# 6-Endo- and 5-Exo-digonal Cyclizations of o-Hydroxyphenyl Ethynyl Ketones: A Key Step for Highly Selective Benzopyranone Formation

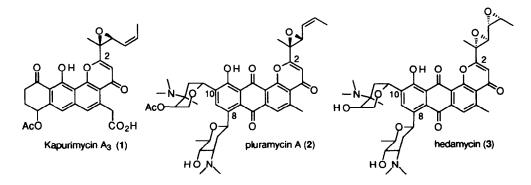

Kazuhiko Nakatani, Akimitsu Okamoto, and Isao Saito\*

Department of Synthetic Chemistry and Biological Chemistry, Faculty of Engineering, Kyoto University, Kyoto 606-01, Japan

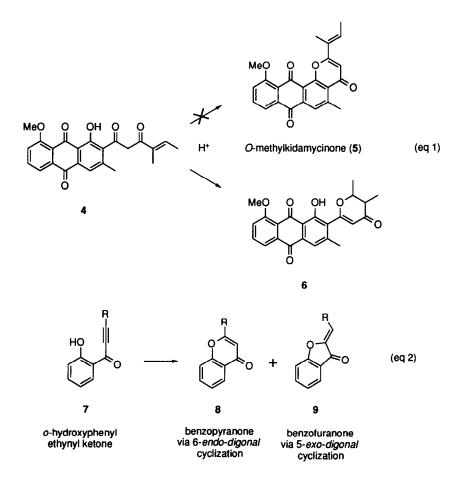

Abstract: The cyclization of o-hydroxyphenyl ethynyl ketones was examined from theoretical and experimental standpoints in order to develop efficient synthetic methods for the construction of 2-substituted pyranones possessing significant biological activities. Ab initio studies at HF/6-31G\* level on the cyclization indicated that both 6-endodigonal and 5-exo-digonal cyclizations giving benzopyranones and benzofuranones, respectively, were endothermic and reversible in aprotic media, and the irreversible protonation of the resulting anions would be critical for the products formation. We generated phenoxide ion under aprotic conditions in situ by desilylation of o-silyloxyphenyl ethynyl ketones with spray dried potassium fluoride and 18-crown-6 in anhydrous DMF. Under these conditions the cyclization of variety o-hydroxyphenyl ethynyl ketones proceeded smoothly to produce benzopyranone derivatives with exceedingly high selectivity. Theoretical and experimental results groupy suggested that the presence of a small amount of proton donor effecting the protonation of the resulting benzopyranone anion was essential for the high 6-endo-endo-endo-digonal selectivity. #### **INTRODUCTION**

Kapurimycin A<sub>3</sub> (1) is an antitumor antibiotic possessing a novel anthra- $\gamma$ -pyrone ring system with a vinyl epoxide side chain at the C2 position.<sup>1</sup> The structure of 1 is closely resembled to those of pluramycin family antibiotics,<sup>2</sup> which have a common 4*H*-anthra[1,2-*b*]pyrane ring system and characteristic functionalities attached to the C2 position as well as deoxyamino sugars at C8 and C10 positions. Pluramycin A (2),<sup>3</sup> hedamycin (3)<sup>4</sup> and 1 all having epoxide functionalities on the side chain attached to the C2 position are known to covalently bound to DNA by a nucleophilic ring opening of the epoxide with guanine N7 in DNA.<sup>5-8</sup>

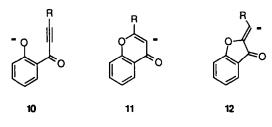

In spite of the significant biological features and unique reactivity toward DNA, the structure-activity relationships on these antibiotics was not examined primarily due to the difficulty in the synthesis of 2-substituted benzopyranone ring system.<sup>9,10</sup> For example, this problem has been addressed by the synthesis of *O*-methylkidamycinone (5) (eq 1),<sup>9</sup> showing that conventional synthetic scheme for benzopyranone systems using acid-catalyzed cyclization of 1-(*o*-hydroxyphenyl)-1,3-diketones<sup>11,12</sup> (*e.g.*, 4) is not applicable to the synthesis of these antibiotics because of the competitive formation of undesired dihydropyranone (*e.g.*, 6).

To investigate structure-activity relationship of these antibiotics we focused our attention on developing efficient synthetic methods for 2-substituted benzopyranone ring systems from readily available precursors. As a candidate for such a process, the 6-endo-digonal cyclization of o-hydroxyphenyl ethynyl ketones was first examined (eq 2), because the starting phenyl ethynyl ketones could be readily synthesized from salicylic aldehyde and acetylenic compounds. According to the Baldwin's rule<sup>13</sup> the 6-endo-digonal cyclization is a favorable process, although the cyclization of o-hydroxyphenyl ethynyl ketones 7 under basic conditions are reported to produce not only benzopyranone 8 via the 6-endo-digonal cyclization but also benzofuranone 9 by a simultaneous 5-exo-digonal cyclization, with the product ratio being highly dependent on the reaction

conditions.<sup>14–16</sup> To get insight into the factors governing the 6-endo-digonal and the 5-exo-digonal cyclization of o-hydroxyphenyl ethynyl ketones, we have investigated this reaction from theoretical and experimental viewpoints. We herein describe experimental results in combination with theoretical calculations indicating that both 6-endo-digonal and 5-exo-digonal cyclizations of o-hydroxyphenyl ethynyl ketones are reversible in aprotic media, and that the irreversible protonation of the resulting vinyl anion gives rise to the benzopyranone formation with exceedingly high selectivity.<sup>17</sup>

(For calculation studies R denotes Me)

#### **RESULTS AND DISCUSSION**

Theoretical Calculations for 6-Endo-digonal and 5-Exo-digonal Cyclizations.

To discuss the cyclization of o-hydroxyphenyl ethynyl ketone in detail, ab initio molecular orbital calculations of phenoxide ion 10, vinyl anions 11 and 12 (where R denotes Me), and two transition states TS-6 and TS-5 for the 6-endo-digonal and 5-exo-digonal cyclizations, respectively, were carried out.<sup>18,19</sup> While in our preliminary communication<sup>17</sup> we reported the theoretical calculations at the HF/3-21G(\*) level, more accurate calculations at higher HF/6-31G\* level were performed at this time for precise discussions. For these calculations the initial structures for 10, 11, and 12 were surveyed at the semiempirical PM3 level. Two stable s-trans and s-cis conformers were found for 10, with the former being more stable than the latter by 1.80 kcal/mol. Therefore, the s-trans conformer of 10 shown in Figure 1 was used for further calculations.<sup>20</sup> While the reaction of nucleophiles to the carbon-carbon triple bond may proceed via either syn or anti addition, 19d,21 the E-configuration for the exocyclic alkene in 12 supported by previous theoretical studies 19b,c was used for the calculation. We could not develop a reasonable transition state model for the syn addition of the phenoxide ion in 10 to the carbon-carbon triple bond via the 5-exo-digonal cyclization. These structures obtained by the PM3 calculations were optimized at the HF/3-21G(\*) and then at the HF/6-31G\* level. Two transition states TS-6 and TS-5 were initially generated empirically using the transition structure module incorporated in Spartan<sup>18</sup> and finally calculated at the HF/6-31G\* level. Frequency analyses for TS-6 and TS-5 showed the only one imaginary vibrational frequency at 524.62i and 525.25i cm<sup>-1</sup>, respectively (Figure 1) (For selected structural parameters, see experimental section).<sup>22</sup> In both structures the approaching angle of the phenoxide ion to the carbon-carbon triple bond was 115.4° and 118.9°, respectively. The potential energy diagram for the reaction of 10 to 11 and 12 was shown in Figure 2. The potential energies of two transition states TS-6 and TS-5 were very close in each other, therefore there was no obvious difference in the activation energies for the two cyclization processes (23.60 kcal/mol for  $\Delta G^{\ddagger}_{10\rightarrow 11}$  and 24.22 kcal/mol for  $\Delta G^{\ddagger}_{10\rightarrow 12}$ ). On the other hand, the produced vinyl anion 11 was more stable than anion 12 by 7.26 kcal/mol. As a result the activation energy for the ring-opening reaction of 12 to 10 (6.38 kcal/mol) was substantially smaller than that for the

