Abstract—The reaction of dichlorodiethyl ether or dichlorodiethylamine hydrochloride with potassium or ethanolammonium dichalcogenides prepared in situ from elemental sulfur or selenium in the system hydrazine hydrate–alkali results in oligomeric dichalcogenides, whose further splitting at the chalcogen–chalcogen bond in the same system and subsequent alkylation affords bis(organylsulfanyl)- or bis(organylselanyl)-substituted derivatives of diethyl ether or diethylamine. Ligands with aryl substituents at the chalcogens have been prepared in 48-59% yield by splitting of diaryldichalcogenides in the system hydrazine hydrate–alkali and subsequent reaction with dichlorodiethyl ether or dichlorodiethylamine. A ditopic tetradentate ligand has been synthesized by the use of dichlorodiethylformal.

Keywords: sulfur, selenium, dichalcogenides, polydentate ligands, hydrazine hydrate

DOI: 10.1134/S1070363217030069

The chalcogen atoms in organic molecules are capable of formation of strong coordination bonds with heavy metal ions [1]. Especially stable chelate complexes are formed when two or more donor centers are present in the ligand [1]. Complexes of this type are of interest for coordination chemistry [2, 3], for the design of analytical reagents [4] and selective sensors [5–7] and are used for the analysis and investigation of coordination compounds of noble metals [8]. Especially promising is the use of metal complexes with chalcogen-containing ligands in homogeneous catalysis [9, 10]. Thus, palladium complexes with organochalcogen ligands were proposed as catalysts in the Suzuki reaction [11]. An important feature of complexes used in homogeneous catalysis is their ability to reduce the coordination number of the complex-forming metal [12]. As a result, coordinatively unsaturated complexes are formed, which can interact with the molecules of the reagents to continue the catalytic cycle. Since the chalcogen atoms, as soft bases, form strong bonds with many transition metal ions (soft acids), for the formation of

labile metal-ligand bonds the presence of hard donor centers in the structure of the latter is necessary, for example, the oxygen or nitrogen atoms.

These requirements are fulfilled in polydentate ligands containing between the donor atoms the chain of two carbon atoms, which favors the formation of the energetically stable five-membered chelate cycles upon the formation of complexes with metals. Within this group of ligands the derivatives of diethyl ether and diethylamine containing additional chalcogenide substituents are intensively studied [3, 4, 6-11]. The data on the synthesis of oxa- and aza-substituted bischalcogenide ligands of this type are scarce. The known methods are mostly based on the use of 2,2'dichloroethyl ether (chlorex) 1a and the salts of 2.2'dichlorodiethylamine 1b as the reagents. A multistep synthesis of bis(2-methylsulfanyl)diethylether in 61% yield from chlorex via the steps of formation of the double isothiuronium salt with its subsequent transformation to the corresponding dithiol and methylation of the latter with methyl iodide has been described

[13]. For the synthesis of dibenzylsulfanyl derivative instead of chlorex diethylene glycol ditosylate is used. whose reaction with benzylthiuronium chloride in the presence of solid alkali and a phase transfer catalyst gives the target product in 30-55% yield [14]. Dichalcogen-substituted derivatives of diethylamine were prepared in 69-89% yield by the reaction of dichlorodiethylamine with thiolates or selenolates of alkali metals [5, 6, 10, 11, 15–21]. For the synthesis of bisphenylselanyl derivative of 3-azapentylene diphenyldiselenide was used, which was reduced to phenylselenolate by the reaction with NaBH₄ [6]. All reactions with thiolates and selenolates were carried out in inert atmosphere. The above brief inventory of the methods of synthesis of bischalcogenyl-substituted derivatives of diethyl ether and diethylamine shows that they are laborious and that elaboration of synthetically efficient methods for preparation of polydentate ligands containing oxa- or aza-groups in the molecule, as well as with two organylsulfanyl or -selanyl moieties is actual.

In the present work two methods of the synthesis of 1,5-diorganylchalcogenide-3-oxa(3-aza)pentylenes **2a–2j** are worked out based on the use of chlorex **1a** or dichlorodiethylamine hydrochloride **1b**, elemental sulfur, selenium or diorganyldichalcogenides in the system hydrazine hydrate–base.

Elemental chalcogens and diorganyldichalcogenides in the system hydrazine hydrate–base are reduced to polychalcogenides or potassium organylchalcogenolates [22]. The reduction of sulfur or selenium to disulfide or diselenide anion proceeds rather selectively using either the system hydrazine hydrate–monoethanolamine (molar ratio N₂H₄·H₂O : H₂NCH₂CH₂OH = 10 : 1) or the system hydrazine hydrate–KOH with the molar ratio Y : KOH=1 : 1 [22] (Scheme 1).

