Received August 1, 2005

(Arylethyl)iridium(III) porphyrins were oxidized selectively with excess 2,2,6,6-tetramethylpiperidinoxy (TEMPO) at the benzylic positions to yield (2-aryl-2-oxoethyl)iridium porphyrins. Other alkyl- and PhCH₂CH₂CH₂-substituted iridium porphyrins did not react or gave complex mixtures and low yields of iridium methyl. The proposed intermediate of the carbon-centered Ir^{III}(CH₂CHR•) radical is probably stabilized by the β iridium center, allowing the (slipped) olefin metalloradical complex Ir^{II}(CH₂=CHR) as a reasonable resonance structure.

Introduction

2,2,6,6-Tetramethylpiperidinoxy (TEMPO) and related nitroxides exhibit a rich chemistry with organometallic alkyls. In the determination of bond dissociation energies of transition-metal–alkyl bonds by kinetic methods, nitroxides are efficient alkyl radical traps which are extensively applied in the chemistry of vitamin B₁₂ and related models,^{1,2} cyclopentadienyl-metal alkyl complexes,³ and alkylruthenium porphyrin complexes.^{4,5} They also react directly as reagents with metal alkyls bearing β -hydrogens via hydrogen atom abstraction to produce reactive metal-centered radicals which subsequently activate the alkyl–methine carbon–carbon bonds of nitroxides to give new alkylrhodium porphyrins.^{6,7} Some reactions of metal alkyls proceed via initial β -hydrogen elimination to give metal hydrides, which subsequently react with TEMPO.⁸ Reactions of TEMPO with rhodium and iridium porphyrin hydrides to give their corresponding metal dimers are known.⁹ TEMPO reacts with the methyl group of Ru(oep)Me (oep²⁻ = octaethylporphyrinate dianion) to give (oep)Ru(CO). Through ¹³C labeling it could be proven that the carbonyl carbon atom indeed stems from the methyl group (lacking β -hydrogens) of the starting

Figure 1. Structure of Ir(tpp)R.

material.¹⁰ We have extended the studies of the reactions of rhodium porphyrin alkyls with nitroxides⁶ to that of iridium porphyrin alkyls and herein report the unique selective oxidation of ArCH₂CH₂Ir(tpp) at the benzylic position by TEMPO to give Ar(CO)CH₂Ir(tpp). In addition, this paper gives further proof for the recently described stabilization of carbon-centered Ir^{III}(CH₂CHR•) radicals by the iridium center, which allows delocalization of the radical by giving access to the (slipped) olefin metalloradical complex Ir^{II}(CH₂=CHR) as a reasonable resonance structure.¹¹

Results and Discussion

Iridium porphyrin alkyls were synthesized in moderate to good yields according to the literature method by the reductive alkylation of Ir(tpp)(CO)Cl (tp = 5,10,15,20-tetra-4-tolylporphyrinate; Figure 1) with NaBH₄ and RI/RBr (Figure 1).^{12,13} We investigated the reactivity of Ir(tpp)R toward TEMPO at elevated temperatures. The reactivity toward TEMPO strongly depends on the nature of the alkyl group R. We observed three possible outcomes of the reaction (Scheme 1): i.e., β -carbon

Scheme 1

oxidation (type 1), formation of Ir(tpp)Me (type 2), and simple recovery of the starting material (type 3).

Type 1. Arylethyliridium porphyrins **1a–d** (eq 1; Table 1, entries 1–4) reacted cleanly with 15 equiv of TEMPO at 80 °C in 12 days to give good yields of Ir-(tpp)CH₂COAr (**8a–d**). The starting materials disap-