#### K. NAKATANI et al.

conversion of 11 to 10 (13.02 kcal/mol). Since both cyclization reactions were shown to be endothermic processes, the irreversible protonation of the resulting anions 11 and 12 would be critical for the product formation. These theoretical results led to the following speculations for the cyclization of 10: 1) under kinetically controlled conditions the selectivity for the 6-*endo-digonal* cyclization would not be so high, and 2) under thermodynamic conditions the product formation is favorable for the 6-*endo-digonal* process, if all three anions were equilibrated and the selective protonation of 11 proceeded irreversibly.

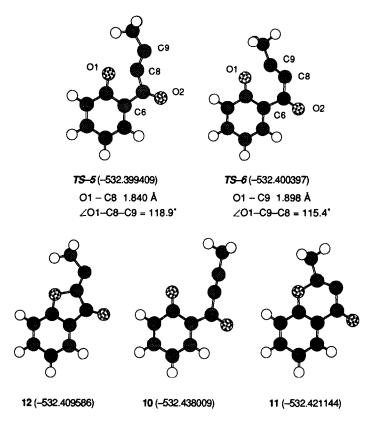

Figure 1. Optimized structures for 10, 11, 12, TS-6, and TS-5 at the HF/6-31G\* level. Numbers in parenthesis indicated the total energy in hartree.

#### Synthesis of o-Silyloxyphenyl Ethynyl Ketones.

To achieve thermodynamically controlled reaction conditions for the selective 6-endo-digonal cyclization, we examined *in situ* generation of the phenoxide in an aprotic medium by desilylation of o-silyloxyphenyl ethynyl ketone with fluoride. The o-silyloxyphenyl ethynyl ketone 16 used for the cyclization studies was synthesized from the silyl-protected salicylic aldehyde 13 and readily available 14 (Scheme 1). Addition of bromomagnesium salt 14 to 13 gave benzyl alcohol 15. Oxidation of 15 with manganese dioxide (MnO<sub>2</sub>) cleanly produced ethynyl ketone 16. Desilylation of 15 followed by oxidation with MnO<sub>2</sub> produced phenol 18.

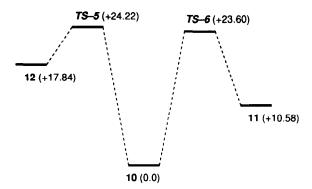

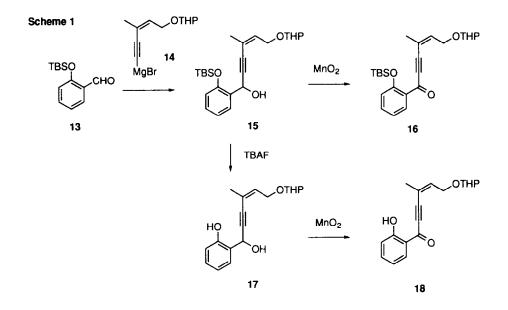

Figure 2. Potential energy diagram for the reaction of 10 to 11 and 12. Numbers in parenthesis indicated the relative potential energy from 10 in kcal/mol.

Effects of Reaction Conditions for The 6-Endo-digonal Cyclization.

Various reaction conditions for the 6-*endo-digonal* cyclization were tested by using 16. Considering that the protonation of the vinyl anion is essential for the product formation, we first examined the commercially available THF solution of tetra-n-butylammonium fluoride (TBAF) containing approximately 5% (v/v) of water as a fluoride ion source. The reaction of 16 with TBAF in THF at 0 °C for 1.5 h produced both 19 and 20 in 90% yield with very low selectivity (19:20 = 47:53) (eq 3). In the early stage of the reaction the phenol 18 was detected on TLC indicating the existence of phenoxide ion under the conditions, which slowly underwent cyclization to 19 and 20. The structure of 19 was unambiguously confirmed by the HMBC spectrum indicating

K. NAKATANI et al.

the hydrogen-carbon connectivities as shown in Figure 3. The stereochemistry of the exocyclic alkene in 20 was not confirmed by spectroscopic methods, but transition state for the 5-exo-digonal cyclization (TS-5) may suggest the preferential formation of Z-isomer. To reduce the concentration of proton donor (e.g., water) in the reaction system, spray-dried potassium fluoride (KF) in the presence of 18-crown-6 was used for the fluoride source. The reaction of 16 with spray dried KF-18-crown-6 in anhydrous DMF proceeded smoothly giving 19 as a sole product in a quantitative yield (97%). The formation of 20 was not detected by <sup>1</sup>H NMR analysis of the crude mixture.

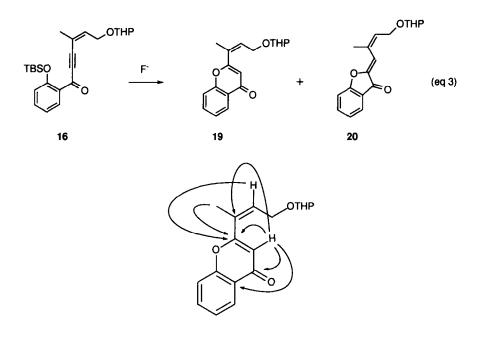

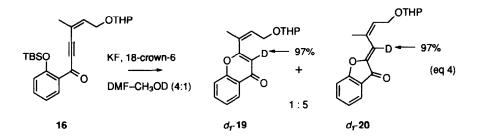

Figure 3. The selected hydrogen-carbon conectivities observed in the HMBC spectram of 19.

To confirm the speculation that irreversible protonation of the vinyl anion is essential for the product formation, the reaction of 16 under KF–18-crown-6–DMF conditions was quenched with deuterated acetic acid  $(CH_3CO_2D)$  after the standard reaction period (2 h) at ambient temperature. As expected there was no sign of the incorporation of the deuterium into 19, presumably due to *in situ* quenching of the resulting anion by moisture already contaminated in the reaction system. The observation that the cyclization of 16 became exceedingly slow when the reaction was carried out in the presence of the activated molecular sieves 4A, may support *in situ* protonation of the resulting anion. On the other hand, the addition of large excess of methanol (20% v/v) to the reaction mixture dramatically changed the reaction course giving 20 in 66% yield accompanied by the minor formation of 19 (13%). The formation of the substantial amount of 20 (9%) along with 19 (83%) by the cyclization of phenol 18 under KF–18-crown-6–DMF conditions revealed that even the phenolic hydrogen could be effective as a proton donor in the cyclization to result in a decrease of the selectivity for the formation of 19. These results indicated that the presence of only a small amount of proton

donor like moisture in the reaction system plays a critical role not only in governing the selectivity but also in the smooth product formation. Evidence for the vinyl anion formation in the cyclization of 16 was obtained when the cyclization was carried out in DMF-CH<sub>3</sub>OD (99 atom % D) (4:1) solution (eq 4). Both  $d_1$ -19 and  $d_1$ -20 formed in a ratio of 1:5 contained deuterium at the exocyclic olefinic position with the deuterium incorporation efficiency being more than 97% in both cases.

