Keywords index- alkylating agent, carboxylsulfamides, chloroethylnitrososulfamides, chlorosulfonyl isocyanate, oxazolidinone, perhydrooxazinone, nitrogen mustard, nitrosation, oncostatic, transsulfamoylation.

Abstract

Starting from chlorosulfonyl isocyanate, successive addition of selected 1,2 and 1,3 haloalcohols, sulfamoylation with the nitrogen mustard and cyclization in alkaline conditions give title compounds in good yields. These sulfamoyloxazolidinones and sulfamoylperhydrooxazinones were revealed as efficient 2-chloroethylsulfamoyl donors in the 2-chloroethylnitrososulfamides synthesis; five new CENS (derivated from heterocyclic amines and amino acids) were thus synthezised. According to the experimental conditions, N-sulfamoylcyclocarbamates can be reopened by nucleophiles giving addition products by transcarbamoylation. Copyright © 1996 Elsevier Science Ltd

Introduction

In a previous reports [1-3] we have reported the syntheses and the promising oncostatic properties of the 2-chloroethylnitrososulfamides (CENS). The four-step approach for the preparation of CENS, described as an *insertion of sulfamoyl group* [4] was carried out in a 40-60 % overall yield starting from chlorosulfonyl isocyanate (CSI) and primary or secondary amines. In the perspective of the synthesis of a larger series, necessary for the pharmacomodulation studies and to establish QSAR, we have developed a *transsulfamoylation* alternative route, which would allow the direct access to the expected sulfamides through a shortened procedure (scheme 1). This reaction evolves from a nucleophilic exchange of a 5 or 6-membered heterocyclic leaving group by the required primary or secondary amine. The approach by the displacement of this activated group is commonly used in acyl transfer reactions [5-12], but no example was found in the sulfamoylated derivatives chemistry.

Scheme 1

Preparation of N-sulfamoyl-2-oxazolidinones and -1,3-perhydrooxazin-2-ones The synthesis of the N-carboxylsulfamides <u>1a-f</u> was carried out starting from chlorosulfonyl isocyanate, 1-2 or 1-3 haloalcohols, nitrogen mustard and triethylamine through a previously described [1] one-pot procedure in a 65-95 % yield. Haloalcohols used are chloro- and bromoethanol (a, a'), 1-chloro-2-propanol (b), 1,3-dichloro-2-propanol (c), 2,3-dibromo-1-propanol (d), 3chloro-1-propanol (e), and 2,2-dimethyl-3-chloro-1-propanol (f).

The cyclization of carboxylsulfamides (Fig 1; top) is achieved by triethylamine addition in quantitative yield [13-15]. Compounds <u>la-c</u> give N-sulfamoyl-2-oxazolidinones <u>2a-c</u> and compounds <u>le-f</u> give homologous perhydrooxazinones <u>3e-f</u> (Fig1; middle). Compounds <u>la-a'</u> and <u>lf</u> can be spontaneously cyclized during the first step (relating to the excellent leaving group character of Br for <u>la'</u>, and *gem*dimethyl effect for <u>lf</u>). The alkaline treatment of dibromopropylcarbamate <u>ld</u> affords both the 5 and 6-membered ring derivatives <u>2d</u> and <u>3d</u> in a 3:5 ratio. In this case, the structural determination was established by 1H-DEPT and 13C-NMR (experimental section). No cyclization is observed relating to the sulfamide group. Selected physicochemical and spectroscopic data concerning the obtained series 1, 2 and 3 are reported in the following Table.

The synthesis of N-nitrosated compounds starting from the mustard sulfamides <u>2a-d</u> and <u>3d-f</u> (scheme 2, bottom) can be only achieved by addition of nitrosyl chloride, or nitrosyl tetrafluoroborate in aqueous solution of LiOH. In other conditions (sodium nitrite in formic acid, NOCI, NOHSO₃, NOBF₄ in triethylamine) an equilibrium of nitrosation-denitrosation was observed in the reaction medium. The resulting derivatives <u>4a-d</u> and <u>5d-f</u> were unstable and kept under argon atmosphere at -20°C. Only device compounds (Fig 1; bottom) 4a and 5e could be characterized.

