The marine alkaloid rigidin has been synthesized from 2,4-dimethoxy-7-phenylsulfonylpyrrolo[2,3-d]-pyrimidine. Lithiation of the pyrrolo[2,3-d]-pyrimidine followed by electrophilic substitution with N,4-dimethoxy-N-methylbenzamide afforded a 6-(4-methoxy)benzoyl derivative which by alkaline hydrolysis and subsequent iodination was converted into 2,4-dimethoxy-5-iodopyrrolo[2,3-d]-pyrimidin-6-yl 4-methoxyphenyl ketone. The palladium-catalysed arylation of this with 2-(4-methoxyphenyl)-1,3,2-dioxaborinane followed by demethylation with boron tribromide gave rigidin.

The pyrrolo[2,3-d]pyrimidine skeleton is found in a number of biologically active compounds including both antibiotics ³⁻⁵ and nucleosides. ^{6,7} In addition, it is contained in rigidin, a compound isolated from the Okinawan marine tunicate *Eudistoma* cf. *rigida* by Kobayashi, *et al.* in 1990 and found to inhibit calmodulin-activated brain phosphodiesterase. ⁸

As an extension to our earlier report of the formation of the pyrrolopyrimidine skeleton from halogenopyrimidine derivatives by a key palladium-catalysed reaction, 9 and because of our interest in the biological activity of such compounds we report a total synthesis of rigidin.

Strategy for the synthesis of rigidin

The first total synthesis of rigidin started from 6-chlorouracil and began with pyrrole ring formation. ¹⁰ In our work, we chose 2,4-dimethoxypyrrolo[2,3-d]pyrimidine 1a as starting material; this was prepared by either the palladium-catalysed reaction of 6-acetylamino-5-bromo-2,4-dimethoxypyrimidine with (Z)-1-ethoxy-2-(tributylstannyl)ethene as a key step ^{9c} or a classical pyrimidine cyclisation method. ¹¹ Our strategy consists of the acylation by way of lithiation at the 6-position of 1a, halogenation of the 5-position and palladium-catalysed arylation at the 5-position as shown in Scheme 1.

Scheme 1

Electrophilic substitution of pyrrolo[2,3-d]pyrimidines by way of lithiation

In order to effect lithiation at the 7-position of **1a** a suitable directed metallation group (DMG) was needed. Initially, Levy's method, ¹² in which a *tert*-butoxycarbonyl group as a DMG

was used for the lithiation of indoles at the 2-position, was applied to 7-tert-butoxycarbonyl-2,4-dimethoxypyrrolo[2,3-d]pyrimidine 1b. In the event, reaction of 1b with tert-butyllithium at -78 °C followed by quenching with deuterium oxide gave none of the expected 6-deuterio derivative, 1b being recovered (85%). This result was interpreted as being due to lithiation difficulties associated with steric hindrance by the tert-butyl group, in which the tert-butyllithium was coordinated between N-1 of the pyrrolo[2,3-d]pyrimidine ring and the carbonyl group of Bu'CO₂.

Katritzky's method 13 was then tried in which a lithiooxycarbonyl group was used as a DMG. According to this procedure, 1a was first treated with butyllithium and then allowed to react with CO_2 to give the 7-lithiooxycarbonyl derivative. Lithiation of this with tert-butyllithium at -78 °C, followed by deuteriation gave a mixture of 2,4-dimethoxy[6- 2H_1]-pyrrolo[2,3-d]pyrimidine and 1a (ratio 15:85 by 1H NMR), in which the proportion of the former was insufficient for our purpose.

Finally, we tried Gribble's method ¹⁴ in which the phenylsulfonyl group was used as a DMG for the lithiation of indoles. 2,4-Dimethoxy-7-phenylsulfonylpyrrolo[2,3-d]pyrimidine 1c when treated with *tert*-butyllithium at -78 °C followed by deuterium oxide gave the 6-deuterio derivative 2a in 83% yield. This reacted smoothly with electrophiles other than deuterium oxide to give the products listed in Table 1 in the yields shown.