The time-course of the cyclization of 16 was monitored by <sup>1</sup>H NMR spectroscopy. The reaction mixtures of 16 under KF-18-crown-6-DMF conditions at -20 °C were subjected to aqueous work-up at an indicated time interval and the <sup>1</sup>H NMR of each of the crude mixture was recorded (Figure 4). The starting material 16 was no more detected after 10 min reaction, with phenol 18, benzopyranone 19, and benzofuranone 20 being observed in a ratio of 29:52:19 (line b). While after 30 min the ratio of three compounds reached to 9:54:37 (line c), upon prolonged reaction (1 h) phenol 18 was completely consumed, with the ratio of 19 and 20 being 81:19 (line d). Warming the reaction mixture to 0 °C followed by aqueous work-up resulted in an almost exclusive formation of 19 (line e). The fact that the amount of the initially formed benzofuranone 20 decreased on a prolonged reaction with increase of benzopyranone 19 suggested that there was an equilibrium among either 18, 19, and 20 or their anions.

To identify the stage for the equilibration, we examined the interconversion between 19 and 20 under KF-18-crown-6-DMF conditions and found that both compounds were absolutely inert at ambient temperature under the conditions.<sup>23</sup> It was also confirmed that pentacoordinate silicate having strong Lewis acidity formed *in situ* in the reaction did not induce the ring opening of 20. Thus, the reaction of a mixture of 16 and 20 (approximately 1:1) under KF-18-crown-6-DMF conditions afforded 19 with a complete recovery of 20 (eq 5). These experiments clearly indicated that protonation of benzopyranone and benzofuranone anions (e.g., 11 and 12, respectively) was an irreversible process under the conditions, and the equilibration should, therefore, exist at anion states. When the reaction of 16 under the KF-18-crown-6-DMF conditions was quenched with D<sub>2</sub>O before the equilibration is completed (e.g., after 15 min at -20 °C), it was confirmed that deuterium is efficiently incorporated into the exocyclic alkenic position of benzofuranone, while it was not the case for the benzopyranone (Figure 5). Thus, under these conditions protonation of the benzofuranone anion by a small amount of proton donor existing in the reaction system was much less efficient than that of benzopyranone anion.

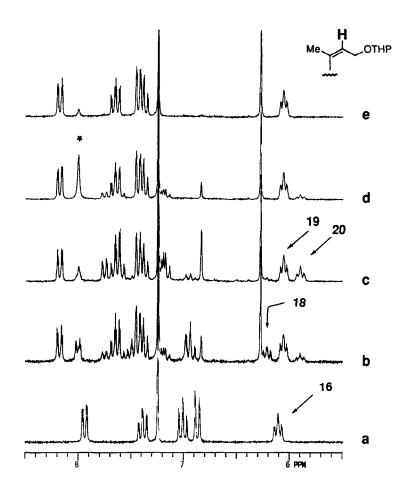

Figure 4. Selected <sup>1</sup>H NMR spectra (5.5 – 8.5 ppm) of the crude mixture for the reaction of 16 under the KF-18-crown-6-DMF conditions after aqueous work-up (aq.  $NH_4CI$ ) at the indicated reaction time. The compounds were identified by the triplet-like signals of the olefinic hydrogen observed at 6.11 ppm for 16, 6.21 ppm for 18, 6.06 ppm for 19, and 5.90 ppm for 20. line a; 0 min, 16, line b; 10 min at -20 <sup>°</sup>C, line c; 30 min at -20 <sup>°</sup>C, line d; 1 h at -20 <sup>°</sup>C, line e; warming up to 0 <sup>°</sup>C after 1 h at -20 <sup>°</sup>C. \* DMF

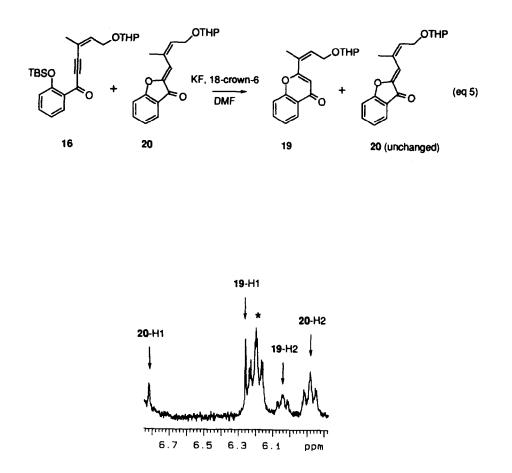

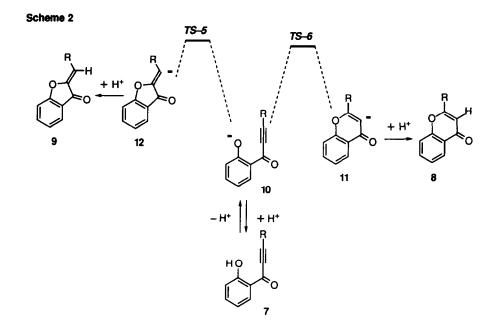

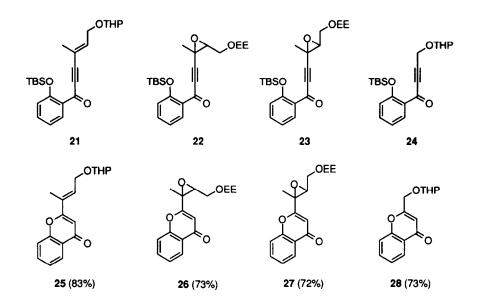

Figure 5. Selected <sup>1</sup>H NMR spectrum (5.8 – 6.9 ppm) of the crude mixture obtained by quenching the reaction of 16 under the KF–18-crown-6–DMF conditions with  $D_2O$ –ND<sub>4</sub>Cl after 15 min at –20 °C. The newly formed olefinic hydrogens for 19 and 20 were indicated as 19-H1 and 20-H1, respectively. Hydrogens attached to the trisubstituted alkene were labeled as 19-H2 and 20-H2. A small singla for 20-H1 in comparison with that for 20-H2 clearly indicated the incorporation of deuterium at this position. The signal marked with asterisk was the olefinic hydrogen of 18.

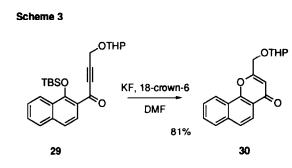

Considering theoretical calculations and the experimental results obtained above, we can rationalize the cyclization reaction of *o*-hydroxyphenyl ethynyl ketones under basic conditions as illustrated in Scheme 2. Under the conditions where there is a sufficient amount of proton donor, the reaction produces varying amounts of both benzopyranone and benzofuranone anions 11 and 12, which are protonated to give 8 and 9, respectively. On the other hand, under the conditions where only a limited amount of the proton donor was available, all three anions 10, 11, and 12 are equilibrated. The most stable phenoxide anion 10 would be expected to be preferentially protonated to give phenol 7. However, under the basic reaction conditions, 7, if formed, would be equilibrated with 10 immediately. While the protonation of the benzofuranone anion 12 was relatively slow under the conditions, the benzopyranone anion 11 was immediately and irreversibly protonated. As a result of the equilibrium among these three anions and of the irreversible protonation of 11, highly selective formation of benzopyranone 8 was attained. However, at this moment we do not know the reason why the protonation of 12 is relatively slow compared with that for 11.

