H), 5.38 (s, 1H), 5.03-4.85 (m, 3H), 2.75 (d, J = 2.8 Hz, 1H), 2.37 (td, J = 16.9, 2.4 Hz, 1H), 2.20-2.03 (m, 9H), 1.99-1.89 (m, 1H), 1.82-1.66 (m, 2H), 1.59-1.48 (m, 2H); 13 C NMR (100 MHz, CDCl₃) δ 171.0, 170.6, 148.3, 128.4, 127.0, 108.0, 72.3, 72.0, 47.0, 44.4, 39.7, 37.8, 29.9, 29.6, 29.4, 21.2, 21.1; IR (neat, cm⁻¹): 2957, 2914, 1735, 1655, 1460, 1433, 1366, 1238, 1037, 957, 884; HRMS (ESI/[M+H]⁺) calcd. for C₁₇H₂₃O₄: 291.1596, found 291.1604.

8-Hydroxy-6-methylene-5,6,7,8,9,9a-hexahydro-4a,7-methanobenzo[7]annulen-4(1*H*)-one (28)

To a solution of **25** (1.03 g, 5 mmol) in CH_2Cl_2 (50 mL) was added MnO_2 (8.7 g, 100 mmol). The reaction mixture was heated under reflux for 12 hour. After cooling to

room temperature, the mixture was filtered and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 4:1) of the residue afford a colorless oil (0.98 g, 4.8 mmol, 95%) as the product. **28**: 1 H NMR (400 MHz, CDCl₃) δ 6.88 (ddd, J = 10.0, 5.6, 2.2 Hz, 1H), 6.03 (ddd, J = 10.0, 2.8, 1.0 Hz, 1H), 5.01-5.00 (m, 2H), 3.93-3.77 (m, 1H), 3.31 (td, J = 17.4, 2.6 Hz, 1H), 2.82-2.66 (m, 1H), 2.57-2.39 (m, 1H), 2.33 (td, J = 19.5, 5.4 Hz, 1H), 2.22 (td, J = 11.8, 6.0 Hz, 1H), 2.11-1.96 (m, 1H), 1.83 (ddd, J = 19.4, 12.8, 4.0 Hz, 2H), 1.68 (d, J = 10.4 Hz, 1H), 1.67 (s, 1H), 1.42 (ddd, J = 13.8, 11.2, 6.6 Hz, 1H); 13 C NMR (100 MHz, CDCl₃) δ 201.1, 148.7, 148.0, 129.2, 107.3, 68.6, 53.2, 50.3, 39.2, 37.8, 35.1, 34.5, 30.1; IR (neat, cm⁻¹): 3494, 3055, 2988, 2927, 1735, 1671, 1372, 1268, 1247, 1049, 741, 704; HRMS (ESI/[M+H]⁺) calcd. for $C_{13}H_{17}O_2$: 205.1229, found 205.1237.

8-((*tert*-Butyldimethylsilyl)oxy)-6-methylene-5,6,7,8,9,9a-hexahydro-4a,7-methan obenzo[7]annulen-4(1*H*)-one (29)

To a stirred solution of **28** (204 mg, 1 mmol) in CH₂Cl₂ (10 mL) was added imidazole (170 mg, 2.5 mmol) and TBSCl (181 mg, 1.2 mmol). The reaction mixture was stirred at room temperature for 4 hours, and then quenched by addition of a saturated aqueous NaHCO₃ solution (10 mL). The aqueous layer was extracted with CH₂Cl₂ (10 mL×2) and the combined organic extracts were washed with brine (10 mL), dried over MgSO₄, filtered and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 10:1) of the residue gave a white solid (318 mg, 0.99 mmol, 99%) as the product. **29**: mp = 95.0-95.8 °C, ¹H NMR (400 MHz, CDCl₃) δ 6.86 (ddd,

6-((*tert*-Butyldimethylsilyl)oxy)-4-methyleneoctahydro-2a,5-methanocyclohepta[4,5]benzo[1,2-b]oxiren-2(1a*H*)-one (30)