peared rapidly within 6 days, and the rates increased with increasing electron-rich substituents of iridium alkyls (Table 1, entries 1–4: MeO > Me > H > Cl). In less than 12 days, lower yields of products were obtained together with the formation of unidentifiable, presumably decomposed labile intermediates. Attempted chromatographic isolation of these intermediates remained unsuccessful. A lower yield of 38% for **8b** was obtained when the reaction was carried out with 10 equiv of TEMPO in 11 days. The structures of Ir(tpp)CH₂COAr were ascertained on the basis of spectroscopic data. In the ¹H NMR spectrum, addition of Ph₃P (1 equiv) shifted the methylene singlet of **8b** at δ -3.88 ppm upfield to -4.91 ppm and further split the singlet into a doublet with ³J_{P-H} = 13.5 Hz. The possibility that **8b** could be the other possible regioisomer, i.e., Ir(tpp)COCH₂Ph from α-carbon oxidation instead of β-carbon oxidation, could be excluded on the basis of the magnitude of the coupling constant, because the methylene signals in (Ph₃P)Ir(tpp)CH₂CH₂Ph were measured with ³J_{P-H} = 10.0 Hz without any ⁴J_{P-H} observed. Furthermore, the IR stretching frequencies of carbonyls fall at 1621–1633 cm⁻¹ and differ from those of metal acyl complexes. Therefore, the positions of the carbonyls were ascertained to be β to iridium. The reactions were performed strictly under a N₂ atmosphere, and we can exclude that the oxygen atoms of the β-carbonyl fragments stem from dioxygen from air. The oxygen atoms must thus stem from TEMPO.

Scheme 2 illustrates a proposed mechanism for the formation of Ir(tpp)CH₂COAr. TEMPO initially abstracts the fairly weak benzylic hydrogen¹⁴ (BDE of PhCH₂-H 88 kcal/mol)¹⁵ from Ir(tpp)CH₂CH₂Ar to generate the IrCH₂CHAr carbon-centered radical **A** and the reduction product R₂NOH, i.e., TEMPO-H (BDE of TEMPO-H 70 kcal/mol) (eq 2).¹⁵ Due to the Ir-C bond being stronger compared to the Rh-C bond (an observation generally encountered when comparing metal-ligand bond strengths of second- and third-row transition-metal complexes¹⁶), **A** does not undergo Ir-C bond

cleavage as was observed for Rh(tpp)CH₂CHPh.⁶ Instead, **A** cross-couples rapidly with TEMPO,¹⁷ especially in excess, to give the oxygenated intermediate **B**. Intermediate **B** then decomposes with formation of the Ir(tpp)CH₂C(O)Ar products, either directly via a shift of the remaining β-hydrogen to the attached “TEMPO” nitrogen (with elimination of R₂NH) or via abstraction of the remaining benzylic hydrogen in **B** by an additional TEMPO molecule. The ketone product could then be obtained via elimination of a reactive free aminyl radical which participates in hydrogen abstraction of another intermediate **B**. The latter possibility would account for the observed increased rates and yields in the presence of excess TEMPO. The mechanism proposed here for the β oxidation of Ir^{III}CH₂CH₂-Ar compounds with TEMPO resembles the recently proposed mechanism of Ir^{II}(ethene) species with O₂ via β oxidation of intermediate Ir^{III}-CH₂CH₂• carbon radicals.¹⁹

Scheme 2. Proposed Mechanism for Formation of Ir(tpp)CH₂COR

Type 2. Alkyliridium porphyrins bearing β-hydrogens (Table 1, entries 5–8) reacted with TEMPO at a higher temperature of 160 °C to give Ir(tpp)Me, with no reaction observed at 80 °C. Propyl complex **4** reacted completely and gave Ir(tpp)Me in 43% yield (Table 1, entry 7). Complexes **2**, **3**, and **5** gave trace amounts of Ir(tpp)Me (**6**), and starting materials were recovered. No iridium porphyrin product from oxidation of the alkyl group was isolated. Even the iridium benzylic γ-hydrogens in PhCH₂CH₂CH₂Ir(tpp) (**5**) did not undergo any oxidation.

A plausible mechanism for the formation of Ir(tpp)Me is similar to that proposed for formation of Rh(tpp)Me from Rh(tpp)CH₂CH₂R.⁶ Initially, Ir(tpp)CH₂CH₂R reacts with TEMPO to produce an intermediate analogous to **A** (Scheme 1). In the absence of stabilization from the adjacent aromatic ring, the Ir(tpp)CH₂CHR radical decomposes rapidly with Ir-C cleavage to yield an olefin and the Ir^{II}(tpp) metalloradical at higher reaction temperatures. The Ir^{II}(tpp) metalloradical then attacks TEMPO, resulting in methyl group transfer from TEMPO to iridium and formation of Ir(tpp)Me.^{6,7}