#### Synthesis of Various 2-Substituted Benzopyranones.

With an efficient synthetic method for the selective formation of benzopyranones in hand, we examined the reaction of phenyl ethynyl ketones 21, 22, 23, and 24 under KF-18-crown-6-DMF conditions. The epoxysubstituted ketones 22 and 23 were synthesized using epoxy alkynes prepared from commercially available (Z)and (E)-3-methyl-2-penten-4-yn-1-ol, respectively, as detailed in experimental section. As expected benzopyranones 25, 26, 27, and 28 were selectively obtained in good to excellent yields as indicated in the parenthesis. The hydrolysis of THP group of 28 to the known 2-hydroxymethyl-4H-chromen-4-one gave further evidence for the structure.<sup>24</sup> Under these conditions the stereochemical integrity for the carbon-carbon double bond and the epoxide moiety was completely retained.

To examine the feasibility of this synthetic method for kapurimycin A<sub>3</sub> synthesis, we investigated the construction of tricyclic ring system as a simple kapurimycin model. Ethynyl ketone 29 was prepared from 1-silyloxy-2-naphthaldehyde according to the procedure described for the synthesis of 16. The cyclization of 29 under KF-18-crown-6-DMF conditions at ambient temperature proceeded smoothly giving the tricyclic compound 30 in 81% yield (Scheme 3). These results clearly indicated that our method has a high potential for the synthesis of 1 and its congeners to study the structure-reactivity relationship of kapurimycin A<sub>3</sub>. These studies are now actively in progress in these laboratories and will be reported in due course.

#### **EXPERIMENTAL SECTION**

General Procedures. Theoretical calculations were performed on SGI INDY (R4000SC personal workstation) with Spartan molecular modeling software (version 3.1) and Gaussian 92 program. <sup>1</sup>H NMR spectra were measured with Varian GEMINI 200 (200 MHz), JEOL JNM  $\alpha$ -400 (400 MHz) and JEOL JNM  $\alpha$ -500 (500 MHz) spectrometers. Coupling constants (J values) are reported in Hz. <sup>13</sup>C NMR spectra were measured with Varian GEMINI 200 (50 MHz), JEOL JNM  $\alpha\text{-}400$  (100 MHz) and JEOL JNM  $\alpha\text{-}500$  (125 MHz) spectrometers. The chemical shifts are expressed in ppm downfield from tetramethylsilane, using residual chloroform ( $\delta = 7.24$  in <sup>1</sup>H NMR,  $\delta = 77.0$  in <sup>13</sup>C NMR) and dimethylsulfoxide ( $\delta = 2.49$  in <sup>1</sup>H NMR,  $\delta$  = 39.5 in <sup>13</sup>C NMR) as an internal standard. The following abbreviations were used for the description of the signal multiplicity: s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; b, broad. IR spectra were recorded on a JASCO FT/IR-5M spectrophotometer. Melting points were obtained on a Yanagimoto Seisakusho micro melting point apparatus and are uncorrected. Electron impact mass spectra (MS) and high-resolution mass spectra (HRMS) were recorded on JEOL JMS-DX 300 or JEOL JMS-SX 102A. Pre-coated TLC plates Merck silica gel 60 F254 was used for monitoring the reactions and also for preparative TLC. Wako gel (C-200, particle size 75-150  $\mu$ m, Wako) was used for silica gel flash chromatography. Anhydrous reactions were performed under N<sub>2</sub> atmosphere. Ether and tetrahydrofuran (THF) were distilled under N<sub>2</sub> from sodium/benzophenone ketyl prior to use. Yields refer to chromatographically and spectroscopically (<sup>1</sup>H NMR) homogeneous materials, unless otherwise stated.

**2-(t-Butyldimethylsilyloxy)benzaldehyde (13).** To a solution of salicylaldehyde (1.21 g, 10.8 mmol) and 2,6-lutidine (1.75 mL, 15.0 mmol) in dichloromethane (30 mL) was added *t*-butyldimethylsilyl trifuluoromethanesulfonate (3.50 mL, 15.2 mmol) at -78 °C, and the mixture was stirred at -78 °C for 2 h. After diluted with sat. NaHCO<sub>3</sub> the reaction mixture was warmed to ambient temperature and extracted with ethyl acetate. The organic phase was washed with brine, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated *in vacuo*. The crude product was purified by flash chromatography (SiO<sub>2</sub>, 2% ethyl acetate/hexane) to give **13** (2.26 g, 89%) as a yellow oil: <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  10.45 (d, 1H, J = 1.0, 8.3 Hz), 1.00 (s, 9H), 0.26 (s, 6H); IR (CHCl<sub>3</sub>) 3016, 2957, 2932, 2860, 1684, 1600, 1478, 1256, 1217 cm<sup>-1</sup>; MS m/z (%) 179 [(M-'Bu)<sup>+</sup>] (56), 57 (100); HRMS calcd for C9H<sub>11</sub>O<sub>2</sub>Si [(M-'Bu)<sup>+</sup>], 179.0528; found, 179.0506.

### (Z)-1-[2-(t-Butyldimethylsilyloxy)phenyl]-4-methyl-6-(2-tetrahydropyranyloxy)-4-hexen-2-yn-1-ol

(15). To a solution of (Z)-3-methyl-2-penten-4-yn-1-ol (5.30 g, 55.1 mmol) and 3,4-dihydro-2H-pyran (15.0 mL, 164 mmol) in dichloromethane (60 mL) was added a catalytic amount of pyridinium p-toluenesulfonate (PPTS) at 0 °C, and the mixture was stirred for 3 h. The reaction mixture was diluted with sat. NaHCO3 and extracted with ethyl acetate. The organic phase was washed with brine, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated in vacuo. The crude product was purified by flash chromatography (SiO2, 10% ethyl acetate/hexane) to give (Z)-3-methyl-1-(2-tetrahydropyranyloxy)-2-penten-4-yne (9.78 g, 98%) as a vellow oil: <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>)  $\delta$  5.90 (m, 1H), 4.63 (dd, 1H, J = 3.1, 4.1 Hz), 4.38 (ddg, 1H, J = 1.4, 6.2, 12.6 Hz), 4.22 (ddq, 1H, J = 1.0, 7.2, 12.5 Hz), 3.87 (m, 1H), 3.50 (m, 1H), 3.13 (s, 1H), 1.88 (q, 3H, J = 1.3 Hz), 1.81 (m, 1H), 1.70 (m, 1H), 1.60-1.49 (4H); IR (CHCl<sub>3</sub>) 3305, 3010, 2948, 2855, 1442, 1202, 1118, 1023 cm<sup>-1</sup> <sup>1</sup>; MS m/z (%) 180 (M<sup>+</sup>) (0.8), 149 (4), 85 (100), 79 (57); Anal. Calcd for  $C_{11}H_{16}O_2$ : C, 73.30; H, 8.95. Found: C, 73.02; H, 8.95. To a solution of ethylmagnesium bromide (0.47 mL, 3 M in ethyl ether, 1.41 mmol) in THF (5 mL) was added a solution of the above acetylene compound (0.25 g, 1.40 mmol) in THF (2 mL) at 0 °C and the mixture was stirred at 50 °C for 1.5 h to give bromomagnesium salt 14. A solution of 13 (0.34 g, 1.44 mmol) in THF (2 mL) was added to the solution of 14 at ambient temperature and the whole mixture was stirred for 1 h. The reaction mixture was diluted with sat. NH4Cl and extracted with ethyl acetate. The organic phase was washed with brine, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated in vacuo. The crude product was purified by flash chromatography (SiO<sub>2</sub>, 15% ethyl acetate/hexane) to give 15 (0.37 g, 64 %) as a colorless oil: <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>)  $\delta$ 7.58 (ddd, 1H, J = 2.0, 2.6, 7.6 Hz), 7.18 (m, 1H), 6.96 (dt, 1H, J = 1.1, 7.5 Hz), 6.80 (d, 1H, J = 8.0 Hz), 5.84 (m, 2H), 4.65, 4.63 (tx2, total 1H, J = 3.6 Hz), 4.35–4.22 (2H),  $3.84 \text{ (m, 1H)}, 3.47 \text{ (m, 1H)}, 3.03, 2.97 \text{ (d} \times 2, \text{ total 1H}, J = 5.3 \text{ Hz}), 1.88 \text{ (d, 3H}, J = 0.8 \text{ Hz}), 1.80 \text{ (m, 1H)}, 1.69$ (m, 1H), 1.59–1.46 (4H), 1.02 (s, 9H), 0.26 (m, 6H); IR (CHCl<sub>3</sub>) 3430, 3011, 2953, 2860, 1480, 1454, 1258, 1021, 916, 840, 762 cm<sup>-1</sup>; MS m/z (%) 415 [(M–H)<sup>+</sup>] (2), 398 [(M–H<sub>2</sub>O)<sup>+</sup>] (3), 314 (46), 257 (98), 85 (66), 75 (98), 85 (66), 75 (98), 85 (66), 75 (98), 85 (66), 75 (98), 85 (66), 75 (98), 85 (66), 75 (98), 85 (66), 75 (98), 85 (66), 75 (98), 85 (66), 75 (98), 85 (66), 75 (98), 85 (66), 75 (98), 85 (66), 75 (98), 85 (66), 75 (98), 85 (66), 75 (98), 85 (66), 75 (98), 85 (66), 75 (98), 85 (66), 75 (98), 85 (98), 85 (66), 75 (98), 85 (98) (100); Anal. Calcd for C<sub>24</sub>H<sub>36</sub>O<sub>4</sub>Si: C, 69.19; H, 8.71. Found: C, 69.05; H, 8.64.