To a solution of **29** (3.18 g, 10 mmol) in MeOH (100 mL) was added a 30% H₂O₂ aqueous solution (1.53 mL, 25 mmol) and a 6 N NaOH aqueous solution (1.86 mL, 10.5 mmol). The reaction was stirred at room temperature for 1.5 hours. Then the solution was quenched with a saturated Na₂S₂O₃ aqueous solution (50 mL). The mixture was extracted with diethyl ether (100 mL×3), washed with brine (40 mL). The organic extracts were dried over Na₂SO₄, filtered and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 9:1) of the residue afforded a white solid (3.2 g, 9.6 mmol, 96%) as the product. **30**: mp = 108.8-109.8 °C, ¹H NMR (400 MHz, CDCl₃) δ 4.96 (s, 1H), 4.94 (s, 1H), 3.73 (ddd, J = 10.8, 5.6, 3.0 Hz, 1H), 3.52 (t, J = 2.7 Hz, 1H), 3.21 (d, J = 3.6 Hz, 1H), 3.10 (td, J = 16.8, 2.6 Hz, 1H), 2.60 (s,

1H), 2.21-2.16 (m, 2H), 2.11-2.04 (m, 2H), 1.74 (dd, J = 11.6, 2.4 Hz, 1H), 1.69-1.55 (m, 1H), 1.55-1.42 (m, 1H), 0.87 (s, 9H), 0.05 (s, 3H), 0.03 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 206.9, 147.1, 108.1, 69.8, 53.7, 53.4, 53.3, 51.0, 39.3, 37.6, 33.2, 30.6, 27.51, 25.7, 18.0, -4.7, -4.7; IR (neat, cm⁻¹): 2945, 2878, 2854, 1695, 1247, 1107, 1091, 884, 832, 771; HRMS (ESI/[M+H]⁺) calcd. for C₁₉H₃₁O₃Si: 335.2042, found 335.2050.

8-((*tert*-Butyldimethylsilyl)oxy)-6-methylene-1,2,5,6,7,8,9,9a-octahydro-4a,7-meth anobenzo[7]annulen-2-ol (31)

To a solution of **30** (3 g, 9 mmol) in MeOH (80 mL) was added NH₂NH₂•H₂O (0.95 mL, 18 mmol) at 0 °C. After stirring for 15 minutes, AcOH (1.1 mL, 18 mmol) was added at 0 °C, and the resulting mixture was stirred at the same temperature for another 1.5 hours, the reaction was then quenched by a saturated NaHCO₃ aqueous solution and the mixture was extracted with diethyl ether (100 mL×2). The combined extracts were dried over Na₂SO₄, filtered and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 9:1) of the residue gave a yellow solid (2.67 g, 8.3 mmol, 93 %) as the product. **31**: mp = 86.7-87.9 °C, ¹H NMR (400 MHz, CDCl₃) δ 5.75-5.66 (m, 2H), 4.94 (d, J = 10.8 Hz, 2H), 4.13 (d, J = 4.0 Hz, 1H), 3.72 (ddd, J = 10.8, 5.8, 3.0 Hz, 1H), 2.50 (s, 1H), 2.39-2.18 (m, 2H), 2.02-1.69 (m, 4H), 1.66 (dd, J = 19.2, 7.4 Hz, 1H), 1.56-1.36 (m, 3H), 0.88 (s, 9H), 0.05 (s, 3H), 0.03 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 149.2, 139.5, 127.4, 107.5, 70.9, 64.4, 50.2, 45.5, 44.1, 37.6, 36.1, 35.2, 34.3, 25.8, 18.1, -4.6, -4.7; IR (neat, cm⁻¹): 3354, 2933, 2853,

1478, 1250, 1106, 1076, 1012, 878, 832, 774; HRMS (ESI/[M+H] $^+$) calcd. for $C_{19}H_{33}O_2Si$: 321.2250, found 321.2244.