**Figure 2.** Stabilization of Ir(tpp)CH₂CHR•.

Type 3. Ir complexes **6**, **6-d₃**, and **7** (Table 1, entries 9–11), lacking β -hydrogens, did not react with TEMPO to give any isolable product. Only decomposition occurred with partial recovery of starting materials. The possibility of generation of Ir^{II}(tpp) from Ir(tpp)Me by α -hydrogen abstraction and further decomposition or homolysis followed by subsequent carbon–carbon bond activation with TEMPO was ruled out by reaction of the deuterium labeled complex **6-d₃**. No Ir(tpp)Me was detected; only Ir(tpp)CD₃ was recovered. Ir(tpp)Bn (**7**) also did not yield any Ir(tpp)COPh.

The three possible outcomes in the reactions with TEMPO suggest that the carbon-centered radical in Ir^{III}(tpp)CH₂CHAr is strongly stabilized by both the aryl group and the Ir^{III} metal center. The aryl group is well-known for stabilization of benzylic radicals through conjugation, but also the β -Ir^{III} site allows the radical to be positioned over multiple positions via the resonance structures **I** (Ir^{III}–CH₂CHR•) and **II** (Ir^{II}(CH₂=CHR)) in Figure 2. The type 3 outcome of the reactions with TEMPO reveals that neither PhCH₂CH₂CH₂Ir(tpp) (**5**) with benzylic γ -hydrogens nor Ir(tpp)Me (**6**) with only α -hydrogens is oxidized by TEMPO to give an oxygenated iridium alkyl. Apparently alkyl radicals from hydrogen abstraction at the α and γ positions to the iridium center are not easily formed, which are in contrast with the apparent easy formation of radicals by β -hydrogen abstraction from Ir–CH₂CH₂R. The type 2 outcome of the reactions reveals that radicals formed by β -hydrogen abstraction from Ir^{III}CH₂CH₂R (R = alkyl), yielding radicals only stabilized by the β iridium center without additional benzylic stabilization, all decompose with formation of Ir(tpp)Me. Apparently, the Ir^{III}CH₂CHR• (R = alkyl) radical undergoes Ir–alkyl bond scission more easily than the Ir^{III}CH₂CH₂Ar• radical. We interpret this different behavior by assuming that the resonance structure **I** (Ir^{III}–CH₂CHR•) in Figure 2 dominates for R = aryl, whereas resonance structure **II** (Ir^{II}(CH₂=CHR)) dominates for R = alkyl. The latter gives rise to more rapid olefin dissociation, leading to formation of the metalloradical Ir^{II}(tpp), which subsequently abstracts a methyl group from TEMPO. In type 1, the combined stabilization of both the Ir center and aryl group allow the Ir(tpp)CH₂CHAr radical to be sufficiently long-lived to be trapped by TEMPO

for further oxidation. Indeed, such Rh^{II}(por)CH₂CH₂ (or Rh^{III}(por)CH₂CH₂•; por = porphyrinato)¹⁸ and Ir^{II}CH₂CH₂¹¹ (or Ir^{III}CH₂CH₂•) species have been stabilized by metal centers.

Conclusion

We have reported a novel and high-yield synthesis of Ir(tpp)CH₂COAr from the oxidation of Ir(tpp)CH₂CH₂Ar with TEMPO. Non- β -aryl-substituted ethyliridium porphyrins gave Ir^{II}(tpp), which subsequently yielded Ir(tpp)Me after aliphatic carbon–carbon bond activation with excess TEMPO. Phenyl α or γ carbon–hydrogen bonds of iridium porphyrin alkyls did not react with TEMPO at all. These experiments give further support that carbon-centered Ir^{III}(CH₂–CHR•) radicals are stabilized by the β iridium center.

Experimental Section

All materials were obtained from commercial suppliers and used without further purification, unless otherwise specified. Benzene was distilled from sodium. Dichloromethane and hexanes for the reaction were distilled from calcium hydride. Hexanes for chromatography were distilled from anhydrous calcium chloride.²⁰ (4-Chlorophenyl)ethyl bromide, (4-methylphenyl)ethyl bromide, and (4-methoxyphenyl)ethyl bromide were prepared according to the literature method.²¹

Thin-layer chromatography was performed on Merck pre-coated silica gel 60 F₂₅₄ plates. Silica gel (Merck, 70–230 and 230–400 mesh) was used for column chromatography.