(Z)-1-[2-(*t*-Butyldimethylsilyloxy)phenyl]-4-methyl-6-(2-tetrahydropyranyloxy)-4-hexen-2-yn-1-one (16). To a solution of 15 (0.92 g, 2.20 mmol) in dichloromethane (30 mL) was added manganese (IV) oxide (2.0 g) and the mixture was stirred for 3 h at ambient temperature. The reaction mixture was diluted with ethyl ether, filtered, and concentrated *in vacuo*. The crude product was purified by flash chromatography (SiO<sub>2</sub>, 15% ethyl acetate/hexane) to give 11 (0.89 g, 97%) as a yellow oil: <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>)  $\delta$  7.93 (dd, 1H, J = 1.7, 7.8 Hz), 7.38 (ddd, 1H, J = 1.8, 7.3, 8.3 Hz), 7.00 (m, 1H), 6.87 (dd, 1H, J = 0.8, 8.3 Hz), 6.11 (m, 1H), 4.62 (dd, 1H, J = 3.1, 4.2 Hz), 4.43 (ddq, 1H, J = 1.3, 6.2, 12.9 Hz), 4.28 (ddd, 1H, J = 1.0, 7.3, 12.8 Hz), 3.83 (m, 1H), 3.46 (m, 1H), 1.97 (d, 3H, J = 1.2 Hz), 1.79 (m, 1H), 1.69 (m, 1H), 1.57–1.50 (4H), 0.99 (s, 9H), 0.21 (s, 6H); IR (CHCl<sub>3</sub>) 3012, 2952, 2860, 2189, 1643, 1478, 1447, 1257, 1233, 1022, 914, 841, 772, 759, 748 cm<sup>-1</sup>; MS m/z (%) 357 [(M–JBu)<sup>+</sup>] (26), 273 (100), 235 (98), 85 (74).

(Z)-1-(2-Hydroxyphenyl)-4-methyl-6-(2-tetrahydropyranyloxy)-4-hexen-2-yn-1-ol (17). To a solution of 15 (33.5 mg, 80.4  $\mu$ mol) in THF (1 mL) was added TBAF (80 mL, 1.0 M in THF, 80.0  $\mu$ mol) at 0 °C and the mixture was stirred at ambient temperature for 20 min. The reaction mixture was diluted with sat. NH4Cl and extracted with ethyl acetate. The organic phase was washed with brine, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated *in vacuo*. The crude product was purified by flash chromatography (SiO<sub>2</sub>, 15% ethyl acetate/hexane) to give 16 (23.0 mg, 95%) as a yellow oil: <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  7.31 (m, 1H), 7.21 (m, 1H), 6.90–6.85 (2H), 5.89 (m, 1H), 5.75 (d, 1H, J = 8.0 Hz), 4.72 (t×2, total 1H, J = 3.2 Hz),

4.35–4.21 (2H), 3.86 (m, 1H), 3.51 (m, 1H), 1.90 (s, 3H), 1.84–1.46 (8H); IR (CHCl<sub>3</sub>) 3356, 3015, 2949, 2927, 1487, 1234, 1021 cm<sup>-1</sup>; MS m/z (%) 284 [(M-H<sub>2</sub>O)<sup>+</sup>] (7), 200 (97), 171 (38), 84 (91), 55 (100).

(Z)-1-(2-Hydroxyphenyl)-4-methyl-6-(2-tetrahydropyranyloxy)-4-hexen-2-yn-1-one (18). To a solution of 17 (11.9 mg, 39.4  $\mu$ mol) in dichloromethane (1 mL) was added manganese (IV) oxide (50.0 mg) and the mixture was stirred for 4 h at ambient temperature. The reaction mixture was diluted with ethyl ether, filtered and concentrated *in vacuo*. The crude product was purified by flash chromatography (SiO<sub>2</sub>, 25% ethyl acetate/hexane) to give 18 (10.2 mg, 86%) as a yellow oil: <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>)  $\delta$  11.67 (s, 1H), 8.00 (dd, 1H, J = 1.7, 8.0 Hz), 7.49 (ddd, 1H, J = 1.7, 7.1, 8.5 Hz), 6.97 (m, 1H), 6.93 (ddd, 1H, J = 1.1, 7.3, 8.0 Hz), 6.21 (m, 1H), 4.66 (dd, 1H, J = 3.1, 4.2 Hz), 4.48 (ddq, 1H, J = 1.3, 6.4, 13.0 Hz), 4.33 (ddd, 1H, J = 1.1, 7.3, 13.0 Hz), 3.87 (ddd, 1H, J = 3.1, 8.3, 11.4 Hz), 3.51 (m, 1H), 2.03 (q, 3H, J = 1.3 Hz), 1.81 (m, 1H), 1.72 (m, 1H), 1.62–1.49 (4H); IR (CHCl<sub>3</sub>) 2949, 2191, 1624, 1597, 1243, 1022 cm<sup>-1</sup>; MS m/z (%) 300 (M<sup>+</sup>) (0.2), 273 (3), 216 (13), 173 (31), 121 (44), 85 (100).