2-((4-Methoxybenzyl)oxy)-6-methylene-1,2,5,6,7,8,9,9a-octahydro-4a,7-methanob enzo[7]annulen-8-yl)oxy)dimethylsilane (32)

To a solution of **31** (1.60 g, 5 mmol) in anhydrous DMF (50 mL) was added NaH (a 60% dispersion in mineral oil, 600 mg, 15 mmol) at room temperature. The resulting solution was stirred at room temperature for 25 minutes, and treated with PMBCl (2 mL, 15 mmol, 3 equiv). After stirring at the same temperature for 3 hours, the reaction mixture was quenched by addition of a saturated NH₄Cl aqueous solution (50 mL). The resulting mixture was extracted with diethyl ether (100 mL×3). The combined organic extracts were washed with brine, dried over Na₂SO₄, and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 9:1) of the residue gave a yellow oil (1.98 g, 4.5 mmol, 90%) as the product. 32: ¹H NMR $(400 \text{ MHz}, \text{CDCl}_3) \delta 7.28 \text{ (d, } J = 8.68 \text{ Hz}, \text{ 2H)}, 6.88 \text{ (d, } J = 8.41 \text{ Hz}, \text{ 2H)}, 5.77-5.71 \text{ (m, } J = 8.41 \text{ Hz}, \text{ 2H)}$ 2H), 4.95 (d, J = 11.2 Hz, 2H), 4.50 (dd, J = 34.0, 11.6 Hz, 2H), 3.83 (t, J = 6.0 Hz, 1H), 3,77 (s, 3H), 3.75 (m, 1H), 2.50 (s, 1H), 2.30 (s, 2H), 2.06-1.97 (m, 1H), 1.86-1.70 (m, 3H), 1.53-1.39 (m, 3H), 0.90 (s, 9H), 0.08 (s, 3H), 0.06 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 159.0, 149.4, 139.8, 130.9, 129.1, 125.6, 113.4, 107.4, 71.1, 70.5, 70.1, 55.2, 50.3, 45.4, 44.2, 37.7, 35.4, 34.8, 32.5, 25.8, 18.1, -4.6, -4.7; IR (neat, cm^{-1}): 2939, 2854, 2836, 1610, 1515, 1463, 1302, 1253, 1174, 1079, 1037, 820; HRMS (ESI/ $[M+H]^+$) calcd. for $C_{27}H_{41}O_3Si$: 441.2825, found 441.2833.

2-((4-Methoxybenzyl)oxy)-6-methylene-1,2,5,6,7,8,9,9a-octahydro-4a,7-methanob enzo[7]annulen-8-ol (14)

To a solution of 32 (1.76 g, 4 mmol) in anhydrous THF (20 mL) was added TBAF (a 1.0 M solution in THF, 12 mL, 12 mmol) at room temperature. The reaction mixture was stirred at room temperature for 12 hours, and then quenched by addition of a saturated NH₄Cl aqueous solution (20 mL). The aqueous layer was extracted with diethyl ether (50 mL×3). The combined organic extracts were washed with brine, dried over Na₂SO₄, and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 5:1) of the residue gave a yellow oil (1.30 g, 4 mmol, 100%) as the product. 14: ¹H NMR (400 MHz, CDCl₃) δ 7.27 (dd, J = 8.4, 3.0 Hz, 2H), 6.88 (dd, J = 6.4, 2.0 Hz, 2H), 5.83-5.68 (m, 2H), 4.97 (s, 2H), 4.49 (dd, J = 27.8, 11.6 Hz,2H), 3.89-3.76 (m, 1H), 3.76-3.65 (m, 5H), 2.62 (m, 1H), 2.39-2.22 (m, 2H), 2.02 (dd, J = 17.2, 7.4 Hz, 1H), 1.88-1.75 (m, 2H), 1.73-1.61 (m, 2H), 1.62-1.48 (m, 4H); ¹³C NMR (100 MHz, CDCl₃) δ 159.1, 150.5, 139.3, 130.9, 129.2, 125.9, 113.7, 106.9, 70.5, 70.2, 69.9, 55.2, 50.1, 45.3, 44.1, 37.4, 35.6, 34.9, 32.3; IR (neat, cm⁻¹): 3445, 3055, 2933, 2860, 1716, 1604, 1518, 1454, 1265, 1170, 1033, 887, 826, 737, 704; HRMS (ESI/[M+H]⁺) calcd. for $C_{21}H_{27}O_3$: 327.1960, found 327.1971.

