## THIYLATION OF DIVINYL SULFIDE AND ITS DERIVATIVES BY HYDROGEN SULFIDE IN Lioh/DMSO

G. K. Musorin and S. V. Amosova

UDC 542.97:547.379.1:546.221.1

We have found that  $H_2S$  in LiOH/DMSO reacts with divinyl sulfide and di(propen-1-yl) sulfide to form di- (I), tri- (II), and tetrasulfides (III) as well as 1,3-dithiolanes (IV).

$$R \xrightarrow{R} R^{1}S_{x}R^{1} + R^{2}S \xrightarrow{S} R^{3}$$

R = H;  $R^1 = Et$ ,  $R^2 = H$ ,  $R^3 = Me$ , x = 2 (Ia), 3 (IIa), 4 (IIIa), (IVa); R = Me;  $R^1 = Pr$ ,  $R^2 = Me$ ,  $R^3 = Et$ , x = 2 (Ib), 3 (IIb), 4 (IIIb), (IVb).

The addition of  $\rm H_2S$  or its disproportionated form, disulfane, to diallyl sulfide leads apparently to 1-propen-1-ylthio-1-propanethiol (V) and 1-propen-1-ylthio-1-propane hydrosulfide (VI). Intermediates (V) and (VI) in the LiOH-DMSO- $\rm H_2S$  oxidation-reduction system [1] may split to give propanethiol and propane hydrosulfide, which are oxidized to (I)-(III). Hemithioacetal (V) may also undergo intramolecular cyclization to form (IV), but this reaction is secondary in nature.

Hydrogen sulfide was rapidly passed into a mixture consisting of 10.2 g divinyl sulfide, 6.8 g LiOH and 150 ml DMSO at about  $20\,^{\circ}\text{C}$  for 4 h. The reaction mixture was diluted with water and extracted with ether. The ethereal extracts were dried over  $\text{CaCl}_2$ . Ether was distilled off. Vacuum distillation gave a fraction of 11.8 g which was analyzed by gas-liquid chromatography on a column packed with 15% Carbowax 20 M on Chromaton N-AW-DMCS. The distillate was found to contain 5.7 g (39.3%) (Ia), 3.7 g (20.2%) (IIa), 1.6 g (7.2%) (IIIa), and 0.8 g (5.6%) (IVa).

The reaction of di(propen-1-yl)sulfide with  $\rm H_2S$  under analogous conditions leads to 46.2% (Ib), 16.7% (IIb), and 6.3% (IVb). Product (IIIb) was detected in the mixture by chromatomass spectrometry. For structural study, the compounds were isolated by preparative gas-liquid chromatography on a 2 m  $\times$  6 mm column packed with 15% Carbowax 20 M on Chromaton N-AW-DMCS.

PMR spectrum in CDCl<sub>3</sub> ( $\delta$ , ppm, HMDS): 2.68 q, 2.87 q, 2.95 q, 2.66 t, 2.84 t, CH<sub>2</sub>S in (Ia), (IIIa), (Ib) and (IIb), respectively; 1.30 t, 1.37 t, 1.39 t, 0.98 t, 1.00 t, Me in (Ia), (IIIa), (IIIa), (Ib), and (IIb), respectively; 1.69 m, 1.77 m CH<sub>2</sub> in (Ib) and (IIb), respectively. The chemical shifts for the 1,3-dithiolanes were in accord with the data of Keskinen et al. [2].
