The Wolff-Kishner Reaction with α -Oximinoketones

Sir:

The Wolff-Kishner reaction is usually a very reliable and useful method for converting a carbonyl group to methylene. However, when applied to α - or β -substituted ketones and aldehydes,¹ some other structural change may occur as well. We have found that α -oximinoketones, when subjected to this reaction, may lead to a number of products, including in one instance normal reduction to the methylene group.

When 1,2-indanedione 2-oxime (I) was exposed to the usual Wolff-Kishner reaction conditions (hydrazine, potassium hydroxide, diethylene glycol, 190°) a 73% yield of indano[1,2]-v-triazole (II) resulted (m.p. 140–141°. *Anal.* Found: C, 68.8; H, 4.4; N, 26.8). The hydrazone of I (m.p. 240–

242°, *Anal.* Found: C, 61.9; H, 5.2; N, 24.1) gave the same product when exposed to the action of alkali in diethylene glycol. This appears to be a possible method for preparing v-triazoles in which the nitrogen is unsubstituted.² However, the reaction is far from general.

When α -oximinoacetophenone was treated under the same conditions, the only product isolated was phenylacetic acid (in 70% yield). From 2,3-butanedione 2-oxime, 2,3-butanedione 3-hydrazone-2-oxime was obtained in 65% yield with no evidence of any triazole formation. And from 2,3-octanedione 3-oxime a 90% yield resulted of the normal reduction product, 3-octanone oxime (b.p. 115°/14 mm., n_D^{25} 1.4492; reported³ b.p. 92°/5 mm., n_D^{20} 1.4517. *Anal.* Found: C, 67.4; H, 11.7; N, 9.5).

The mechanism of this reaction and its applica-

tion to α -oximinoketones in general is under further study.

C6-Hydroxylated Steroids. I. Preparation of 6 α - and 6 β -Hydroxyhydrocortisone and 6 α -Hydroxyprednisolone

Sir:

We wish here to describe the first chemical preparation of 6 α - and 6 β -hydroxyhydrocortisone (Ia, IIa) and 6 α -hydroxyprednisolone (Ic).¹

6 β -Hydroxyhydrocortisone (IIa) has been established as a metabolite of hydrocortisone in animal and human studies.^{2a} Burstein and Dorfman^{2b} have speculated that 6 α -hydroxyhydrocortisone (Ia) may also be a metabolite of hydrocortisone in the guinea pig.

The 5 α ,6 α -epoxide III of hydrocortisone bis-thylene ketal³ on treatment with either perchloric

(1) F. Sondheimer, O. Mancera, and G. Rosenkranz, *J. Am. Chem. Soc.*, **76**, 5020 (1954), have described the preparation of 6 β -hydroxycortisone. Also the 6 α -hydroxy analogs of cortisone and prednisone have been prepared, J. A. Edwards, J. Iriarte, C. Djerassi, and H. J. Ringold, forthcoming publication, as cited by A. Bowers and co-workers, *J. Am. Chem. Soc.* **81**, 5233 (1959).

(2) A number of *N*-phenyltriazoles have been obtained by the action of acids or acetic anhydride on oxime-phenylhydrazones [F. R. Benson and W. L. Savell, *Chem. Revs.*, **46**, 1 (1950)]. Also, M. Ruccia and D. Spinelli, [*Gazz. chim. ital.*, **89**, 1654 (1959)] have considered the reaction with hydrazone-oximes.

(3) F. Asinger, G. Geiseler, and P. Laue, *Ber.*, **90**, 485 (1957).

or sulfuric acid in aqueous acetone gave 5 α ,6 β ,11 β ,17 α ,21-pentahydroxypregnane-3,20-dione (IV) [m.p. 273–274° dec., $[\alpha]_D^{25} + 35^\circ$ (pyridine). *Anal.* Found: C, 63.44; H, 8.46]. Acetylation of IV at room temperature gave a separable mixture of 21-monoacetate V [m.p. 280–282°, $[\alpha]_D^{25} + 35^\circ$ (pyridine). *Anal.* Found: C, 62.62; H, 8.00], and the 6,21-diacetate VI [m.p. 145–155°, $[\alpha]_D^{25} + 6^\circ$ (pyridine). *Anal.* Found: C, 62.46; H, 7.81]. Acetylation at 100° provided exclusively the 6,21-diacetate VI.⁵

Treatment of the 6,21-diacetate VI in methylene chloride with hydrogen chloride at 0° provided a mixture of 6 α -hydroxyhydrocortisone 6,21-diacetate (Ib) and 6 β -hydroxyhydrocortisone 6,21-diacetate (IIb) separated by chromatography on magnesium silicate. This gave the 6 α ,21-diacetate Ib [m.p. 128–130°, $\lambda_{\max}^{\text{CH}_3\text{OH}}$ 236 m μ (ϵ 12,800), $[\alpha]_D^{25} + 107^\circ$ (chloroform). *Anal.* Found: C, 64.72; H, 7.69] and the *impure* 6 β ,21-diacetate IIb. When the reaction was performed in methylene chloride containing ethanol only the thermodynamically more stable 6 β ,21-diacetate Ib was obtained. Saponification of Ib with potassium carbonate gave

6 α -hydroxyhydrocortisone (Ia) as a solvate [m.p. 220–222°, $\lambda_{\max}^{\text{CH}_3\text{OH}}$ 241 m μ (ϵ 13,300), $[\alpha]_D^{25} + 122^\circ$ (pyridine). *Anal.* Found: C, 64.42; H, 7.96]. *Impure* 6 β ,21-diacetate IIb on saponification followed by partition chromatography on diatomaceous earth provided 6 β -hydroxyhydrocortisone (IIa) [m.p. 241–243°, $\lambda_{\max}^{\text{CH}_3\text{OH}}$ 234–235 m μ (ϵ 12,000), $[\alpha]_D^{25} + 90^\circ$ (methanol)].^{2b,d} Acetylation gave the 6 β ,21-diacetate IIb [m.p. 148–150°, $\lambda_{\max}^{\text{CH}_3\text{OH}}$ 235–236 m μ (ϵ 12,100), $[\alpha]_D^{25} + 89^\circ$ (methanol)].^{2b,d;6}

Finally, 6 α -hydroxyhydrocortisone 6,21-diacetate (Ib) on selenium dioxide dehydrogenation in *t*-butyl alcohol and acetic acid⁷ gave 6 α -hydroxyprednisolone 6,21-diacetate (Id) [m.p. 146–148°, $\lambda_{\max}^{\text{CH}_3\text{OH}}$ 241–242 m μ (ϵ 13,900), $[\alpha]_D^{25} + 80^\circ$ (chloroform). *Anal.* Found: C, 65.08; H, 7.48]. Saponification gave 6 α -hydroxyprednisolone (Ic) as a solvate [m.p. 248–250°, $\lambda_{\max}^{\text{CH}_3\text{OH}}$ 242 m μ (ϵ 13,800), $[\alpha]_D^{52} + 88^\circ$ (methanol). *Anal.* Found: C, 66.28; H, 7.97].

(4) All attempts to obtain a sample with a sharp m.p. were unsuccessful. However, the compound was shown to be homogeneous by paper strip chromatographic analysis. In fact, all compounds reported herein were similarly shown to be homogeneous.

(5) The 6,21-diacetate VI usually proved difficult to obtain in a crystalline form, and generally was used as an oil in subsequent transformations. The oil was demonstrated by paper chromatographic analysis to be practically homogeneous.

(6) The infrared absorption spectra of IIa and b were identical with those of the Worcester samples. We are indebted to Dr. S. Burstein for these comparisons.