2-((4-methoxybenzyl)oxy)-6-methylene-1,2,5,6,7,8,9,9a-octahydro-4a,7-methanob enzo[7]annulen-8-yl) S-methyl carbonodithioate (33)

To a stirred solution of 14 (1.02 g, 3.1 mmol) in dry THF (40 mL) was added sodium

hydride (a 60% dispersion in mineral oil, 800 mg, 20 mmol) at 0 °C. The resulting mixture was stirred at room temperature for 30 minutes. The mixture was treated with carbon disulfide (3.60 mL, 60.00 mmol) and heated under reflux for 1 hour. The reaction mixture was allowed to cool to room temperature, then treated with methyl iodide (1.2 mL, 20 mmol) and stirred for 16 hours. The reaction mixture was diluted with ethanol (8 mL), water (16 mL), and extracted with diethyl ether (50 mL×3). The combined organic extracts were washed with a saturated NH₄Cl aqueous solution (20 mL) followed by brine and dried over Na₂SO₄. After filtration and removal of the volatiles, silica gel flash column chromatography (hexanes/ethyl acetate = 9:1) of the residue gave a yellow oil (1.24 g, 2.96 mmol, 95%) as the product. 33: ¹H NMR (400 MHz, CDCl₃) δ 7.27 (d, J = 8.4 Hz, 2H), 6.95-6.81 (m, 2H), 5.81-5.71 (m, 2H), 5.69 (dddd, J = 11.0, 8.8, 7.8, 3.5 Hz, 1H), 4.99 (d, J = 20.0 Hz, 2H), 4.50 (dd, J = 27.6, 11.6 Hz, 2H), 3.85 (t, J = 2.0 Hz, 1H), 3.81 (s, 3H), 2.99 (s, 1H), 2.54 (s, 3H), 2.37 (s, 2H), 2.18-2.03 (m, 2H), 1.93-1.76 (m, 3H), 1.63-1.59 (m, 2H); ¹³C NMR (100 MHz, $CDCl_3$) δ 159.1, 150.5, 139.3, 130.9, 129.2, 125.9, 113.7, 106.9, 70.5, 70.2, 69.9, 55.2, 50.1, 45.3, 44.1, 37.4, 35.6, 34.9, 32.3; IR (neat, cm⁻¹): 2951, 2933, 2866, 1732, 1616, 1515, 1457, 1244, 1232, 1207, 1046, 960, 930, 880, 820; HRMS (ESI/[M+H]⁺) calcd. for C₂₁H₂₇O₃: 327.1960, found 327.1971.

3-Methylene-3,4,8,8a-tetrahydro-1*H*-2,4a-ethanonaphthalen-7(2*H*)-one (13, Nicolaou's intermediate)