On the basis of the results described, we concluded that phenylsulfonyl group is a favourable DMG for the lithiation at the 6-position of pyrrolo[2,3-d]pyrimidine ring.

Halogenation of pyrrolo[2,3-d]pyrimidines

In order to introduce a 5-aryl group into the pyrrolo[2,3-d]-pyrrole skeleton halogenation of this system was initially necessary. Bromination of pyrrolo[2,3-d]pyrimidine **3a** and 2,4-dimethylpyrrolo[2,3-d]pyrimidine **4a** with bromine in N,N-dimethylformamide (DMF) at room temperature gave the corresponding 5-bromo derivatives **5a,b** in 40 and 74% yields, respectively. However, a similar bromination of **1a** gave a mixture of 5-bromo derivative **5c** and the 5,6-dibromo derivative even at $-30\,^{\circ}$ C.

In contrast, iodination of the same substrates with iodine in the presence of potassium hydroxide in DMF gave only the 5-iodo derivatives **5d,e,f** with none of the 5,6-diiodo derivatives. In the light of these results and because iodides are more reactive than bromides in palladium-catalysed reactions, we chose the former for the introduction of an aryl group into the pyrrolo[2,3-d]pyrimidine skeleton.

Palladium-catalysed arylation of 5-iodopyrrolo[2,3-d]pyrimidines

Of the methods available for the palladium-catalysed arylation of aromatic halides with metalloarenes, 15 we chose arylboronic esters as the metalloarenes for the arylation of the pyrrolo-[2,3-d]pyrimidine ring at the 5-position. Thus, 5-iodo-2,4dimethoxy-7-phenylsulfonylpyrrolo[2,3-d]pyrimidine **6b** reacted with 2-(4-methoxyphenyl)-1,3,2-dioxaborinane in the presence of tetrakis(triphenylphosphine)palladium and potassium phosphate in tetrahydrofuran (THF) under reflux to give 2,4-dimethoxy-5-(4-methoxyphenyl)-7-phenylsulfonylpyrrolo-[2,3-d] pyrimidine 7c (33%) together with recovered 6b (42%). A similar reaction in DMF at 100 °C gave 7c (41%) and the de-phenylsulfonylated compound 8c (14%), while the reaction in THF gave no 8c (Table 3).

Synthesis of rigidin

The total synthesis of rigidin was performed by the route shown in Scheme 2. Thus, 2,4-dimethoxy-7-phenylsul-

fonylpyrrolo[2,3-d]pyrimidine 1c was lithiated with tertbutyllithium at -78 °C and then treated with 4-methoxybenzaldehyde to give 6-[hydroxy(4-methoxyphenyl)methyl]-2,4dimethoxy-7-phenylsulfonylpyrrolo[2,3-d]pyrimidine 9. This was oxidized with 2,3-dichloro-5,6-dicyano-1,4-benzoquinone (DDQ) to afford the 4-methoxybenzoyl derivative 10 (87%). Compound 10 was also obtained from the reaction of the lithiated 1c with N,4-dimethoxy-N-methylbenzamide (55%). Alkaline hydrolysis of 10 and subsequent iodination gave the

General comments

Tetrahydrofuran (THF) was distilled from sodium-benzophenone ketyl before use. BuLi and Bu'Li were titrated using 2,5-dimethoxybenzyl alcohol ¹⁶ before use. [Pd(PPh₃)₄] was prepared from [Pd(PPh₃)₂Cl₂], PPh₃ and BuLi (1:2:2). ¹⁷ Mps and bps are uncorrected. IR spectra were taken on a JASCO IR-A1 810 spectrophotometer. ¹H NMR spectra were recorded on a Hitachi R-3000 (300 MHz) spectrometer. ¹³C NMR spectra were recorded on a JEOL JNM GX-500. Chemical shifts are expressed as δ values, and coupling constants are expressed in Hz. The following abbreviations are used: s = singlet, d = doublet, t = triplet, q = quartet, quin = quintet, m = multiplet, dd = double doublet and br = broad. Mass spectra (MS) and high resolution mass spectra (HRMS) were recorded on a JMS-DX303 and JMS-AX500 instruments.

