## New Carbon-Carbon Bond Formation through Oxyallylation of Enoxysilanes with Sulfur Dioxide Adduct of 1-Methoxybutadiene. Stereoselective Synthesis of (Z)-4-Methoxy-6-oxoalk-2-enyl Methyl Sulfones.

## Brigitte Deguin, 1 Jean-Michel Roulet 2 and Pierre Vogel\*

Section de Chimie de l'Université de Lausanne, BCH, CH 1015 Lausanne-Dorigny, Switzerland.

Abstract: Mixtures of 1-methoxybutadiene, trimethylsilyl enol ethers, SO<sub>2</sub> and a Lewis acid catalyst generate trimethylsilyl (Z)-4-methoxy-6-oxoalk-2-enesulfinates that can be converted into 4-methoxy-6-oxoalk-2-enyl methyl sulfones and 5-alkyl-4-methoxy-6-oxoalk-2-enyl methyl sulfones with 100% (Z) selectivity and good syn diastereoselectivity for the 5-alkyl and 4-methoxy substituents. © 1997 Elsevier Science Ltd.

At low temperature and in the presence of a suitable protic or Lewis acid catalyst, simple 1,3-dienes add reversibly to sulfur dioxide via a hetero-Diels-Alder process giving the corresponding 3,6-dihydro-1,2-oxathiin-2-oxides (= sultines).<sup>3,4</sup> For isoprene, (E)-piperilene<sup>3</sup> and (E)-hexa-1,3-diene,<sup>5</sup> equilibrium constants K = [sultine]/[SO<sub>2</sub>]-[1,3-diene] lie between 10<sup>-4</sup> to 10<sup>-2</sup> mol<sup>-1</sup>dm<sup>3</sup> at -60°C. The sultines are unstable above -50°C and undergo fast cycloreversion liberating the starting diene and SO<sub>2</sub> that undergo cheletropic additions<sup>5</sup> above -40°C giving the corresponding 2,5-dihydrothiophene-1,1-dioxides (sulfolenes).<sup>6</sup> Electron-rich 1,3-dienes such as 1-methoxybutadiene (1), react with SO2 at -60°C without acid catalysis providing quantitative formation of a single adduct  $(K = [adduct]/[1][SO_2] > 3 \text{ mol}^{-1}dm^3)$  the structure of which was assigned as sultine 2 on the basis of its <sup>1</sup>H- and <sup>13</sup>C-NMR data. <sup>7</sup> Although the alternative sulfolene structure 3 could not be ruled out, this result suggested to us that this adduct, contrary to the sultine derived from alkyl-substituted 1,3-dienes, could be used as a synthetic intermediate as it was shown to be stable up to -30°C in the presence of an excess of SO2. Similar results were obtained with 1-methoxy-3-[(trimethylsilyl)oxy]buta-1,3-diene (Danishefsky's diene). Above -20°C 2 (or 3) decomposes quickly into polymeric material. In the presence of a Lewis acid (LA) adduct 2 (or 3) was expected to undergo ring opening with the formation of a zwitterionic intermediate of type 4 which should react with electron-rich alkenes either as an oxy-allylating agent, giving cationic intermediates of type 5, or as an allylating agent leading to intermediates of type 6.

We report herein our preliminary results which demonstrate that only mode  $4 \rightarrow 5$  is followed with enoxysilanes, realizing a new oxyallylating process and a new method to create carbon-carbon bonds with the

generation of polyfunctional (Z)-alkenes. Good syn-diastereoselectivity has been observed for the oxyallylation of (Z)- and (E)-enoxysilanes derived from diethyl ketone and cyclohexanone, respectively. The method is illustrated with the stereoselective synthesis of (Z)-4-methoxy-6-oxoalk-2-enyl methyl sulfones.

In a typical experiment, a 1:2 mixture of diene 1 and enoxysilane 7a, derived from acetophenone, were dissolved in CH<sub>2</sub>Cl<sub>2</sub> containing 0.01 molar-equivalents of Yb(OTf)<sub>3</sub>.8 After degassing (freeze/ thaw cycles), SO<sub>2</sub> was condensed and the reaction mixture allowed to

stand at -78°C for 4-6 h. Under these conditions the Lewis acid catalyses the addition of  $SO_2$  to 1 generating 2 (or 3) faster than the sila-ene reaction of 7a with  $SO_2$ . The Lewis acid induces the oxyallylation of 7a leading to the unstable trimethylsilyl sulfinates 8a. After disappearance of 1, the excess  $SO_2$  was distilled off at -78°C. Acetone (solvent) and a THF solution of  $Bu_4N^+F^-$  (TBAF) were added and the mixture allowed to warm up to 0°C. This generated the tetrabutylammonium sulfinates 9a that were reacted with an excess of MeI (0°C, 90 min)<sup>9</sup> to provide the (Z)-alkenyl methyl sulfone 10a (71%).<sup>10,11</sup> The same procedure, when applied to the trimethylsilyl enol ether of 3,3-dimethylbutan-2-one (7b), led to 10b in 60-75% yield.