¹H NMR spectra were recorded on a Bruker DPX 300 (300 MHz) spectrometer. Spectra were referenced internally to the residual proton resonance in CDCl₃ (δ 7.26 ppm), tetramethylsilane (TMS, δ 0.00 ppm), tetrakis(trimethylsilyl)silane ((TMS)₄Si, δ 0.00 ppm), or C₆D₆ (δ 7.15 ppm) as the internal standard. Chemical shifts (δ) were reported in parts per million (ppm) in δ scale downfield from TMS or (TMS)₄Si. ¹³C NMR spectra were recorded on a Bruker DPX 300 (75 MHz) spectrometer and referenced to CDCl₃ (δ 77.00 ppm). Coupling constants (*J*) were reported in hertz (Hz). High-resolution mass spectra (HRMS) were performed on a Thermofinnigan MAT 95 XL instrument (FABMS).

Preparation of Chloro(5,10,15,20-tetratolylporphyrinato)carbonyliridium(III) (Ir(tpp)Cl(CO)). H₂tpp (350 mg, 0.52 mmol) and [Ir(COD)Cl]₂ (524 mg, 0.78 mmol) were added into xylene (200 mL), and the solution was refluxed for 3 days. The solution changed color from purple to red. The crude mixture was dried under high vacuum and purified by silica gel column chromatography, with a solvent mixture of hexane

and CH₂Cl₂ (4:1) as eluent. The fast-moving purple fraction was discarded, and the following red fraction was collected. A reddish purple solid (317 mg, 0.34 mmol, 66%) was obtained by recrystallization from CH₂Cl₂/CH₃OH. ¹H NMR (CDCl₃, 300 MHz): δ 2.71 (s, 8 H), 7.56 (d, 8 H, *J* = 8.4 Hz), 8.08–8.16 (m, 8 H), 8.94 (s, 8 H). Anal. Calcd for C₄₉H₃₆N₄OClIr: C, 63.66; H, 3.92; N, 6.06. Found C, 63.48; H, 3.95; N, 5.90.

Preparation of (Porphyrinato)iridium(III) Alkyls (Ir-(por)R). The reductive alkylation of Ir(tp)Cl(CO) is described as a typical example for the preparation of (porphyrinato)iridium(III) alkyl complexes, adapting the literature procedure reported by Ogoshi.¹³

(5,10,15,20-Tetratolylporphyrinato)methyliridium-(III) (6). A suspension of Ir(tp)Cl(CO) (120 mg, 0.13 mmol) in THF (50 mL) and a solution of NaBH₄ (49 mg 1.30 mmol) in aqueous NaOH (1 M, 3 mL) were purged with N₂ for 15 min separately. The solution of NaBH₄ was added slowly to the suspension of Ir(tp)Cl(CO) via a cannula. The mixture was heated at 70 °C under N₂ for 2 h in a Teflon screw-capped tube to give a brown suspension. The mixture was then cooled to room temperature under N₂, and iodomethane (37 mg, 0.26 mmol) was added. The reaction mixture was further heated at 70 °C under N₂ for 2 h. A reddish brown suspension was formed. The reaction mixture was worked up by extraction with CH₂Cl₂/H₂O. The combined organic extract was dried (MgSO₄), filtered, and rotary evaporated. The reddish orange residue was purified by column chromatography over silica gel (250–400 mesh), with a solvent mixture of hexane and CH₂-Cl₂ (4:1) as eluent. The major red fraction was collected and gave a reddish purple solid (63 mg, 0.07 mmol, 55%) as the product after rotary evaporation. The product was further purified by recrystallization from CH₂Cl₂/CH₃OH. ¹H NMR (CDCl₃, 300 MHz): δ -6.33 (s, 3 H), 2.68 (s, 12 H), 7.50 (d, 8 H, *J* = 6.0 Hz), 7.19–8.04 (m, 8 H), 8.51 (s, 8 H). HRMS (FABMS): calcd for [C₄₉H₃₉N₄Ir]⁺, *m/z* 876.2798; found, *m/z* 876.2795. Anal. Calcd for C₄₉H₃₉N₄Ir: C, 67.18; H, 4.49; N, 6.39. Found C, 67.45; H, 4.21; N, 6.00.