Transsulfamoylation

The assays of the direct transsulfamoylation starting from N-nitrosated derivatives 4 and 5 are however disappointing, giving decomposition products due to the excessive lability of these series of compounds. In contrast, the treatment of sulfamoyloxazolidinone by amines gave, in accordance with the experimental conditions reported in the scheme 2, two series resulting from both addition by transcarbamoylation (top) or substitution by transculfamoylation (bottom) reactions:

substitution by transsulfamoylation

Scheme 2

Two different mechanisms would be in fact involved. At r.t., the reaction proceeds through the nucleophilic attack on the carbonyl site giving the tetrahedral intermediate and the subsequent formation (route b) of the sulfonamide anion (more stable in this case than the oxanion in route a). Thus the resulting product of this addition by N to N'-acyl transfer is the sulfamide-carbamate. The structure of the obtained products 6 and 7, starting from benzylamine and sulfamoyloxazolidinone 2a or sulfamoyloxazinone 3e respectively, is clearly established with NMR, IR and MS data, versus the hypothetical isomer N-(2-hydroxyethyl)carbamoylsulfamide resulting to the route a. By prior heating with triethylamine in acetonitrile, the initial step would be the intermediary formation, through a concerted six-membered rearrangement, of the very reactive sulfonimide [16-18]. The subsequent addition of amine gives the expected chloroethylsulfamides. An excess of amine can be reacted with

8 (with benzylamine). Thus the experimental conditions can easily directed the selective formation of the desired series. By the transsulfamoylation procedure with selected amines such as benzylamine, pentylamine, pyrrolidine, morpholine, methyl phenylalaninate and ditertbutyl aspartate, the chloroethylsulfamides 9-14 are respectively recovered in variable yields according to the nature of heterocyclic leaving group (see experimental section).

Satisfactory results are obtained with compounds 2a, 2b, 3e and 3f as sulfamoylating agent and the best yields are observed with the primary amines derivatives. Using others donors (2c, 2d-3d) the experimental conditions were more tedious and by-products accompanied the waited compounds. CENS 15-20 were then respectively afforded from precursors 9-14 by the previously described method [1,2]. Relating to the pharmacomodulation described in the nitrosoureas series, the association of the pharmacophore CENS with the amino acids (19 and 20) is potentially interesting for an eventual vectorization [19-22]. By comparison with our previous works, the overall yield (starting from the utilized amine) is increased in a range 25-40%. In conclusion the N-sulfamoyl*cyclocarbamates* are efficient donors of sulfamoyl group in the two-step synthesis of CENS. Moreover in controlled experimental conditions, these key-compounds give opened carbamates-sulfamides; hence further studies are in progress.

Experimental

Melting points were determined in open capillary tubes on a Thermotechnal apparatus and are uncorrected. Proton and 13C nuclear magnetic resonance were determined with a AC 250 Bruker spectrometer. Fast-atom bombardment mass spectra (FAB-MS) were recorded in the positive or negative ion mode on a JEOL DX 300 mass spectrometer and the matrix was glycerol (G), a mixture of glycerol and thioglycerol (50/50 v/v) (GT) or metanitrobenzyl alcohol (NBA). Thin layer chromatography (TLC) was performed on precoated aluminium sheets of silica gel 60 F₂₅₄.

Typical procedures

1. Carbamoylation-sulfamoylation-cyclisation.

A solution of 0.05 mol of N-(chlorosulfonyl)haloalkylcarbamate was prepared by addition of haloalcohol (0.05 mol in 25 mL of dried dichloromethane) into a solution of CSI (7.1 g in the same solvent). This reagent was slowly added at 0° C into a solution containing a primary (or secondary) amine (0.05 mol in 100 mL dichloromethane) and 1.1 equiv of triethylamine. The reaction was achieved in 45 minutes. The medium was diluted with 100 mL dichloromethane, washed with two fractions of HCl 0.1 N, dried and concentrated *in vacuo*. The crude residue of N-(haloalkoxy carbonyl) sulfamides was then purified by column chromatography (yield 80-95 %).