To a stirred solution of 33 (654 mg, 2 mmol) in benzene (200 mL) at room

temperature were added nBu₃SnH (2.65 mL, 10 mmol) and AIBN (659 mg, 4 mmol). The mixture was heated under reflux for 4 hours. During the course of heating, additional amounts of nBu_3SnH (607 μL , 10 mmol \times 3) was added to ensure the completion of the reaction. After cooling to room temperature and removal of the volatiles, the residue was dissolved in diethyl ether and washed with a 1 N HCl aqueous solution (5 mL). The solution was brought to neutral condition by addition of a 1 N NaOH aqueous solution. The organic layer was separated, washed with brine, and concentrated to give a colorless oil as a crude product, which was used without further manipulations. To a solution of the crude product in CH₂Cl₂ (20 mL) and H₂O (0.1 mL) was added DDQ (0.91 g, 4 mmol) at room temperature. The mixture were stirred for 30 minutes, and then quenched by a saturated Na₂S₂O₃ aqueous (10 mL). The aqueous layer was extracted by diethyl ether (20 mL×2) and the combined organic extracts were washed with a saturated NaHCO₃ aqueous solution and brine, dried over MgSO₄, filtered and concentrated to give the crude product, which was used without further manipulations. To a stirred solution of the crude product in CH₂Cl₂ (20 mL) at room temperature was added NaHCO₃ (0.50 g, 6 mmol) and Dess-Martin periodinane (1.27 g, 3 mmol). The reaction mixture was stirred at room temperature for 30 minutes, and then the solution was quenched with a saturated Na₂S₂O₃ aqueous solution (10 mL). The aqueous layer was extracted by diethyl ether (20 mL×2) and the combined organic extracts were washed with a saturated NaHCO₃aqueous solution and brine, dried over MgSO₄, filtered and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 20:1) of the residue

gave a colorless oil (309 mg, 1.6 mmol, 82% in 3 steps from **33**) as the product. **Nicolaou's intermediate (13)**: 1 H NMR (300 MHz, CDCl₃) δ 6.57 (d, J = 10.0 Hz, 1H), 5.88 (d, J = 10.0 Hz, 1H), 4.84 (d, J = 1.7 Hz, 1H), 4.69 (d, J = 1.7 Hz, 1H), 2.48-2.40 (m, 2H), 2.36-2.29 (m, 2H), 2.19-2.08 (m, 2H), 2.03-1.96 (m, 1H), 1.82-1.68 (m, 3H), 1.55-1.48 (m, 1H), 1.20 (m, 1H); 13 C NMR (100 MHz, CDCl₃) δ 200.0, 156.6, 148.8, 127.7, 106.8, 41.6, 40.8, 36.0, 35.5, 35.4, 34.8, 26.3, 24.4; IR (neat, cm⁻¹): 2941, 2864, 1680, 1430, 1273, 1236, 1162, 876, 766; HRMS (ESI/[M+H]⁺) calcd. for $C_{13}H_{17}O$: 189.1279, found 189.1287.

6-Methylenedecahydro-4a,7-methanobenzo[7]annulene-4,8-diol (34)

To a stirred solution of **6a** (10.2 g, 50 mmol) in MeOH (250 mL) was added NaBH₄ (4.08 g, 110 mmol). The resulting mixture was stirred at room temperature for 2 hours, and then the volatiles were removed under reduced pressure. Silica gel flash column chromatography (hexanes/ethyl acetate = 2:1) of the residue gave an off-white amorphous solid (10.09 g, 48.5 mmol, 97%, a mixture of diastereomer) as the product. The major diastereomer of **34** was obtained by washing of the amorphous solid with hexanes a few times. **34** (major diastereomer): 1 H NMR (400 MHz, CDCl₃) δ 4.92 (s, 1H), 4.90 (s, 1H), 3.72 (m, 1H), 3.46 (m, 1H), 2.74 (d, J = 6.4 Hz, 1H), 2.62 (s, 1H), 1.91-1.85 (m, 3H), 1.76-1.54 (m, 5H), 1.46-1.26 (m, 6H); 13 C NMR (100 MHz, CDCl₃) δ 150.4, 106.5, 72.6, 69.8, 51.0, 48.7, 42.6, 39.8, 35.6, 32.0, 28.7, 28.3, 24.3; IR (neat, cm⁻¹): 3378, 2939, 2859, 1726, 1652, 1452, 1253, 1043, 874, 735; HRMS (ESI/[M+H]⁺) calcd. for C₁₃H₂₁O₂: 209.1542, found 209.1549. The stereochemistry of

34 was assigned by comparing the ¹H and ¹³C NMR spectra with the product that obtained by TBAF deprotection of the major diastereomer of **34**.