(Z)-2-[1-(2-Tetrahydropyranyloxy)buten-3-yi]-4H-chromen-4-one (19). To a solution of 16 (20.3 mg, 49.0  $\mu$ mol) and 18-crown-6 (26.2 mg, 99.1  $\mu$ mol) in N,N-dimethylformamide (1 mL) was added spray dried potassium fluoride (5.7 mg, 98.1  $\mu$ mol) at 0 °C and the mixture was stirred at ambient temperature for 2 h. The reaction mixture was diluted with sat. NH<sub>4</sub>Cl and extracted with ethyl acetate. The organic phase was washed with brine, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated *in vacuo*. The crude product was purified by flash chromatography (SiO<sub>2</sub>, 15% ethyl acetate/hexane) to give 19 (14.2 mg, 97 %) as a yellow oil: <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>)  $\delta$  8.17 (ddd, 1H, J = 0.5, 1.7, 7.9 Hz), 7.65 (ddd, 1H, J = 1.7, 7.2, 8.4 Hz), 7.43 (ddd, 1H, J = 0.5, 1.1, 8.4 Hz), 7.38 (ddd, 1H, J = 1.0, 7.0, 8.0 Hz), 6.28 (s, 1H), 6.06 (m, 1H), 4.65 (m, 1H), 4.62 (ddq, 1H, J = 1.7, 5.7, 14.5 Hz), 4.41 (ddq, 1H, J = 1.4, 6.2, 14.3 Hz), 3.85 (m, 1H), 3.49 (m, 1H), 2.09 (q, 3H, J = 1.5 Hz), 1.81 (m, 1H), 1.72 (m, 1H), 1.60–1.51 (4H); <sup>13</sup>C NMR (50 MHz, CDCl<sub>3</sub>)  $\delta$  178.7, 164.1, 156.3, 135.4, 133.9, 129.2, 125.8, 125.3, 123.9, 118.1, 110.7, 98.7, 65.0, 62.4, 30.5, 25.2, 21.0, 19.3; IR (CHCl<sub>3</sub>) 3013, 2949, 2873, 2855, 1649, 1642, 1567, 1444, 1383, 1212, 1132, 1024 cm<sup>-1</sup>; MS m/z (%) 300 (M<sup>+</sup>) (1), 216 (100) [(M–THP+H)<sup>+</sup>], 200 (77), 199 (75), 187 (63), 121 (83), 85 (79); HRMS calcd for C<sub>13</sub>H<sub>12</sub>O<sub>3</sub> [(M–THP+H)<sup>+</sup>], 216.0787; found, 216.0806.

**2-[2-Methyl-4-(2-tetrahydropyranyloxy)-2-butenylidenyl]benzofuran-3-one (20).** To a solution of 16 (14.4 mg, 34.7  $\mu$ mol) in THF (1 mL) was added a THF solution of TBAF (35  $\mu$ L, 1 M in THF, 35  $\mu$ mol) at 0 °C and the mixture was stirred for 90 min at that temperature. The reaction mixture was diluted with sat. NH4Cl and extracted with ethyl acetate. The organic phase was washed with brine, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated *in vacuo*. The crude product was purified by flash chromatography (SiO<sub>2</sub>, 25% ethyl acetate/hexane) to give **20** (5.0 mg, 48%) as a colorless oil accompanied with **19** (4.4 mg, 42%). **20**: <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  7.75 (ddd, 1H, J = 0.6, 1.4, 7.7 Hz), 7.61 (ddd, 1H, J = 1.4, 7.3, 8.5 Hz), 7.21 (dt, 1H, J = 0.7, 8.3 Hz), 7.17 (dt, 1H, J = 0.7, 8.4 Hz), 6.83 (d, 1H, J = 0.9 Hz), 5.90 (m, 1H), 4.66 (dd, 1H, J = 3.1, 4.3 Hz), 4.46 (ddq, 1H, J = 1.4, 6.4, 13.3 Hz), 4.26 (ddq, 1H, J = 1.1, 7.3, 13.3 Hz), 3.89 (m, 1H), 3.54 (m, 1H), 2.24 (q, 3H, J = 1.3 Hz), 1.82 (m, 1H), 1.72 (m, 1H), 1.64–1.48 (4H); <sup>13</sup>C NMR (50 MHz, CDCl<sub>3</sub>)  $\delta$  185.14, 166.28, 147.29, 136.99, 135.70, 132.46, 124.71, 123.36, 121.66, 112.96, 109.62, 98.38, 63.44, 62.31, 30.42, 25.23, 22.51, 19.29; IR (CHCl<sub>3</sub>) 3020, 2947, 1717, 1606, 1462, 1300, 1129, 1031 cm<sup>-1</sup>; MS m/z (%) 216 [(M–THP+H)+] (23), 185 (37), 134 (100).

Internal quenching with DMF-CH<sub>3</sub>OD. The reaction of 16 (33.3 mg, 0.08 mmol) with KF (9.3 mg, 0.15 mmol), 18-crown-6 (44.6 mg, 0.17 mmol) in DMF (2 mL) and CH<sub>3</sub>OD (0.5 mL, 99 atm % D) was carried

out for 10 min at ambient temperature and worked-up as usual. Integration of the signal at 6.83 ppm for 20 in <sup>1</sup>H NMR showed the deuterium content of the produced 20 was 97%. More than 97% deuterium content for 19 was determined by the disappearance of the olefinc hydrogen in <sup>1</sup>H NMR. Chromatographic separation afforded  $d_I$ -19 (2.7 mg, 11%) and  $d_I$ -20 (11.6 mg, 48%).  $d_I$ -19: MS m/z (%) 301 (1) (M<sup>+</sup>), 217 (100) [(M–THP+H)<sup>+</sup>], 202 (79), 201 (80), 188 (56); HRMS calcd for C<sub>13</sub>H<sub>11</sub>O<sub>3</sub>D<sub>1</sub> [(M–THP+H)<sup>+</sup>], 217.0849; found, 217.0769.  $d_I$ -20: MS m/z (%) 301 (1) (M<sup>+</sup>), 217 (28) [(M–THP+H)<sup>+</sup>], 186 (41); HRMS calcd for C<sub>13</sub>H<sub>11</sub>O<sub>3</sub>D<sub>1</sub> [(M–THP+H)<sup>+</sup>], 217.0849; found, 217.0779.

Time-course of the cyclization of 16 (Figure 4). Four reactions of 16 under the standard KF-18-crown-6-DMF conditions (see the procedure for preparation of 19) were carried out at -20 °C, and three of four reactions were quenched by adding aq. NH<sub>4</sub>Cl after 10, 30, and 60 min at that temperature. The reamining reaction was warmed up to 0 °C after 60 min at -20 °C and quenched as previous. Each reaction mixture was extracted as for the preparation of 19 to give a crude mixture, which was analyzed by <sup>1</sup>H NMR in CDCl<sub>3</sub>.

**Cyclization of 16 in the presence of 21.** In a NMR tube a solution of DMF- $d_7$  (1 mL) containing **16** (5.0 mg, 0.012 mmol), **21** (3.6 mg, 0.012 mmol), and 18-crown-6 (12.8 mg, 0.048 mmol) was prepared and <sup>1</sup>H NMR of the starting mixture was recorded. To the solution was added KF (2.8 mg, 0.048 mmol) at room temperature and the mixture was sonicated for 10 min. <sup>1</sup>H NMR spectrum of the resulting dark brown solution was then recorded.

 $D_2O$  quenching before the equilibration is completed (Figure 5). The reaction of 16 described for the time-course experiment was quenched by adding  $D_2O-ND_4Cl$  solution after 15 min at -20 °C. The resulting mixture was worked-up as usual and <sup>1</sup>H NMR spectrum of the crude product was recorded in CDCl<sub>3</sub>.