To a solution of N-(haloalkoxycarbonyl) sulfamide (0.03 mol) in dichloromethane (25 mL) pure triethylamine (1.5 equiv) was added dropwise. The reaction was monitored by TLC. After 30 min of stirring, the medium was diluted with dichloromethane, washed with fractions of HCl 0.1 N, dried and concentrated *in vacuo*. The residue affords the crude heterocyclized compounds <u>2a-e</u> and <u>3e-g</u>, then purified by column chromatography (eluent: dichloromethane).

2. <u>Transsulfamoylation</u>; <u>transcarbamoylation</u>. To a refluxing solution of sulfamoyl oxazolidinone or perhydrooxazinone (1 equiv) and 1 equiv of triethylamine in acetonitrile was added 1.1 equiv of selected amine. The reaction was stirred for 15 to 120 min to give the 2-chloroethylsulfamides 9-14 and free oxazolidinone (or superior homologue), separated by water washing. The transcarbamoylation giving 6 and 7 was carried out at r.t. by the same mixture of reactants and solvent.

3. Nitrosation.

To a stirred solution of 0.01 mol of sulfamoyloxazolidinone (or homologue) in CH₂Cl₂ (25 mL) and 2 equiv of lithium hydroxide in 5 mL of water, 2.5 equiv of nitrosyl chloride in the same solvent was added under stirring at 0°C. The reaction medium was then separated and the organic phase was washed by HCl 0.1 N, dried and evaporated under reduced pressure.

The sulfamides 9-14 were nitrosated following a work-up previously described [19]: Dried sodium nitrite (2 equiv) was added to a stirred solution of N-(2-chloroethyl)sulfamide (0.01 mol) in 25 mL of dichloromethane and 1 mL of concentrated hydrochloric acid at 0° C during a period of 30 min. After filtering the suspension, the solution was washed, dried and evaporated under reduced pressure.

N-[(N-2-chloroethyl)sulfamoyl]-4-(bromomethyl)-2-oxazolidinone <u>2d</u> Rd: 32%

¹³C NMR (DMSOd₆): 152.24 (C=O), 68.08 (C-O), 54.94 (C-N), 51.73 (C-NH), 48.50 (C-Cl), 42.02 (C-Br).

N-[(N-2-chloroethyl)-sulfamoyl]-5-bromoperhydro-1,3-oxazin-2-one <u>3d</u> Rd: 51%

¹³C NMR (DMSOd₆): 147.33 (C=O), 71.59 (C-O), 53.73 (C-N), 44.93 (C-NH), 42.59 (C-Cl), 41.28 (C-Br).

Surprisingly, the favourized cyclization affords the 6-membered derivative, relating to the preponderant influence of the steric vs electronic factors.

N-[(N-2-chloroethyl, N-nitroso)-sulfamoyi]-2-oxazolidinone 4a

Yield: 70%. Rf: 0.89 (CH₂Cl₂/MeOH: 95/5). ¹H NMR (CDCl₃): 4.58 (t, 2H, CH₂NNO), 4.45 (t, 2H, CH₂O), 4.30 (t, 2H, CH₂Cl), 4.08 (t, 2H, CH₂N).

N-[(N-2-chloroethyl, N-nitroso)sulfamoyl]-perhydro-1,3-oxazin-2-one 5e

Yield: 65%. Rf: 0.70 (CH₂Cl₂/MeOH: 95/5). ¹H NMR, CDCl₃): 4.40 (t, 2H, CH₂NNO), 4.25 (s, 2H, CH₂O), 4.10 (t, 2H, CH₂Cl), 3.78 (t, 2H, CH₂N), 2.10 (m, 2H, C5H₂).

N-(2-O-benzylaminocarboxylethyl)-N'(2-chloroethyl)sulfamide 6

Starting from N-(N-2-chloroethylsulfamoyl)-2-oxazolidinone (1 equiv), benzylamine (1.2 equiv) in acetonitrile-triethylamine, at r.t. during 60 min.

Yield 73%. mp: 99-100°C. Rf: 0.55 (diethylether).

