**Key Words :** Chiral cyclopropanols,  $\beta$ -Chloro-alkyl amides. Samarium iodide, Intramolecular cyclisation.

**Abstract :** Samarium diiodide promotes under mild conditions, intramolecular reductive cyclisation of  $\beta$ -chloro-substituted amides, and leads with an excellent diastereomeric excess and high yield to functionalised optically active cyclopropanols.

We have recently reported that cyclopropanone hemiketal **1a**, readily available from sodium induced cyclisation of  $\beta$ -halo esters **2** in the presence of  $\text{Me}_3\text{SiCl}$ ,<sup>1</sup> underwent a one pot asymmetric Strecker synthesis to give the (*R*)- or (*S*)-2,3-methanovaline **3** ( $\text{R}=\text{R}'=\text{CH}_3$ )<sup>2a,b</sup> an useful herbicide.<sup>2c</sup> Unfortunately this cyclisation did not allow, access to the corresponding amino alcohol **1b** which in turn would constitute a more straightforward precursor of chiral methanoamino acids **3**.

**1a** :  $\text{Y} = \text{OR}$   
**b** :  $\text{Y} = \text{NR}'$

**2****3**

In order to obtain such amino alcohols **1b**, we want to test their possible formation from amide derivatives **2** ( $\text{Y} = \text{oxazolidinone}$ ) by an internal  $\text{S}_\text{N}2$  reaction. Among the metals which can be used, samarium(II) iodide<sup>3</sup> appears the more promising. In these Barbier type processes<sup>3d</sup> carbanionic species seem involved.<sup>4</sup>

The amides used in this study were prepared as follows: **4** - **6** were obtained following the Evans' procedure<sup>5</sup> by N-acylation of the oxazolidinones derived from (*R*)-phenylglycinol and (*S*)-phenylalaninol. **7** - **8** were synthesised starting from the amide **4** by stereoselective enolisation with LDA in THF-HMPA<sup>6</sup> ( $-78^\circ$  to  $-20^\circ\text{C}$ ), followed by alkylation with 3 equiv of chloriodomethane ( $-78^\circ$  to  $-20^\circ\text{C}$ ) (high yield,  $\text{ds} > 95\%$ ). The amide **9** was prepared by acylation of (*R*)-phenyloxazolidinone with racemic 2-*tert*-butyl-3-chloropropionyl chloride and subsequent separation of the resulting two diastereomers **8** and **9**.

**4a** :  $\text{X} = \text{Bn}$ ,  $\text{Y} = \text{H}$   
**4b** :  $\text{X} = \text{H}$ ,  $\text{Y} = \text{Ph}$

<sup>a</sup> Stereochemistry of the major diastereomer; <sup>b</sup> Starting material (36%) was recovered.

As expected we found that with  $\text{SmI}_2$  in THF <sup>7</sup> in the presence of HMPA <sup>8</sup> the  $\beta$ -halo-substituted amides <sup>9</sup> cyclised smoothly. Optimum reaction conditions for the cyclisations involved slow addition (20 min) of a solution of the chloroalkyl amide in THF (ca : 0.05M in substrate) to 2.2 equiv of a 0.13M solution of  $\text{SmI}_2$  containing 7 equiv of HMPA at  $-78^\circ\text{C}$ , then warming to  $-20^\circ\text{C}$  (1 h) and quenching at this temperature with satd.  $\text{NH}_4\text{Cl}$  solution. Reactions run in the absence of HMPA provided only low yield of the desired products, and the starting material was mainly recovered.

Thus, the intramolecular reaction of **5** under  $\text{SmI}_2$ -THF in the presence of HMPA gave exclusively the alcohol **10** in 81% yield, ( $[\alpha]_D^{+38}$  (c 0.35,  $\text{CHCl}_3$ )), (Table I, entry 1). With our previous

conditions known to promote cyclisation (Na/TMSCl under sonication), <sup>1</sup> a large amount of the unreacted starting material and a mixture of unidentified products were obtained.

Intramolecular reductive coupling of **6** (entry 2) furnished a separable mixture of cyclopropanol **11** and enamide **12** (60%) probably formed by a competitive intramolecular hydrogen atom transfer from the C<sub>4</sub> position, followed by ring opening of oxazolidinone and decarboxylation. Cyclisation of **7** (entry 3) gave the cyclopropanol **13** with an excellent diastereoselectivity, over 95% ( $[\alpha]_D +27.0$  (c 1, CHCl<sub>3</sub>)). The cyclisation of **8** (entry 4) led only to one diastereomer **14** ( $[\alpha]_D -68.6$  (c 1, CHCl<sub>3</sub>)), accompanied by 23% of **15**, <sup>10</sup> formed by a ring opening reaction of **14** or by competing hydrogen atom abstraction from THF on the alkylsamarium(III) intermediate.

The amide **9**, furnished the cyclopropanol **16** in only 34% yield ( $[\alpha]_D -133.3$  (c 0.7, CHCl<sub>3</sub>)), the uncyclised product **17** (30%) and unreacted starting material (36%).

In all cyclisations induced by SmI<sub>2</sub>-THF-HMPA, the nucleophilic species <sup>4</sup> probably entered the less shielded face of **A** from the side opposite to the bulky substituent of the chiral auxiliary favoured by a six-membered Sm(III) chelated ring (**A** intermediate) which provided a rigid template for subsequent cyclisation. However the complexed intermediate **A'** with two molecules of [Sm] cannot be excluded. In the case of **9**, the low yield observed in the formation of **16**, seems due to the highly disfavoured cyclisation pathway generated by the enhanced steric interactions in the intermediate **A-9**, consequently the intermediate **B** becomes more favourable.

In the products **13**, **14** and **16** we assume that the hydroxyl group is *cis* to the *tert*-butyl moiety. However we were not able to confirm (<sup>1</sup>H NMR NOE difference experiments) this relative configuration. Further studies are underway.

Several attempts were made to transform the cyclopropanol **13** into the corresponding nitrile **18a** by reaction with KCN in acetic acid in the presence of PPh<sub>3</sub>. Only the ring opened products **19** (45%) and **20** (55%) were obtained. In the same way, by reaction with Me<sub>3</sub>SiCN in the presence of SnCl<sub>4</sub> the silyl alcohol **18b** (94%) was isolated.

In conclusion a SmI<sub>2</sub>-promoted intramolecular reductive cyclisation reaction of a series of β-chloro-substituted amides has provided the corresponding cyclopropanols <sup>11</sup> in high yield and excellent

diastereomeric excess. Further applications of this reductive cyclisation to natural products syntheses are currently under investigation.