With the (Z)-enoxysilane 11 derived from diethyl ketone,  $^{12}$  the oxyallylation with 2 (or 3) engendered diastereomeric adducts that were converted, as above, to the *syn* and *anti*  $\beta$ -methoxy- $\alpha$ -methyl ketones 12 and 13,  $^{13}$  respectively. These compounds were separated and purified by flash column chromatography on silica gel (yield up to 89%, based on 1). The diastereoselectivity (12/13 product ratio) depended somewhat on the nature of the Lewis acid catalyst (see Table) and was highest (81:19) with (t-Bu)Me<sub>2</sub>SiOTf.

Lewis acid	mol. equiv.	12/13 <sup>a)</sup>	yield <sup>b)</sup>
Yb(OTf) <sub>3</sub>	0.02	70:30	89%
Sc(OTf) <sub>3</sub>	0.03	70:30	81%
Sn(OTf) <sub>2</sub>	0.04	70:30	76%
Me <sub>3</sub> SiOTf	0.37	75:25	78%
(t-Bu)Me <sub>2</sub> SiOTf	0.43	81:19	63%

The relative configurations of 12 and 13 were established in the following way: reduction of the sym product 12 with L-Selectride (Li(s-Bu)<sub>3</sub>BH)<sup>14</sup> (THF, -78°C), followed by treatment with  $H_2O_2/NaOH$ , generated the sym alcohol 14 (47%, 40% of recovered 12), the ozonolysis of which ( $O_3$ , CH<sub>2</sub>Cl<sub>2</sub>, -78°C, then Me<sub>2</sub>S, 20°C) produced aldehyde 15 that equilibrated with a 5:3 mixture of the  $\alpha$ - and  $\beta$ -furanose  $\alpha$ -16 and  $\beta$ -16 (69%). The 2D-NOESY <sup>1</sup>H-NMR (400 MHz) spectrum of these two compounds proved the trans relationship between the methoxy and methyl substituents, and thus the sym relative configuration of 12.

OH OMe 
$$\frac{1. O_3}{2. \text{ Me}_2 \text{S}}$$
 OH OMe  $\frac{1. O_3}{2. \text{ Me}_2 \text{S}}$   $\alpha$ -16  $\beta$ -16

The oxyallylation of the trimethylsilyl enol ether of cyclohexanone (17) with 2 (or 3) generated a mixture of adducts 18 and 19 which was converted, as above, into the corresponding sulfones 20 and 21. With various Lewis acids the *syn* diastereomer 20 was always favoured. The best diastereoselectivity was observed with (*i*-Pr)<sub>3</sub>SiOTf (0.37 mol equiv.) which led to a 83:17 mixture of 20/21 (74%). With (*t*-Bu)Me<sub>2</sub>SiOTf, it was 81:19 (88% yield). The relative configurations of 20 and 21 were established by chemical correlation with the known derivatives 26 and 27<sup>16</sup> that were obtained in the following way: instead of reacting the intermediate sulfinates 18 and 19 with TBAF, they were hydrolyzed with an aqueous methanolic solution of NH<sub>4</sub>Cl. The corresponding sulfinic acids 22 and 23 underwent retro-ene eliminations of SO<sub>2</sub> at 20°C giving the terminal alkenes 24 and 25 that were hydrogenated to provide 26 and 27, respectively. On the corresponding sulfinite acids 20°C giving the terminal alkenes 24 and 25 that were hydrogenated to provide 26 and 27, respectively.

As for the Mukaiyama reaction,  $^{18}$  our oxyallylations with 11 and 17 show preference for the *syn* diastereomers irrespective of the enoxysilane (Z) or (E)-geometry.  $^{19}$  Although more data must be collected before reasonable transition state models can be discussed for our reactions, the available results are consistent with the Noyori open chain models  $^{16}$ ,  $^{19}$ ,  $^{20}$  shown here-below (minimal steric and electrostatic repulsions).

Our work demonstrates for the first time that SO<sub>2</sub> can be used to promote carbon-carbon bond formation between an electron-rich 1,3-diene and an electron-rich alkene

without polymerization. A new oxyallylation process is disclosed that can be applied to the synthesis of 6-oxo-4-methoxy-5-alkylalk-2-enyl methyl sulfones with 100% (Z) selectivity for the olefinic moiety and good syn diastereoselectivity for the 4-methoxy- and 5-alkyl-substituted centers. Work is underway in our laboratory to extend the new chemistry disclosed here.

Acknowledgments. We thank the Swiss National Science Foundation, the Fonds Herbette and the Fonds Agassiz (Lausanne) for generous financial support.