8-((*tert*-Butyldimethylsilyl)oxy)-6-methylenedecahydro-4a,7-methanobenzo[7]an nulen-4-ol (35)

To a stirred solution of **34** (9.4 g of a mixture of diastereomers, 45 mmol) in CH₂Cl₂ (450 mL) was added imidazole (7.65 g, 112.5 mmol) and TBSCl (7.46 g, 49.5 mmol). The reaction mixture was stirred at room temperature for 4 hours, and then quenched by addition of a saturated NaHCO₃ aqueous solution (50 mL). The aqueous layer was extracted with CH₂Cl₂ (50 mL×2) and the combined organic extracts were washed with brine (30 mL), dried over MgSO₄, filtered and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 10:1) of the residue gave a white solid (11.6 g, 36 mmol, 80%, a roughly 3:1 diastereomeric mixture) as the product along with 34 (0.9 g, 4.3 mmol) being recovered. 35 (major diastereomer): mp = 73.3-74.1 °C, ¹H NMR (400 MHz, CDCl₃) δ 4.93 (d, J = 1.8 Hz, 1H), 4.88 (s, 1H), 3.78 (ddd, J = 10.8, 5.6, 3.0 Hz, 1H), 3.48 (d, J = 5.8 Hz, 1H), 2.71 (td, J = 16.6, 2.6 Hz, 1H),2.54 (s, 1H), 1.92 (dd, J = 16.6, 1.6 Hz, 1H), 1.80-1.73 (m, 2H), 1.64-1.59 (m, 2H), 1.53-1.29 (m, 8H), 0.88 (s, 9H), 0.06 (s, 3H), 0.04 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 149.2, 107.1, 72.9, 71.1, 51.2, 48.7, 42.6, 39.8, 35.4, 32.0, 29.1, 28.4, 25.80, 24.4, 18.1, -4.6, -4.7; IR (neat, cm⁻¹): 3397, 2957, 2933, 2890, 2860, 1659, 1473, 1463, 1372, 1253, 1110, 1082, 1055, 881, 863, 835, 771; HRMS (ESI/[M+H]⁺) calcd. for $C_{19}H_{35}O_2Si: 323.2406$, found 323.2413. **35** (minor diastereomer): ¹H NMR (400 MHz,

CDCl₃) δ 4.85 (s, 1H), 4.81 (s, 1H), 3.82 (t, J = 4.0 Hz, 1H), 3.39 (dd, J = 7.2, 4.0 Hz, 1H), 2.73-2.69 (m, 2H), 2.06-1.81 (m, 4H), 1.71-1.66 (m, 2H), 1.57-1.32 (m, 8H), 0.88 (s, 9H), 0.06 (s, 3H), 0.04 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 152.5 105.0, 73.8, 72.9, 50.2, 49.7, 41.7, 39.1, 33.0, 32.5, 30.6, 25.8, 24.5, 23.3, 18.0, -4.0, -5.0; HRMS (ESI/[M+H]⁺) calcd. for C₁₉H₃₅O₂Si: 323.2406, found 323.2400.

6-Methylene-1,2,5,6,7,8,9,9a-octahydro-4a,7-methanobenzo[7]annulen-8-yl)oxy)si lane (36)