Phenylsulfonylation of pyrrolo [2,3-d] pyrimidines: general procedure A

A suspension of NaH in THF [obtained from NaH (60% dispersion in mineral oil) by washing with THF] was added to a solution of a pyrrolo[2,3-d]pyrimidine in THF, and the mixture was stirred at room temperature for 1 h. PhSO₂Cl was added to the mixture which was then stirred at room temperature for 1 h. After this it was evaporated under reduced pressure and diluted with ice—water. After neutralization with saturated aq. NH₄Cl (20 cm³) the mixture was extracted with CHCl₃ (2 × 50 cm³). The combined extracts were washed with saturated brine (10 cm³), dried (MgSO₄) and concentrated under reduced pressure to give the residue.

2,4-Dimethoxy-7-phenylsulfonylpyrrolo[2,3-d]pyrimidine 1c

According to general procedure A, the crude product obtained from the reaction of **1a** (1.19 g, 6.65 mmol) in THF (150 cm³), NaH (60% dispersion in mineral oil; 0.53 g, 13 mmol) in THF (10 cm³) and PhSO₂Cl (0.94 cm³, 7.3 mmol), was purified by silica gel column chromatography using hexane–AcOEt (3:1) as eluent. Deuteriation of 2,4-dimethoxy-7-(lithiooxycarbonyl)pyrrolo-[2,3-d]pyrimidine

1.14 mol dm⁻³ BuLi in hexane (1.92 cm³, 2.2 mmol) was added to a solution of 1a (358 mg, 2 mmol) in THF (15 cm³) at -78 °C under argon atmosphere, and the mixture was stirred at the same temperature for 1 h. The mixture was saturated with dry CO₂ at the same temperature after which it was stirred for 2 h and allowed to reach 5 °C. After evaporation of the mixture at 5 °C, THF (15 cm³) was added to the residue followed by 1.20 mol dm⁻³ Bu^tLi in pentane (1.75 cm³, 2.1 mmol), added at -78 °C. The mixture was stirred at the same temperature for 2 h after which it was treated with D₂O (0.2 cm³) and allowed to reach room temperature. The reaction was quenched by the addition of saturated aq. NH₄Cl (10 cm³) to the mixture which was then extracted with AcOEt (3 \times 50 cm³). The combined extracts were washed with saturated aq. NaCl (10 cm³), dried (MgSO₄) and evaporated. The residue (305 mg) was analysed by ¹H NMR spectroscopy.

Electrophilic substitution by way of lithiation of 2,4-dimethoxy-7-phenylsulfonylpyrrolo[2,3-d]pyrimidine: general procedure B A pentane solution of Bu^tLi was added to a THF solution of 1c at -78 °C under argon atmosphere. Palladium-catalysed cross-coupling of 5-iodo-7-phenylsulfonyl-pyrrolo[2,3-d]pyrimidines with 2-aryl-1,3,2-dioxaborinane: general procedure E

A mixture of a 5-iodo-7-phenylsulfonylpyrrolo[2,3-d]pyrimidine, a 2-aryl-1,3,2-dioxaborinane, K₃PO₄ and [Pd(PPh₃)₄] in anhydrous DMF was heated at 100 °C for 4–6 h under argon atmosphere after which it was diluted with water (50 cm³) and extracted with Et₂O (3 × 50 cm³). The ethereal extract was washed with saturated brine (10 cm³), dried (MgSO₄) and concentrated under reduced pressure.