IR (KBr, vcm⁻¹): 3300, 3200 (NH), 1745 (C=O), 1350, 1150 (SO₂).

¹H NMR (CDCl₃): 7.35 (m, 5H, ArH), 5.20 (s, 1H, NHCO), 4.87, 4.79 (2t, 2H, 2NH), 4.40 (d, 2H, CH₂Ph), 4.30 (t, 2H, CH₂O), 3.70 (t, 2H, CH₂Cl), 3.35 (m, 4H, 2CH₂NH). MS (FAB>0; thioglycerol): 336 (M+H]⁺), 300 (M-Cl]⁺), 203 (carbamoyl cleavage), 106 (PhCH₂NH]⁺).

N-(3-O-benzylaminocarboxypropyl)-N'(2-chloroethyl)sulfamide 7____

Starting from N-[(N-2-chloroethyl)sulfamoyl)]-1,3,2-perhydrooxazinone (1 equiv), benzylamine (1.3 equiv) in acetonitrile-triethylamine, at r.T. during 60 min.. Yield 73%. mp: 98°C. Rf: 0.50 (CH₂Cl₂/MeOH: 95/5).

¹H NMR (DMSOd₆): 7.68 (t, 1H, NHCO), 7.40-7.20 (m, 6H, ArH+NH), 7.00 (t, 1H, NH), 4.19 (d, 2H, CH₂Ph), 4.00 (t, 2H, CH₂O), 3.62 (t, 2H, CH₂Cl), 3.16, 2.90 (2q, 4H, 2C**H₂NH**), 1.75 (m, 2H, CH₂ prop.).

MS (FAB<0; GT): 348 (M-H]-), 312 (M-Cl¹), 201 (carbamoyl cleavage), 106 (PhCH₂NH¹).

N-(2-hydroxyethyl)-N'-benzylurea 8_

Foam. Řf: 0.67 (diethylether). IR (neat; vcm⁻¹): 3450-3550 (OH), 3300, 3250 (NH), 1750 (C=O). ¹H NMR (CDCl₃): 7.30 (m, 5H, ArH), 4.75 (s, 1H, OH), 4.60 (t, 2H, 2NH), 4.20 (s, 2H, CH₂Ph), 3.45 (q, 2H, CH₂NH), 3.25 (t, 2H, CH₂OH).

N-(2-chloroethyl)-N'-benzylsulfamide 2 [1,3]

Yields and reaction times; starting from 2a: 95% (15 min); 2b: 90% (30 min); 2c: 65% (120 min); 2-3d mixt: 50% (120 min); 3e: 92% (45 min); 3f: 86% (60 min).

N-(2-chloroethyl)-N'-pentylsulfamide 10

Starting from **2a**: 97% (25 min); **2b**: 92% (45 min); **3f**: 86% (60 min). mp: 97 °C. Rf: 0.82 (CH₂Cl₂/MeOH: 95/5) IR (KBr, vcm⁻¹): 3300 (NH), 1365, 1135 (SO₂). ¹H NMR (CDCl₃): 4.45 (t, 1H, N³H), 4.25 (t, 1H, N¹H), 4.00 (t, 2H, CH₂Cl), 3.48 (q, 2H, CH₂NH), 3.00 (q, 2H, N³CH₂), 1.62 (m, 2H, N³CH₂CH₂), 1.20 (m, 4H, CH₂ pent.), 0.85 (t, 3H, CH₃).

N-[(N-2-chloroethyl)sulfamoyl]pyrrolidine 11

starting from 2a: 85% (20 min); 2-3d mixt: 55% (100 min). Foam. Rf: 0.82 (CH₂Cl₂/MeOH: 95/5) IR (neat, vcm⁻¹): 3300 (NH), 1365, 1150 (SO₂). ¹H NMR (CDCl₃): 4.45 (t, 1H, NH), 3.59 (t, 2H, CH₂Cl), 3.33 (q, 2H, CH₂NH), 3.23 (m, 4H, NCH₂ pyrr.), 1.85 (m, 4H, CH₂CH₂).