(5,10,15,20-Tetratolylporphyrinato)[(4-methoxyphenyl)-ethyl]iridium(III) (1a). Reddish purple solids (65%). ¹H NMR (CDCl₃, 300 MHz): δ -5.39 (t, 2 H, *J* = 9.0 Hz), -3.35 (t, 2 H, *J* = 9.0 Hz), 2.68 (s, 12 H), 3.33 (s, 3 H), 4.86 (d, 2 H, *J* = 8.7 Hz), 5.89 (d, 2 H, *J* = 8.7 Hz), 7.49 (m, 8 H), 7.95 (d, 4 H, *J* = 7.5 Hz), 8.02 (d, 4 H, *J* = 7.5 Hz), 8.51 (s, 8 H). (5,10,15,20-Tetratolylporphyrinato)[(4-chlorophenyl)-ethyl]iridium(III) (1d). Reddish purple solids (72%). ¹H NMR (CDCl₃, 300 MHz): δ -5.38 (t, 2 H, *J* = 9.0 Hz), -3.34 (t, 2 H, *J* = 9.0 Hz), 2.68 (s, 12 H), 4.81 (d, 2 H, *J* = 8.4 Hz), 6.30 (d, 2 H, *J* = 8.4 Hz), 7.50 (m, 8 H), 7.93 (d, 4 H, *J* = 7.2 Hz), 8.03 (d, 4 H, *J* = 7.2 Hz), 8.51 (s, 8 H). HRMS (FABMS): calcd for [C₅₆H₄₄N₄IrCl]⁺, *m/z* 1000.2878; found, *m/z* 1000.2891. Anal. Calcd for C₅₆H₄₄N₄IrCl·CH₃OH: C, 66.29; H, 4.68; N, 5.43. Found C, 66.66; H, 4.45; N, 5.37.

(5,10,15,20-Tetratolylporphyrinato)(2-cyanoethyl)iridium(III) (2). Reddish purple solids (45%). ¹H NMR (CDCl₃, 300 MHz): δ -6.09 to -5.94 (m, 2 H), -4.33 to -4.21 (m, 2 H), 2.68 (s, 12 H), 7.50–7.48 (m, 8 H), 7.87–7.85 (m, 8 H), 8.45 (s, 8 H). HRMS (FABMS): calcd for [C₅₁H₄₀N₅Ir]⁺, *m/z* 915.2907; found, *m/z* 915.2925. Anal. Calcd for C₅₁H₄₀N₅Ir: C, 66.94; H, 4.41; N, 7.65. Found: C, 66.82; H, 4.41; N, 7.55.

(5,10,15,20-Tetratolylporphyrinato)ethyliridium(III) (3). Reddish purple solids (65%). ¹H NMR (CDCl₃, 300 MHz): δ -5.55 (q, 2 H, *J* = 9.0 Hz), -4.63 (t, 3 H, *J* = 9.0 Hz), 2.68 (s, 12 H), 7.49 (t, 8 H, *J* = 5.4 Hz), 7.95 (m, 8 H), 8.50 (s, 8 H). HRMS (FABMS): calcd for [C₅₀H₄₁N₄Ir]⁺, *m/z* 890.2957; found, *m/z* 890.2966. Anal. Calcd for C₅₀H₄₁N₄Ir·CH₃OH: C, 66.42; H, 4.91; N, 6.08. Found: C, 66.75; H, 4.98; N, 5.93.

(5,10,15,20-Tetratolylporphyrinato)propyliridium-(III) (4). Reddish purple solids (56%). ¹H NMR (CDCl₃, 300 MHz): δ -5.60 (t, 2 H, *J* = 9.0 Hz), -4.40 (sextet, 2 H, *J* = 9.0 Hz), -1.71 (t, 3 H, *J* = 9.0 Hz), 2.68 (s, 12 H), 7.50 (d, 8 H, *J* = 7.5 Hz), 7.97 (m, 8 H), 8.49 (s, 8 H). HRMS (FABMS): calcd for [C₅₁H₄₃N₄Ir]⁺, *m/z* 904.3118; found, *m/z* 904.3136. Anal. Calcd for C₅₁H₄₃N₄Ir: C, 67.75; H, 4.79; N, 6.19. Found: C, 67.71; H, 4.84; N, 6.07.

