AN IMPROVED SYNTHESIS OF 4-METHYLENE-2-CYCLOHEXEN-1-ONE

Michael E. Jung^{*1} and Heather L. Rayle²

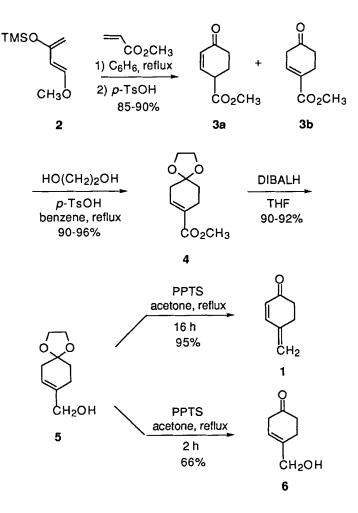

Department of Chemistry and Biochemistry, University of California, Los Angeles, California 90024

Abstract: An improved synthesis of 4-methylene-2-cyclohexen-1-one (1) is described, which involves four steps from commercially available starting materials and proceeds in 65-75% overall yield.

During studies in our laboratory which required the preparation of 4substituted cyclohexenones, we developed a novel synthesis of 4-methylene-2cyclohexen-1-one (1), which utilizes clean, high-yielding reactions. Compound 1 and its simple derivatives are valuable organic building blocks. In addition, by carrying out a 1,6-Michael addition to the exocyclic double bond, 4-substituted 3cyclohexenones and, by isomerization,³ 2-cyclohexenones are also available. This mode of reactivity has been exploited in a synthesis of the antibiotic anticapsin.⁴ We now report our high-yielding four-step synthesis of 1.

Only one synthesis of 1 has been reported to date.⁵ The procedure requires a Birch reduction of 4-methoxybenzyl alcohol, affording a mixture of the expected 1-(hydroxymethyl)-4-methoxy-1,4-cyclohexadiene and 1-methoxy-4-methyl-1,4-cyclohexadiene resulting from deoxygenation by reductive fission.^{5,6} In our hands, acidic hydrolysis produced a mixture of products, with 1 being obtained in 35-40% overall yield.

Our new route to 1 begins with the Diels-Alder reaction of Danishefsky's diene 2 with methyl acrylate, followed by normal acidic hydrolysis of the β methoxy silyl enol ether, to afford the keto esters 3 in 85-90% yield. The crude product consisted predominately of the 2-cyclohexenone 3a, which isomerized during column chromatography to a 3:1 mixture favoring 3b. Ketalization with ethylene glycol and p-toluenesulfonic acid completed double bond isomerization and provided 4 (90-96%); both steps may be performed in a one-pot reaction with no loss in yield.^{7,8} Reduction of the ester with DIBALH produced 5 (90-92%). This ketal, a useful intermediate in various syntheses, 6,9,10 has been prepared to date from the Birch reduction product of 4-methoxybenzyl alcohol, the disadvantages of which are described above. Our method also provides an improved preparation of this compound. Ketal deprotection with pyridinium ptoluenesulfonate (PPTS) in refluxing acetone for 16 h effected both ketal hydrolysis and dehydration of the allylic alcohol to afford 1 in 95% yield. Alternatively, brief treatment with mild acid provided the keto alcohol 6 in good yields. This improved procedure affords the dienone 1 in 65-75% overall yield from commercially available Danishefsky's diene 2.

Experimental Section

Nuclear magnetic resonance spectra (¹H, ¹³C NMR) were acquired on a Bruker AM-360 spectrometer. Resonances are reported in ppm (δ) downfield from tetramethylsilane. Infrared spectra were recorded using a Nicolet 510 spectrometer. Mass spectra were recorded on a VG Autospec mass spectrometer.

All reactions were performed in oven-dried glassware under an argon atmosphere. Tetrahydrofuran was distilled from sodium benzophenone ketyl; all other solvents were distilled from calcium hydride. Column chromatography¹¹

JUNG AND RAYLE

was performed using Merck silica gel 60 (70-230 mesh); thin-layer chromatography was performed using Merck 60 F_{254} plates.

Methyl 4-oxocyclohex-2-enecarboxylate (3a) and methyl 4-oxocyclohex-1enecarboxvlate (3b).¹² To a stirred solution of Danishefsky's diene 2 (1.2 g, 6.96 mmol) in 5 mL of benzene was added 1.25 mL methyl acrylate (1.2 g, 13.92 mmol). The solution was heated at reflux for 48 h. p-Toluenesulfonic acid (100 mg) was added to the cooled reaction, which was stirred until hydrolysis was complete as determined by TLC. Solvent and excess acrylate were removed by evaporation under reduced pressure. The crude product consisted primarily of 3a; the residue was then chromatographed (50% ethyl acetate/hexanes) to give 0.94 g (87%) of a 3:1 mixture of the keto esters 3b and 3a as a pale yellow oil. For 3a: ¹H NMR (CDCl₃) δ 7.03 (1H, dd, J = 10.2, 3.2 Hz), 6.04 (1H, dd, J = 10.2, 2.5 Hz.), 3.74 (3H, s), 3.42-3.36 (1H, m) and 2.6-2.15 (4H, m). ¹³C NMR (CDCl₃) δ 198.9, 172.7, 147.0, 131.4, 53.2, 42.2, 37.0, 26.2. IR (neat) 1752, 1680, 1645 cm⁻ ¹. For 3b: ¹H NMR (CDCl₃) δ 6.97 (1H, bt, J = 3.9 Hz), 3.73 (3H, s), 3.05 (2H, bd, J = 3.9 Hz), 2.8-2.3 (4H, m). ¹³C NMR (CDCl₃) δ 208.8, 167.2, 136.4, 131.1, 52.7, 40.2, 38.7, 24.9. IR (neat) 1720 (br), 1670 cm⁻¹. For both isomers: highresolution MS, *m/e* 154.0636, calcd for C₈H₁₀O₃ 154.0630.

