Short and Efficient Synthesis of Enantiomerically Pure Building Blocks for the Preparation of Carbocyclic Nucleosides and Prostaglandins via Diastereoselective Dihydroxylation of 5-Menthyloxy-2[5H]-furanone

Bernd Sundermann and Hans-Dieter Scharf*

Institut für Organische Chemie, RWTH Aachen, D-52056 Aachen, Germany

Abstract : A short and efficient synthesis of both enantiomerically pure 2,3-(Cyclohexylidenedioxy)-4-cyclopentenones 4 and *ent-4* from the readily available 5menthyloxy-2[5H]-furanones 1 and **ent-1** is presented. The key step is the substrate controlled diastereoselective dihydroxylation of 1 and **ent-1**. Copyright © 1996 Elsevier Science Ltd '

The photochemistry of the well-known 5-menthyloxy-2[5H]-furanones 1 and ent-1 has been a subject of our research in the past.¹ Recently we studied the preparation of their precursor 5-hydroxy-2[5H]-furanone by photooxygenation of furfural² on a multimolar scale (> 20 mol/d) using concentrated sunlight.³ Now we can report that 5-menthyloxy-2[5H]-furanones 1 and ent-1, which are easily available from 5-hydroxy-2[5H]-furanone in enantiomerically pure form,⁴ can be used for the preparation of enantiomerically pure dihydroxycyclopentenone derivatives 4 and ent-4.

Acetals of enantiomerically pure *cis*-2,3-dihydroxy-4-cyclopentenone are frequently used intermediates⁵ for the preparation of important natural products and their analogues, for example Prostaglandin E_2^6 , neplanocin A^7 and aristeromycin⁸. They have been prepared from cyclopentadiene^{6a,9}, D-ribonolactone^{7c,10}, D-ribose and D-lyxose¹¹, D-mannose^{7c}, L-tartaric acid^{8c,12}, toluene and chloro- and bromobenzene¹³.

We will now describe a simple three step procedure for the preparation of enantiomerically pure 4 and ent-4 in good yield starting from (+)-(5S)-5-((+)-menthyl)oxy-2[5H]-furanone 1 and (-)-(5R)-5-((-)-menthyl)oxy-2[5H]-furanone ent-1 respectively (Scheme 1): Furanone 1 is dihydroxylated diasteroselectively with a slight excess of KMnO4 to give 62 % of (+)- α -L-((+)-menthyl)erythruronofuranoside 2 as the sole product (500 MHz ¹H NMR, de \geq 98 %). The methyl glucoside of ent-2 has been used for the preparation of the hydroxyamino acid moiety of AI-77-B¹⁴. Borontrifluoride mediated acetalization¹⁵ of 2 gives acetals (+)-3a and (+)-3b in 89 % and 84 % yield respectively. ¹H NMR-Spectra of 2, 3a and 3b show a sharp singlet for the acetal proton H1, indicating a dihedral angle of 90° between H1 and H2 and thus proving a trans relationship. Obviously the (+)-menthyl substituent shields the ul-side of 1 effectively. Dihydroxylation can occur on the lk-side only.

i) KMnO₄, 62 %; ii) R₂CO, BF₃•OEt₂, 89 % (3a), 84 % (3b); iii) (H₃CO)₂POCH₂Li, 87 % (45 % from 1) Scheme 1

The cyclohexylidene-acetal **3b** is reacted with lithium dimethyl methylphosphonate^{7c,16} to give (-)-2,3-(cyclohexylidenedioxy)-4-cyclopentenone **4** in 87 % yield. Analytical data of **4** are in accordance with the literature, except for the melting point which is found to be 87 °C instead of 65 °C as reported by Borcherding et al.^{7c}. Consequently the enantiomeric purity of **4** was checked by chiral capillary GC. No trace of **ent-4** was found indicating an ee > 99 %.