(5,10,15,20-Tetratolylporphyrinato)(3-phenylpropyl)-iridium(III) (5). Reddish purple solids (78%). ¹H NMR (CDCl₃, 300 MHz): δ -5.15 (t, 2 H, *J* = 9.0 Hz), -4.14 (p, 2 H, *J* = 9.0 Hz), -0.35 (t, 2 H, *J* = 9.0 Hz), 2.68 (s, 12 H), 5.55 (d, 2 H, *J* = 6.6 Hz), 6.71–6.78 (m, 3 H), 7.48 (t, 8 H, *J* = 7.8 Hz), 7.89 (d, 4 H, *J* = 7.8 Hz), 8.02 (d, 4 H, *J* = 7.8 Hz), 8.50 (s, 8 H). HRMS (FABMS): calcd for [C₅₇H₄₇N₄Ir]⁺, *m/z* 980.3429; found, *m/z* 980.3426. Anal. Calcd for C₅₇H₄₇N₄Ir: C, 69.84; H, 4.83; N, 5.71. Found: C, 69.63; H, 4.89; N, 5.57.

(5,10,15,20-Tetratolylporphyrinato)(methyl-*d*₃)iridium-(III) (6-*d*₃). Reddish purple solids (43%). ¹H NMR (CDCl₃, 300 MHz): δ 2.68 (s, 12 H), 7.50 (d, 8 H, *J* = 6.0 Hz), 7.19–8.04 (m, 8 H), 8.51 (s, 8 H). HRMS (FABMS): calcd for [C₄₉H₃₆N₄D₃-Ir]⁺, *m/z* 879.2987; found, *m/z* 879.2971.

(5,10,15,20-Tetratolylporphyrinato)benzyliridium-(III) (7). Reddish purple solids (66%). ¹H NMR (CDCl₃, 300 MHz): δ -3.99 (s, 2 H), 2.69 (s, 12 H), 3.16 (d, 2 H, *J* = 6.9 Hz), 5.88–5.93 (m, 2 H), 6.45 (t, 1 H, *J* = 7.5 Hz), 7.51 (t, 8 H, *J* = 6.0 Hz), 7.96–8.03 (m, 8 H), 8.47 (s, 8 H). HRMS (FABMS): calcd for [C₅₅H₄₃N₄Ir]⁺, *m/z* 925.3116; found, *m/z* 925.3117. Anal. Calcd for C₅₅H₄₃N₄Ir·3H₂O: C, 65.65; H, 4.90; N, 5.57. Found: C, 65.94; H, 4.38; N, 5.19.

Reaction of (Porphyrinato)iridium(III) Alkyls with TEMPO. (5,10,15,20-Tetratolylporphyrinato)(2-phenyl-2-oxoethyl)iridium(III) (Ir(tp)CH₂C(O)C₆H₅, **8b**) is described as a typical procedure. Ir(tp)CH₂CH₂C₆H₅ (**1b**), recrystallized from CH₃OH/CH₂Cl₂ (0.02 mmol), and TEMPO (49 mg, 0.31 mmol) were dissolved in anhydrous benzene (1.0 mL) in a Teflon screw-capped tube. The solution was degassed in three freeze-thaw-pump cycles and filled with N₂. The solution was protected from light and heated in an oil bath at 80 °C. The progress of the reaction was monitored by ¹H NMR spectroscopy. The crude mixture was then dried under high vacuum and purified by silica gel column chromatography using hexane/CH₂Cl₂ (4:1) as the eluent. The major red fraction was collected. A reddish purple solid (16 mg, 0.016 mmol, 78%) was obtained. ¹H NMR (CDCl₃, 300 MHz): δ -3.88 (s, 2 H), 2.68 (s, 8 H), 4.75 (d, 2 H, *J* = 7.8 Hz), 6.59–6.64 (m, 2 H), 7.02 (t, 1 H, *J* = 7.2 Hz), 7.48 (t, 8 H, *J* = 6.8 Hz), 7.87 (d, 2 H, *J* = 6.8 Hz), 7.93 (d, 2 H, *J* = 7.5 Hz), 8.46 (s, 8 H). IR (KBr):