Methyl 1,4-dioxaspiro-[4.5]dec-7-ene-8-carboxylate (4).^{7,8} Ethylene glycol (0.15 mL, 2.6 mmol) was added to the mixture of keto esters 3a and 3b (0.20 g, 1.3 mmol) and 25 mg *p*-toluenesulfonic acid in 2 mL benzene. The reaction was refluxed with azeotropic removal of water for 12 h. After cooling, benzene was added and the reaction mixture was washed with water and brine. The resulting solution was dried over anhydrous sodium sulfate and the solvent was evaporated to give 0.25 g of 4 (94%). The crude product was sufficiently pure for use, but

could be distilled using a Kugelrohr apparatus (bp 92-93°/0.8 mm Hg). ¹H NMR (CDCl₃) δ 6.85 (1H, t, J = 3.7 Hz), 3.97 (4H, s), 3.71 (3H, s), 2.52 (2H, t, J = 6.5 Hz), 2.43 (2H, d, J = 3.7 Hz), 1.79 (2H, t, J = 6.5 Hz). ¹³C NMR (CDCl₃) δ 168.0, 137.3, 130.5, 107.9, 65.2 (2C), 52.4, 36.9, 31.4, 24.3. IR (neat) 1717, 1653, 1260, 1119 cm⁻¹. High-resolution MS, *m/e* 198.0900, calcd for C₁₀H₁₄O₄ 198.0890.

The ketal was also prepared in one step by addition of ethylene glycol and p-toluene-sulfonic acid to the reaction mixture containing the silyl enol ether of 3; refluxing was continued for 16 h and the product was isolated as above in a 75% yield.

1,4-Dioxaspiro-[4.5]dec-7-ene-8-methanol (5).^{6,9,10} The ketal ester 4 (0.14 g, 0.70 mmol) was added to a solution of DIBALH (1.75 mL of a 1M solution in hexane) in 4 mL THF. The solution was stirred for 2 h and quenched with water. Magnesium sulfate was added to the residue, which was stirred for 0.5 h.¹³ Filtration and thorough washing of the aluminum salts with ether afforded pure 5 (0.11 g, 92%). The crude product was used for subsequent reactions. ¹H NMR (CDCl₃) δ 5.56 (1H, t, *J* = 1.3 Hz), 3.97 (2H, s), 3.95 (4H, s), 2.27 (1H, bs), 2.25 (2H, d, *J* = 1.3 Hz), 2.22 (2H, t, *J* = 6.5 Hz), 1.76 (2H, t, *J* = 6.5 Hz). ¹³C NMR (CDCl₃) δ 138.0, 120.5, 108.9, 67.2, 65.1 (2C), 36.1, 31.5, 25.5. IR (neat) 3434 (br), 1680, 1113, 1059 cm⁻¹. High-resolution MS, *m/e* 170.0938, calcd for C₉H₁₄O₃ 170.0943.

4-(Hydroxymethyl)-3-cyclohexen-1-one (6). The ketal 5 (0.10 g, 0.58 mmol) was refluxed with pyridinium *p*-toluenesulfonate (20 mg) in wet acetone for 2 h. Dichloro-methane was added, and the organic layer was washed with water and dried over Na₂SO₄. After evaporation of the solvent, the residue was

chromatographed (40% ethyl acetate/hexanes) to afford 48 mg of **6** (66%). No attempts at yield optimization were made. ¹H NMR (CDCl₃) δ 5.76 (1H, bs), 4.12 (2H, s), 2.90 (2H, bs), 2.51 (4H, m), 1.71 (1H, bs). ¹³C NMR (CDCl₃) δ 211.1, 138.8, 120.1, 66.7, 40.0, 39.1, 26.5. IR (CHCl₃) 3455, 1713-1674 (br) cm⁻¹. High-resolution MS, *m/e* 126.0683, calcd for C₇H₁₀O₂ 126.0681.

4-Methylene-2-cyclohexen-1-one (1). The ketal 5 (0.86 g, 0.50 mmol) was refluxed with pyridinium *p*-toluenesulfonate¹⁴ (30 mg) in wet acetone for 16 h. Ether was added to the cooled reaction, which was washed with water and brine to give pure 1 (52.4 mg, 96%) as a colorless oil. Further purification was unnecessary; analytical samples were purified by flash chromatography (40% ethyl acetate/hexanes). ¹H NMR (CDCl₃) δ 7.07 (1H, d, *J* = 9.9 Hz), 5.94 (1H, d, *J* = 9.9 Hz), 5.31 (1H, bs), 5.27 (1H, bs), 2.73 (2H, t, *J* = 6.8 Hz), 2.50 (2H, t, *J* = 6.8 Hz). ¹³C NMR (CDCl₃) δ 199.8, 148.1, 141.3, 128.8, 120.1, 37.9, 29.8. IR (neat) 3030 (w), 1673 (s), 1626 cm⁻¹. High-resolution MS, *m/e* 108.0577, calcd for C₇H₈O 108.0577.