To a solution of **35** (9.66 g, 30 mmol) and pyridine (24 mL) in CH₂Cl₂ (500 mL) at -78 °C was added Tf₂O (12.3 mL, 75 mmol). The reaction mixture was allowed to warm to 0 °C over 15 minutes and treated with isopropanol (3.6 mL, 45 mmol). The resulting solution was stirred at 25 °C for 15 minutes and then quenched with saturated aqueous NaHCO₃ solution. The aqueous layer was extracted with diethyl ether (100 mL×3). The combined organic extracts were washed with saturated aqueous NH₄Cl solution, water, and brine; dried over MgSO₄, and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 99:1) of the residue gave a colorless oil (8.6 g, 28.2 mmol, 84%) as the product. **36**: ¹H NMR (400 MHz, CDCl₃ δ 5.71-5.53 (m, 1H), 5.46 (d, J = 9.8 Hz, 1H), 4.95 (s, 1H), 4.92 (s, 1H), 3.76 (ddd, J = 10.8, 5.8, 3.0 Hz, 1H), 2.50 (s, 1H), 2.38-2.15 (m, 2H), 2.07-2.01 (m, 2H), 1.89-1.62 (m, 3H), 1.58-1.44 (m, 4H), 0.90 (s, 9H), 0.07 (s, 3H), 0.06 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 150.1, 134.9, 126.7, 107.1, 71.2, 50.8, 46.0, 43.8, 40.4, 40.1, 36.1, 27.3, 26.3, 25.8, 18.1, -4.6, -4.7; IR (neat, cm⁻¹): 2963, 2939, 2866, 1680, 1472,

1253, 1094, 878, 832, 777; HRMS (ESI/[M+H] $^{+}$) calcd. for C₁₉H₃₃OSi: 305.2301, found 305.2304.

6-Methylene-1,2,5,6,7,8,9,9a-octahydro-4a,7-methanobenzo[7]annulen-8-ol (37)

To a solution of **36** (6.08 g, 20 mmol) in THF (50 mL) and MeOH (5mL) was added a 2 N HCl aqueous solution (50 mL) at room temperature. The reaction mixture was stirred for 1 hour, and then quenched by saturated aqueous NaHCO₃ solution. After diluted with diethyl ether (100 mL), the aqueous layer was extracted with diethyl ether (100 mL×3) and the combined organic extracts were washed with brine (30 mL), dried over Na₂SO₄, filtered and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 9:1) of the residue gave a white solid (3.80 g, 20 mmol, 100%) as the product. **37**: mp = 59.7-60.6 °C, ¹H NMR (400 MHz, CDCl₃) δ 5.60 (td, J = 9.4, 3.4 Hz, 1H), 5.46 (td, J = 9.8, 1.8 Hz, 1H), 4.95 (s, 2H), 3.72 (s, 1H), 2.60 (s, 1H), 2.38-2.18 (m, 2H), 2.07-2.04 (m, 2H), 1.77-1.67 (m, 4H), 1.66-1.46 (m, 4H); ¹³C NMR (100 MHz, CDCl₃) δ 151.1, 134.4, 126.9, 106.5, 70.0, 50.6, 45.8, 43.7, 40.4, 39.8, 36.1, 26.9, 26.2; IR (neat, cm⁻¹): 3403, 2927, 2866, 1652, 1451, 1427, 1046, 881, 698; HRMS (ESI/[M+H]⁺) calcd. for C₁₃H₁₉O: 191.1436, found 191.1439.

6-Methylene-1,2,6,7,9,9a-hexahydro-4a,7-methanobenzo[7]annulen-8(5*H*)-one (12)

To a stirred solution of **37** (1.90 g, 10 mmol) in CH₂Cl₂ (100 mL) at room temperature was added NaHCO₃ (2.52 g, 30 mmol) and Dess-Martin periodinane (6.39 g, 15

mmol). The reaction mixture was stirred at room temperature for 30 min, and then the solution was quenched with a saturated $Na_2S_2O_3$ aqueous solution (20 mL). The aqueous layer was extracted by diethyl ether (50 mL×3) and the combined organic extracts were washed with saturated a saturated $NaHCO_3$ aqueous solution and brine; dried over $MgSO_4$, filtered and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 20:1) of the residue gave a colorless oil (1.69 g, 9.0 mmol, 90%) as the product.