$\nu(\text{C}=\text{O})$ 1629 (s) cm^{-1} . HRMS (FABMS): calcd for $[\text{C}_{56}\text{H}_{43}\text{N}_4\text{OIr}]^+$, m/z 980.3061; found, m/z 980.3070. Anal. Calcd for $\text{C}_{56}\text{H}_{43}\text{N}_4\text{OIr}\cdot\text{CH}_3\text{OH}$: C, 67.88; H, 5.10; N, 5.33. ^{13}C NMR (CDCl_3 , 75 MHz): δ 21.9, 50.8, 124.1, 125.7, 127.1, 127.7, 127.9, 130.8, 131.9, 133.9, 134.5, 137.5, 139.2, 143.4. ^1H NMR (1 equiv of $\text{PPh}_3/\text{CDCl}_3$, 300 MHz): δ -4.91 (d, 2 H, $^3J_{\text{PH}} = 13.5$ Hz), 2.66 (s, 8 H), 3.96 (t, 8 H, $J = 7.6$ Hz), 4.72 (d, 2 H, $J = 8.1$ Hz), 6.65–6.56 (m, 9 H), 6.80–6.85 (m, 2 H), 6.91 (t, 1 H, $J = 7.6$ Hz), 7.43 (d, 8 H, $J = 8.2$ Hz), 7.58–7.81 (m, 8 H), 8.40 (s, 8 H).

(5,10,15,20-Tetratolylporphyrinato)[2-(4-methoxyphenyl)-2-oxoethyl]iridium(III) (Ir(ttp) $\text{CH}_2\text{C}(\text{O})\text{C}_6\text{H}_4\text{OCH}_3$, 8a). ^1H NMR (CDCl_3 , 300 MHz): δ -3.85 (s, 2 H), 2.68 (s, 8 H), 3.70 (s, 3 H), 4.72 (d, 2 H, $J = 8.8$ Hz), 6.09 (d, 2 H, $J = 8.8$ Hz), 7.49–7.53 (t, 8 H), 7.90–7.98 (m, 8 H), 8.49 (s, 8 H). ^{13}C NMR (CDCl_3 , 75 MHz): δ 22.0, 30.1, 55.6, 124.2, 127.6, 127.7, 127.8, 128.0, 129.0, 131.9, 133.9, 137.6, 139.1, 140.9, 143.4. IR (KBr): $\nu(\text{C}=\text{O})$ 1633 (s) cm^{-1} . HRMS (FABMS): calcd for $[\text{C}_{57}\text{H}_{45}\text{N}_4\text{O}_2\text{Ir}]^+$, m/z 1010.3166; found, m/z 1010.3151.

(5,10,15,20-Tetratolylporphyrinato)[2-(4-methylphenyl)-2-oxoethyl]iridium(III) (Ir(ttp) $\text{CH}_2\text{C}(\text{O})\text{C}_6\text{H}_4\text{CH}_3$, 8c). ^1H NMR (CDCl_3 , 300 MHz): δ -3.83 (s, 2 H), 2.21 (s, 3 H), 2.69 (s, 8 H), 4.67 (d, 2 H, $J = 7.8$ Hz), 6.42 (d, 2 H, $J = 7.8$ Hz), 7.49 (t, 8 H, $J = 6.0$ Hz), 7.88–7.99 (m, 8 H), 8.49 (s, 8 H). ^{13}C NMR (CDCl_3 , 75 MHz): δ 21.9, 23.2, 30.1, 124.2, 125.7, 127.7, 127.8, 128.5, 131.8, 133.8, 134.4, 137.5, 139.1, 143.4. IR (KBr): $\nu(\text{C}=\text{O})$ 1621 (s) cm^{-1} . HRMS (FABMS): calcd for $[\text{C}_{57}\text{H}_{45}\text{N}_4\text{OIr}]^+$, m/z 994.3217; found, m/z 994.3220.