(E)-1-[2-(t-Butyldimethylsilyloxy)phenyl]-4-methyl-6-(2-tetrahydropyranyloxy)-4-hexen-2-yn-1-one (21). According to the method described in the synthesis of 15 the reaction of (E)-3-methyl-2-penten-4-yn-1-ol (5.29 g, 55.0 mmol) gave (E)-3-methyl-1-(2-tetrahydropyranyloxy)-4-pentyn-2-ene (7.87 g, 79%) as a colorless oil: <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  6.04 (m, 1H), 4.61 (m, 1H), 4.26 (dd, 1H, J = 6.2, 13.2 Hz), 4.09 (dd, 1H, J = 7.2, 13.2 Hz), 3.84 (m, 1H), 3.50 (m, 1H), 2.80 (s, 1H), 1.82 (s, 3H), 1.80–1.48 (m, 6H); IR (CHCl<sub>3</sub>) 3306, 3012, 2948, 2855, 1442, 1200, 1119, 1024 cm<sup>-1</sup>; MS m/z (%) 180 (M<sup>+</sup>), (4), 149 (11), 85 (100); Anal. Calcd for C11H16O2: C, 73.30; H, 8.95. Found C, 73.45; H, 9.01. This compound (1.24 g, 6.87 mmol) was treated with EtMgBr as described in the synthesis of 15 to give the corresponding bromomagnesium salt, which was reacted with 13 (1.36 g, 5.74 mmol) to afford (E)-1-[2-(t-butyldimethylsiloxy)phenyl]-4-methyl-6-(2tetrahydropyranyloxy)-2-hexyn-4-en-1-ol (1.34 g, 55% based on 13) as a colorless oil: <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  7.56 (dd, 1H, J = 1.8, 7.7 Hz), 7.18 (ddd, 1H, J = 1.8, 7.4, 8.0 Hz), 6.96 (dt, 1H, J = 1.1, 7.5 Hz), 6.81 (dd, 1H, J = 1.1, 8.1 Hz), 5.98 (m, 1H), 5.80 (d, 1H, J = 5.5 Hz), 4.60 (m, 1H), 4.24 (dd, 1H, J = 6.2, 12.5 Hz), 4.10 (dd, 1H, J = 7.1, 13.2 Hz), 3.84 (m, 1H), 3.50 (m, 1H), 2.71 (d, 1H, J = 5.6 Hz), 1.83 (d, 3H, J = 1.5Hz), 1.81–1.49 (m, 6H), 1.02 (s, 9H), 0.29 and 0.26 (s×2, total 6H); IR (CHCl<sub>3</sub>) 3592, 3015, 2954, 2860, 1488, 1454, 1258, 1023, 912, 840, 745 cm<sup>-1</sup>; MS m/z (%) 359 [(M-/Bu)+], (3), 315 (12), 275 (19), 257 (35), 179 (100). Oxidation of this alcohol (1.16 g, 2.79 mmol) with MnO<sub>2</sub> (ca. 2 g) produced 21 (1.05 g, 91%) as a yellow oil: <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  7.90 (dd, 1H, J = 1.9, 7.8 Hz), 7.38 (ddd, 1H, J = 1.8, 7.2, 8.1 Hz), 7.00 (ddd, 1H, J = 1.1, 7.3, 7.8 Hz), 6.86 (dd, 1H, J = 1.1, 8.2 Hz), 6.29 (m, 1H), 4.62 (t, 1H, J = 3.4 Hz), 4.32 (ddq, 1H, J = 1.1, 6.1, 14.0 Hz), 4.15 (ddd, 1H, J = 0.9, 7.0, 13.9 Hz), 3.84 (ddd, 1H, J = 3.2, 8.3, 11.6 Hz),3.51 (m, 1H), 1.90 (d, 3H, J = 1.2 Hz), 1.80 (m, 1H), 1.70 (m, 1H), 1.62-1.49 (4H), 0.99 (s, 9H), 0.21 (s, 6H);

IR (CHCl<sub>3</sub>) 3016, 2953, 2860, 2190, 1642, 1478, 1448, 1256, 910, 840, 761 cm<sup>-1</sup>; MS m/z (%) 357 [(M-'Bu)<sup>+</sup>] (12), 273 (8), 245 (46), 203 (24), 179 (17), 149 (18), 85 (100).

(4R\*, 5R\*)-1-[2-(t-Butyldimethylsilyloxy)phenyl]-4,5-epoxy-6-(1-ethoxyethyloxy)-4-methyl-2-hexyn-1-one (22). To a solution of (Z)-3-methyl-2-penten-4-yn-1-ol (2.51 g, 26.2 mmol) and Na<sub>2</sub>HPO<sub>4</sub> (9.06 g, 63.8 mmol) in dichloromethane (100 mL) was added m-CPBA (9.08 g, 52.6 mmol) at 0 °C and the mixture was stirred at ambient temperature for 20 h. The mixture was diluted with sat. Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> and sat. NaHCO<sub>3</sub>, and extracted with ethyl acetate. The organic phase was washed with brine, dried over anhydrous Na2SO4, filtered, and concentrated in vacuo. The crude product was purified by flash chromatography (SiO<sub>2</sub>, 30% ethyl acetate/hexane) to give (2S\*, 3R\*)-2,3-epoxy-3-methyl-4-pentyn-1-ol (2.45 g, 84%) as a colorless needle: <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>)  $\delta$  3.91 (dd, 1H, J = 4.6, 12.3 Hz), 3.82 (dd, 1H, J = 6.2, 12.4 Hz), 3.08 (dd, 1H, J = 4.7, 6.1 Hz), 2.38 (s, 1H), 1.76 (br, 1H), 1.57 (s, 3H); IR (CHCl<sub>3</sub>) 3427, 3305, 3015, 1440, 1377, 1090 cm<sup>-1</sup>; Anal. Calcd for C<sub>6</sub>H<sub>8</sub>O<sub>2</sub>: C, 64.27; H, 7.19. Found C, 64.15; H, 7.10. To a solution of this epoxide (0.45 g, 4.00 mmol) and ethyl vinyl ether (0.77 mL, 8.05 mmol) in dichloromethane (4 mL) was added a catalytic amount of PPTS at 0 °C and the mixture was stirred at ambient temperature for 4 h. The reaction mixture was diluted with sat. NaHCO3 and extracted with ethyl acetate. The organic phase was washed with brine, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated in vacuo. The crude product was purified by flash chromatography (SiO<sub>2</sub>, 15% ethyl acetate/hexane) to give  $(2R^*, 3R^*)$ -2,3-epoxy-1-(1-ethoxyethoxy)-3-methyl-4-pentyne (0.65 g, 88%) as a colorless oil: <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  4.76 (q, 1H, J = 5.4 Hz), 3.85–3.62 (m, 3H), 3.48 (m, 1H), 3.06 (t, 1H, J = 5.4 Hz), 2.35 and 2.36 (s×2, total 1H), 1.55(s, 3H), 1.32 (dd, 3H, J = 5.4 Hz), 2.35 and 2.36 (s×2, total 1H), 1.55(s, 3H), 1.32 (dd, 3H, J = 5.4 Hz), 2.35 and 2.36 (s×2, total 1H), 1.55(s, 3H), 1.32 (dd, 3H, J = 5.4 Hz), 2.35 and 2.36 (s×2, total 1H), 1.55(s, 3H), 1.32 (dd, 3H, J = 5.4 Hz), 2.35 and 2.36 (s×2, total 1H), 1.55(s, 3H), 1.32 (dd, 3H, J = 5.4 Hz), 2.35 and 2.36 (s×2, total 1H), 1.55(s, 3H), 1.32 (dd, 3H, J = 5.4 Hz), 2.35 and 2.36 (s×2, total 1H), 1.55(s, 3H), 1.32 (dd, 3H, J = 5.4 Hz), 2.35 and 2.36 (s×2, total 1H), 1.55(s, 3H), 1.32 (dd, 3H, J = 5.4 Hz), 2.35 and 2.36 (s×2, total 1H), 1.55(s, 3H), 1.32 (dd, 3H, J = 5.4 Hz), 2.35 and 2.36 (s×2, total 1H), 1.55(s, 3H), 1.32 (dd, 3H, J = 5.4 Hz), 2.35 and 2.36 (s×2, total 1H), 1.55(s, 3H), 1.32 (dd, 3H, J = 5.4 Hz), 2.35 and 2.36 (s×2, total 1H), 1.55(s, 3H), 1.32 (dd, 3H, J = 5.4 Hz), 2.35 and 2.36 (s×2, total 1H), 1.55(s, 3H), 1.32 (dd, 3H, J = 5.4 Hz), 2.35 and 2.36 (s×2, total 1H), 1.55(s, 3H), 1.32 (dd, 3H, J = 5.4 Hz), 2.35 and 2.36 (s×2, total 1H), 1.55(s, 3H), 1.32 (dd, 3H, J = 5.4 Hz), 2.35 and 2.36 (s×2, total 1H), 1.55(s, 3H), 1.32 (dd, 3H, J = 5.4 Hz), 2.35 and 2.36 (s×2, total 1H), 1.55(s, 3H), 1.32 (dd, 3H, J = 5.4 Hz), 2.35 and 2.36 (s×2, total 1H), 1.55(s, 3H), 1.32 (dd, 3H, J = 5.4 Hz), 2.35 and 2.36 (s×2, total 1H), 2.55(s, 3H), 1.32 (dd, 3H, J = 5.4 Hz), 2.55(s, 3H), 2.55(s, 3 1.0, 5.4 Hz), 1.19 (t, 3H, J = 7.1 Hz); IR (CHCl<sub>3</sub>) 3272, 3260, 2980, 2934, 2878, 1134, 1060 cm<sup>-1</sup>; MS m/z (%) 169  $[(M-Me)^+]$ , (5), 95 (13), 73 (100); Anal. 1-[2-(1-t-Butyldimethylsiloxy)naphthyl]-4-(2-tetrahydropyranyloxy)-2-butyn-1-one (29). To a solution of ethylmagnesium bromide (3 M in ethyl ether, 0.26 ml, 0.78 mmol) in THF (4 mL) was added a solution of 1-(2-tetrahydropyranyloxy)-2-propyne (98.8 mg, 0.70 mmol) in THF (1 mL) at 0 °C and the mixture was stirred at 50 °C for 1 h. After the reaction mixture was cooled to ambient temperature, a solution of 2-(1-t-butyldimethylsilyloxy)naphthaldehyde (0.22 g, 0.77 mmol) in THF (1 mL) was added and the whole mixture was stirred at ambient temperature for 20 min. The mixture was diluted with sat. NH4Cl and extracted with ethyl acetate. The organic phase was washed with brine, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered, and