Palladium-catalysed cross-coupling of 5-iodo-2,4-dimethyl-7phenylsulfonylpyrrolo[2,3-d]pyrimidine 6a with 2-phenyl-1,3,2dioxaborinane. According to general procedure E, the crude product obtained from the reaction of 6a (413 mg, 1 mmol), 2-phenyl-1,3,2-dioxaborinane ²⁰ (177 mg, 1.1 mmol), K₃PO₄ (318 mg, 1.5 mmol) and [Pd(PPh₃)₄] (46 mg, 0.05 mmol) in anhydrous DMF (5 cm³) was purified by silica gel column chromatography using hexane-AcOEt (4:1) as eluent. The first eluted product was 2,4-dimethyl-5-phenyl-7-phenylsulfonylpyrrolo[2,3-d]pyrimidine 7a which crystallized from AcOEthexane as colourless prisms (196 mg, 54%), mp 166–168 °C; $\delta_{\rm H}({\rm CDCl_3} + {\rm TMS})$ 2.39 (3 H, s), 2.78 (3 H, s), 7.37–7.66 (9 H, m) and 8.27–8.31 (2 H, m); $v_{\text{max}}(\text{CHCl}_3)/\text{cm}^{-1}$ 1580, 1550, 1370 and 1170; m/z 363 (M⁺) (Found: C, 66.1; H, 4.8; N, 11.45; S, 8.85. Purification of the residue by silica gel column chromatography using hexane-AcOEt (2:1) as eluent gave the crude product which crystallized from AcOEt as yellow prisms (201 mg, 60%), mp 165–166 °C; $\delta_{H}(CDCl_3 + TMS)$ 3.74 (6 H, s), 3.99 (3 H, s), 4.06 (3 H, s), 6.56 (2 H, d, J 8.8), 6.64 (2 H, d, J 8.8), 7.11 (2 H, d, J 8.4), 7.43 (2 H, d, J 8.4) and 9.37 (1 H, br s); $v_{\text{max}}(\text{CHCl}_3)/\text{cm}^{-1}$ 3400, 1600 and 1570; m/z 419 (M⁺) (Found: C, 65.8; H, 5.1; N, 10.0. Calc. for C₂₃H₂₁IN₃O₅: C, 65.86; H, 5.05; N, 10.02%).

Rigidin[2,4-dioxo-5-(4-hydroxyphenyl)-1,2,3,4-tetrahydro-[2,3-d]pyrimdin-6-yl 4-hydroxyphenyl ketone]

BBr₃ (0.19 cm³, 2 mmol) was added to a suspension of 12 (84 mg, 0.2 mmol) in anhydrous 1,2-dichloroethane (10 cm³), at −30 °C. The mixture was allowed to reach room temperature and then heated under reflux for 24 h. After cooling, the mixture was diluted with water (10 cm³), neutralized with K_2CO_3 and extracted with AcOEt (3 × 50 cm³). The combined extracts were washed with saturated brine (10 cm³), dried

(MgSO₄) and concentrated under reduced pressure. Purification of the residue by silica gel column chromatography using AcOEt as eluent gave a yellow powder (30 mg, 41%), mp > 300 °C (lit.,^{8,10} mp > 300 °C); $\delta_{H}([^{2}H_{6}]$ -DMSO + TMS) 6.45 (2 H, d, J 8.1), 6.47 (2 H, d, J 7.3), 6.95 (2 H, d, J 8.1), 7.29 (2 H, d, J 7.3), 9.23–9.26 (1 H, br), 9.95–9.99 (1 H, br), 10.63 (1 H, br s), 11.17–11.21 (1 H, br) and 11.74–11.78 (1 H, br); δ_c (75 MHz [²H₆]-DMSO) 183.4, 158.8, 158.0, 154.6, 149.0, 130.4, 129.7, 128.9, 126.8, 126.3, 123.0, 121.0, 112.4, 111.9 and 96.4; $v_{\text{max}}(KBr)/cm^{-1}$ 3200, 1700 and 1610.