(5,10,15,20-Tetratolylporphyrinato)[2-(4-chlorophenyl)-2-oxoethyl]iridium(III) (Ir(ttp) $\text{CH}_2\text{C}(\text{O})\text{C}_6\text{H}_4\text{Cl}$, 8d). ^1H NMR (CDCl_3 , 300 MHz): δ -3.92 (s, 2 H), 2.69 (s, 8 H), 4.65 (d, 2 H, $J = 7.8$ Hz), 6.58 (d, 2 H, $J = 7.8$ Hz), 7.49 (d, 4 H, $J = 7.7$ Hz), 7.53 (d, 4 H, $J = 7.7$ Hz), 7.87 (d, 4 H, $J = 7.7$ Hz), 7.92 (d, 4 H, $J = 7.7$ Hz), 8.49 (s, 8 H). ^{13}C NMR (CDCl_3 , 75 MHz): δ 22.0, 30.1, 124.4, 127.0, 127.3, 127.8, 128.0, 131.9, 133.9, 134.3, 137.7, 138.9, 143.3. IR (KBr): $\nu(\text{C}=\text{O})$ 1621 (s) cm^{-1} . HRMS (FABMS): calcd for $[\text{C}_{56}\text{H}_{42}\text{N}_4\text{OClIr}]^+$, m/z 1014.2671; found, m/z 1014.2676.

Reaction of (5,10,15,20-Tetratolylporphyrinato)ethyliridium(III) (3) with TEMPO. The solution was protected

from light and heated in an oil bath at 160 °C for 2 days. Ir(ttp)Et (3; 13 mg, 53%) was recovered. ^1H NMR (CDCl_3 , 300 MHz): δ -5.55 (q, 2 H, $J = 9.0$ Hz), -4.63 (t, 3 H, $J = 9.0$ Hz), 2.68 (s, 12 H), 7.49 (t, 8 H, $J = 5.4$ Hz), 7.95 (m, 8 H), 8.50 (s, 8 H).

Reaction of (5,10,15,20-Tetratolylporphyrinato)propyliridium(III) (4) with TEMPO. The solution was protected from light and heated in an oil bath at 160 °C for 2 days. Ir(ttp)Me (6; 8 mg, 43%) was isolated. ^1H NMR (CDCl_3 , 300 MHz): δ -6.33 (s, 3 H), 2.68 (s, 12 H), 7.50 (d, 8 H, $J = 6.0$ Hz), 7.19–8.04 (m, 8 H), 8.51 (s, 8 H).

Reaction of (5,10,15,20-Tetratolylporphyrinato)(3-phenylpropyl)iridium(III) (5) with TEMPO. The solution was protected from light and heated in an oil bath at 160 °C for 2 days. Ir(ttp) $\text{CH}_2\text{CH}_2\text{CH}_2\text{Ph}$ (5; 15 mg, 79%) was recovered. ^1H NMR (CDCl_3 , 300 MHz): δ -5.15 (t, 2 H, $J = 9.0$ Hz), -4.14 (p, 2 H, $J = 9.0$ Hz), -0.35 (t, 2 H, $J = 9.0$ Hz), 2.68 (s, 12 H), 5.55 (d, 2 H, $J = 6.6$ Hz), 6.71–6.78 (m, 3 H), 7.48 (t, 8 H, $J = 7.8$ Hz), 7.89 (d, 4 H, $J = 7.8$ Hz), 8.02 (d, 4 H, $J = 7.8$ Hz), 8.50 (s, 8 H).

Reaction of (5,10,15,20-Tetratolylporphyrinato)(methyl- d_3)iridium(III) (6- d_3) with TEMPO. The solution was protected from light and heated in an oil bath at 160 °C for 7 days. Ir(ttp) CD_3 (6- d_3 ; 11 mg, 62%) was recovered. ^1H NMR (CDCl_3 , 300 MHz): δ 2.68 (s, 12 H), 7.50 (d, 8 H, $J = 6.0$ Hz), 7.19–8.04 (m, 8 H), 8.51 (s, 8 H).

Reaction of (5,10,15,20-Tetratolylporphyrinato)benzyliridium(III) (7) with TEMPO. The solution was protected from light and heated in an oil bath at 160 °C for 6 days. Ir(ttp)Bn (7; 13 mg, 71%) was recovered. ^1H NMR (CDCl_3 , 300 MHz): δ -3.99 (s, 2 H), 2.69 (s, 12 H), 3.16 (d, 2 H, $J = 6.9$ Hz), 5.88–5.93 (m, 2 H), 6.45 (t, 1 H, $J = 7.5$ Hz), 7.51 (t, 8 H, $J = 6.0$ Hz), 7.96–8.03 (m, 8 H), 8.47 (s, 8 H).