concentrated in vacuo. The crude product was purified by flash chromatography (SiO<sub>2</sub>, 15% ethyl acetate/hexane) to give 1-[2-(1-r-butyldimethylsiloxy)naphthyl]-4-(2-tetrahydropyranyloxy)-2-butyn-1-ol (162 mg, 54%) as a mixture of diastereoisomer as a yellow oil: <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  8.07 (1H), 7.77 (1H), 7.73 (d, 1H, J = 8.6 Hz), 7.54 (d, 1H, J = 8.6 Hz), 7.47–7.41 (2H), 6.00 (t, 1H, J = 1.7 Hz), 4.80 (t, 1H, J = 3.4Hz), 4.38-4.28 (2H), 3.81 and 3.72 (m×2, total 1H), 3.50 (m, 1H), 2.20 (br, 1H), 1.85-1.47 (6H), 1.13 and 0.90 (s×2, total 9H), 0.19 and 0.08 (s×2, total 6H); IR (CHCl<sub>3</sub>) 3020, 2953, 2860, 1374, 1260, 1213, 1088, 1024, 899, 841, 829, 785 cm<sup>-1;</sup> MS m/z (%) 426 (M<sup>+</sup>) (23), 285 (44), 267 (96), 193 (83), 85 (74), 69 (100); HRMS calcd for C25H34O4Si (M+) 426.2226; found, 426.2207. To a solution of this alcohol (63.6 mg, 0.15 mmol) in dichloromethane was added manganese (IV) oxide (100.0 mg) and the mixture was stirred for 36 h at ambient temperature. The reaction mixture was diluted with ethyl ether, filtered and concentrated in vacuo. The crude product was purified by flash chromatography (SiO<sub>2</sub>, 15% ethyl acetate/hexane) to give 29 (46.8 mg, 73%) as a yellow oil: <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  8.24 (m, 1H), 7.90 (d, 1H, J = 8.8 Hz), 7.78 (m, 1H), 7.56 (ddd, 1H, J = 8.8 Hz), 7.78 (m, 1H), 7.56 (ddd, 1H, J = 8.8 Hz), 7.78 (m, 1H), 7.56 (ddd, 1H, J = 8.8 Hz), 7.78 (m, 1H), 7.56 (ddd, 1H, J = 8.8 Hz), 7.78 (m, 1H), 7.56 (ddd, 1H), 7.5 J = 1.3, 6.9, 8.1 Hz), 7.49 (dd, 1H, J = 1.5, 8.4 Hz), 7.48 (m, 1H), 4.85 (t, 1H, J = 3.2 Hz), 4.50 (s, 2H), 3.84 (ddd, 1H, J = 3.2, 9.3, 12.1 Hz), 3.53 (m, 1H), 1.84-1.50 (m, 6H), 1.12 (s, 9H), 0.10 (s×2, 6H, J = 0.7 Hz); IR(CHCl<sub>3</sub>) 3021, 2952, 2932, 1649, 1619, 1395, 1231, 1122, 1027, 903, 827, 725 cm<sup>-1</sup>; MS m/z (%) 409 [(M-Me)+] (7), 367 (99), 283 (97), 267 (99), 239 (100); HRMS calcd for C24H29O4Si [(M-Me)+] 409.1835; found, 409.1826.

2-[(2-tetrahydropyranyloxy)methyl]-4H-naphtho[1,2-b]pyran (30). To a solution of 29 (89.5 mg, 0.21 mmol) and 18-crown-6 (137 mg, 0.52 mmol) in *N*,*N*-dimethylformamide (3 mL) was added a potassium fluoride (24.6 mg, 0.42 mmol) at 0 °C and the mixture was stirred at ambient temperature for 4 h. The reaction mixture was diluted with sat. NH4Cl, and extracted with ethyl acetate. The organic phase was washed with brine, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated *in vacuo*. The crude product was purified by flash chromatography (SiO<sub>2</sub>, 15% ethyl acetate/hexane) to give 30 (53.3 mg, 81%) as a yellow oil: <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  8.45 (m, 1H), 8.13 (d, 1H, *J* = 8.6 Hz), 7.92 (m, 1H), 7.76 (d, 1H, J = 8.6 Hz), 7.69 (m, 1H), 7.65 (m, 1H), 6.62 (s, 1H), 4.85 (t, 1H, *J* = 3.2 Hz), 4.78 (dd, 1H, *J* = 0.8, 14.7 Hz), 4.61 (d, 1H, *J* = 14.7 Hz), 3.90 (ddd, 1H, *J* = 3.1, 9.3, 12.4 Hz), 3.59 (m, 1H), 1.91–1.53 (6H); IR (CHCl<sub>3</sub>) 3021, 2358, 1652, 1212, 774 cm<sup>-1</sup>; MS m/z (%) 310 (M<sup>+</sup>) (100), 254 (38), 226 (61), 210 (98), 181 (85); HRMS calcd for C<sub>19</sub>H<sub>18</sub>O4 (M<sup>+</sup>) 310.1203; found, 310.1183.