$8-((\textit{tert}-Butyldimethylsilyl)oxy)-6-methyleneoctahydro-4a, 7-methanobenzo [7] ann \\ ulen-4(1H)-one~(38)$

To a stirred solution of **35** (6.44 g, 20 mmol) in CH₂Cl₂ (200 mL) at room temperature was added NaHCO₃ (5.04 g, 60 mmol) and Dess-Martin periodinane (12.7 g, 30 mmol). The reaction mixture was stirred at room temperature for 30 min, and then quenched with a saturated Na₂S₂O₃ aqueous solution (40 mL). The aqueous layer was extracted by diethyl ether (50 mL×2) and the combined organic extracts were washed with a saturated NaHCO₃ aqueous solution and brine, dried over MgSO₄, filtered and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 20:1) of the residue gave a white solid (5.76 g, 18 mmol, 90%) as the product. **38**: mp = 73.0-73.9 °C, ¹H NMR (400 MHz, CDCl₃) δ 4.94 (s, 2H), 3.88 (ddd, J = 10.6, 5.8, 3.0 Hz, 1H), 3.09 (td, J = 17.5, 2.7 Hz, 1H), 2.62 (dd, J = 5.1, 2.8 Hz, 1H), 2.48-2.23 (m, 2H), 2.16-1.87 (m, 5H), 1.76-1.52 (m, 6H), 0.89 (s, 9H), 0.07 (s, 3H), 0.05 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 213.0, 147.3, 107.9, 70.1, 57.3, 51.2, 44.4, 39.0, 37.7,

36.6, 35.2, 28.8, 26.2, 25.7, 18.1, -4.6, -4.7; IR (neat, cm⁻¹): 2945, 2866, 1710, 1658, 1472, 1256, 1131, 1106, 1079, 875, 838, 780; HRMS (ESI/[M+H]⁺) calcd. for C₁₉H₃₄O₂Si: 322.2328, found 322.2333.

8-((*tert*-Butyldimethylsilyl)oxy)-6-methylene-5,6,7,8,9,9a-hexahydro-4a,7-methan obenzo[7]annulen-4(1*H*)-one (29) from 38

To a solution of diisopropylamine (3.29 mL, 23.4 mmol) in THF (24 mL) was added dropwise a solution of *n*butyllithium (a 2.5 M solution in hexanes, 9 mL, 22.5 mmol,) at -78 °C under argon. After stirred for 30 minutes at -78 °C, this solution was added dropwise to a solution of **38** (18 mmol) in THF (36 mL) via cannulation. The resulting mixture was continued to stir at -78 °C for 1 hour and then treated with trimethylsilyl chloride (freshly distilled from calcium hydride, 11 mL, 90 mmol). After stirring at -78 °C for another hour, the volatiles were removed under reduced pressure at 0 °C. The residue was then dissolved in CH₃CN (180 mL) and treated with Pd(OAc)₂ (4.04 g, 18 mmol). The resulting mixture was stirred at room temperature for 12 hours. The reaction mixture was then filtered and concentrated. Silica gel flash column chromatography (hexanes/ethyl acetate = 20:1) of the residue gave a white solid (4.97 g, 15.6 mmol, 87%) as the product.

Acknowledgments

This work is supported by the National Natural Science Foundation of China (Grant No. 21272012, 21232001 and 21071052), Shenzhen Science and Technology

Innovation Commission of People's Government of Shenzhen Municipality (ZDSY20120614144410389 and KQTD201103) and the Peking University Shenzhen Graduate School. Special thanks to Prof. Ga-Lai Sonoe Law and her student, Mr. Wai-Sum Lo, from the Hong Kong Polytechnic University for their constructive comments on this manuscript.

Supporting Information

Binding enthalpies of 29 Lewis acids towards styrene and benzaldehyde, total energies and coordinates of optimized minima and transition states, the X-ray structures of compounds **6a** and **6i**, **and** ¹H NMR and ¹³C NMR spectra for all the new compounds. This material is available free of charge via the Internet at http://pubs.acs.org.