Experimental Section

(+)- α -L-((+)-Menthyl)ervthruronofuranoside 2. (+)-(5S)-5-((+)-Menthyl)oxy-2[5H]-furanone 1 (239) g, 1.00 mol) was dissolved in a mixture of acetone (3 l) and water (300 ml) in a 5 l beaker with a large magnetic stirring bar. The solution was cooled to -5 °C and KMnO₄ (158 g, 1.00 mol) was added with stirring, maintaining the temperature below 0 °C. The mixture was stirred for 2 h before another portion of KMnO₄ (16 g, 0.10 mol) was added. Stirring was continued for 30 min and conversion of 1 was checked by TLC since an additional portion of KMnO4 may be necessary for complete conversion. The mixture was heated to 50 °C for 10 min without stirring and filtered with suction. The clear and colourless filtrate (excess KMnO₄ can be destroyed with MeOH and the mixture filtered again) was concentrated at room temperature to give a white solid which was dried in vacuum. The crude product was pulverized and spread out on a glass plate until the smell of menthol had disappeared (1 - 2 d. Caution is necessary as the product is very sensitive towards vapours of bases and strong acids). The material obtained (169 g, 0.62 mol, 62 %) was analytically pure. $R_f =$ 0.30 (CHCl₃/MeOH 9:1), $[\alpha]_D^{20} = +180$ (c = 1.00, MeOH), mp = 175 °C. (+)-2,3-O-Isopropylidene-α-L-((+)-menthyl)erythruronofuranoside 3a. Diol 2 (30 g, 110 mmol) was suspended in ethylacetate (150 ml) and acetone (7.68 g, 132 mmol) and cooled in an ice bath. BF3•OEt2 (15.6 g, 110 mmol) was added dropwise to the stirred suspension and stirring was continued until 2 had dissolved (4 - 6 h). The ice bath was removed and the slightly vellow solution was stirred for 2 h at room temperature before being poured into a stirred suspension of NaHCO₃ (30 g) in ethylacetate (150 ml). After being stirred for at least 2 h (or overnight) the suspension was filtered, the filtrate dried over MgSO₄ and concentrated to a yellow oil which was purified by flash chromatography with hexanes/ether 10:1 to give a colourless syrup (30.6 g, 98.0 mmol, 89 %) which solidifies upon standing. $R_f = 0.72$ (CHCl₃/MeOH 9:1). $[\alpha]_{D}^{20} = +112$ (c = 0.99, CHCl₃), mp = 67 °C. IR (KBr, cm⁻¹) 2955, 2930, 2870, 1810, 1795, 1455, 1390, 1380, 1230, 1155, 1105, 970, 920, 900, 840. ¹H NMR (CDCl₃, 300 MHz) δ 5.62 (s, 1H), 4.61 (d, J = 5.4 Hz, 1H), 4.54 (d, J = 5.4 Hz, 1H), 3.57 (dt, $J_1 = 4.2$, $J_2 = 10.7$ Hz, 1H), 2.13 (br d, J = 11 Hz, 1H), 1.94 $(\text{dsep, } J_1 = 2.7, J_2 = 7.0 \text{ Hz}, 1\text{H}), 1.66 \text{ (m, 2H)}, 1.46 \text{ (s, 3H)}, 1.38 \text{ (s, 3H)}, 1.22 \text{ (m, 2H)}, 1.00 \text{ (m, 1H)}, 1.00 \text{ (m, 2H)}, 1.00 \text{ (m, 2H)}$ 0.94 (d, J = 6.5 Hz, 3H), 0.94 (m, 1H), 0.86 (d, J = 7.1 Hz, 3H), 0.85 (m, 1H), 0.75 (d, J = 6.8 Hz, 3H). ¹³C NMR (CDCl₃, 75 MHz) δ 173.7 (C), 114.3 (C), 100.5 (CH), 79.7 (CH), 77.5 (CH), 74.6 (CH), 47.5 (CH), 39.5 (CH₂), 34.2 (CH₂), 31.3 (CH), 26.7 (CH), 25.7 (CH₃), 25.5 (CH₃), 23.1 (CH₂), 22.2 (CH₃), 20.8 (CH₃), 15.6 (CH₃). (-)-2,3-(Cyclohexylidenedioxy)-4-cyclopentenone 4^{7c} . A 1 l three-necked flask fitted with a septum and a 100 ml addition funnel with a glass jacket allowing the addition funnel to be cooled was flame dried. The flask was charged with dimethyl methylphosphonate (7.45 g, 60.0 mmol) in dry THF (400 ml) and cooled to -78 °C. **3b** (21.0 g, 60.0 mmol) was dissolved in THF (50 ml) and poured into the addition funnel which was cooled to -78 °C, too. n-Butyllithium (15 % in hexane (1.6 M), 25.6 g, 60.0 mmol) was added dropwise from a syringe to the stirred phosphonate solution (15 - 20 min) and stirring was continued for 30 min. The cooled

solution of **3b** was added in one portion in a few seconds. After stirring for additional 2 h the reaction mixture was allowed to warm to room temperature (45 - 60 min). The solution was poured into a stirred mixture of ether (500 ml) and water (100ml) and the layers were separated quickly. The aqueous layer was extracted with ether (50 ml) and the combined organic phase was washed with brine, dried over MgSO4 and concentrated at room temperature. The residue was purified by flash chromatography with hexanes/ether 5:1 to give 4 as a colourless syrup (10.1 g, 52.0 mmol, 87 %) which solidifies in the freezer. Nonetheless 4 is a remarkably volatile solid with a strong, gasoline-like odour and should not be subjected to vacuum for a prolonged time. Re = 0.68 (CHCl₃/MeOH 9:1), $[\alpha]_{D}^{20} = -73$ (c = 1.00, CHCl₃), mp = 87 °C, IR (KBr, cm⁻¹) 2945, 2930, 2870) 1800. 1450. 1370. 1360. 1165. 1120. 925. ¹H NMR (CDCl₃, 300 MHz) δ 7.61 (dd, J₁ = 2.3, J₂ = 5.7 Hz, 1H), 6.20 (d, J = 5.7 Hz, 1H), 5.26 (ddd, $J_1 = 0.7$, $J_2 = 2.3$, $J_3 = 5.4$ Hz, 1H), 4.46 (d, J = 5.4 Hz, 1H), 1.59 (m, 8H), 1.38 (m, 2H). ¹³C NMR (CDCl₃, 75 MHz) δ 203.3 (C), 159.9 (CH), 134.3 (CH), 116.4 (C), 78.3 (CH), 76.2 (CH), 37.3 (CH₂), 35.7 (CH₂), 24.9 (CH₂), 23.8 (CH₂), 23.6 (CH₂), MS m/z (rel. int.) 194 (M⁺, 42). 165 (22). 151 (100), 98 (15), 97 (25), 96 (23), 80 (9), 69 (19), 68 (73), 55 (99).