Scheme 1.

$$\begin{split} 4Y + 4KOH + N_2H_4 \cdot H_2O &\rightarrow 2K_2Y_2 + N_2 + 5H_2O, \\ 4Y + N_2H_4 \cdot H_2O + 4HOCH_2CH_2NH_2 \\ &\rightarrow 2(HOCH_2CH_2NH_3)_2Y_2 + N_2 + H_2O, \\ 4Y + 5N_2H_4 \cdot H_2O &\rightarrow 2(N_2H_5)_2Y_2 + N_2 + 5H_2O, \\ Y = S, Se. \end{split}$$

The obtained anionic forms of chalcogens were used in further syntheses without isolation as individuals.

The reductive splitting of diorganyldichalcogenides proceeds by Scheme 2. For effective proceeding of the

reaction an excess of alkali was used, R_2Y_2 : KOH = 1 : 5. Chalcogenolates **3a–3c** either were not isolated as individuals.

Scheme 2.

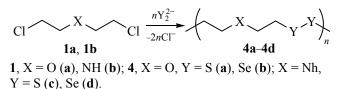

$$2R_2Y_2 + N_2H_2 \cdot H_2O + 4KOH \rightarrow 4RYK + N_2 + 5H_2O,$$

$$3a-3c$$

$$R = Ph, Y = S (a), Se (b); R = Bn, Y = S (c).$$

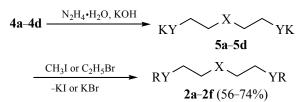

Alkylchalcogenide tridentate ligands 2a-2f were obtained using active forms of chalcogens prepared as in Scheme 1. Polycondensation of dihaloderivatives 1a and 1b with dichalcogenide anions gives oligomeric dichalcogenides 4a-4d (Scheme 3).

Scheme 3.

The reductive splitting of oligomers 4a-4d at the Y-Y bond using the system hydrazine hydrate-KOH results in the formation of dichalcogenolates 5a-5d, which were further alkylated with alkyl halides affording the target products 2a-2f (Scheme 4).

Scheme 4.

5, X = O, Y = S (**a**), Se (**b**); X = NH, Y = S (**c**), Se (**d**); **2**, X = O, Y = S, $R = CH_3$ (**a**), C_2H_5 (**b**), Y = Se, $R = CH_3$ (**c**), C_2H_5 (**d**); X = NH, Y = S, $R = CH_3$ (**e**), Y = Se, $R = CH_3$ (**f**).

Oligomeric dichalcogenides **4a**, **4b** we obtained earlier [23, 24] when studying the reactions of dielectrophiles (including chlorex) with elemental chalcogens in the system hydrazine hydrate–base. Oligomer **4a** was obtained in 62% yield and had the average molecular mass equal to 1770, as defined by the method of terminal groups [23]. Oligomer **4b** was isolated in 75% yield and had molecular mass of 1730 [24]. The structure of the obtained oligomers was proved by the method of reductive splitting. The synthesis and reductive splitting of oligomers **4c**, **4d** is performed for the first time. The compounds are viscous black substances. Oligomer **4c** was obtained in

Table 1. Yields, boiling points, elemental analysis, and IR spectra of compounds 2a-2j

70% yield with molecular mass 1460, oligomer **4d** in 96% yield and molecular mass 6400. Therefore, we have realized the preparative synthesis of compounds 2a-2f via the intermediate dichalcogenide oligomers.

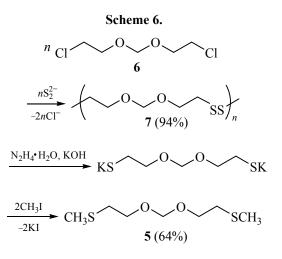

For the synthesis of arylchalcogenide and benzylchalcogenide ligands 2g-2j we have used an alternative approach based on the reaction of chalcogenolates 3a-3c with chlorex 1a or with dichlorodiethylamine hydrochloride 1b (Scheme 5). The yields, data of elemental analysis and IR spectroscopy of compounds 2a-2j are given in Table 1, the data of ¹H and ¹³C NMR spectra, in Table 2.

1, X = O(a), NH (b); **2**, X = O, Y = S, R = Ph(g), Bn (h), Y = Se, R = Ph(i), X = NH, Y = S, R = Ph(j); **3**, R = Ph, Y = S (a), Se (b); R = Bn, Y = S(c).

Using the approach represented in Schemes 1, 3, and 4, we have first synthesized a ditopic tetradentate ligand, 1,10-dithia-5,7-dioxaundecane **5** by the reaction of 2,2-dichlorodiethylformal **6** and sulfur preliminary reduced in the system hydrazine hydrate–monoethanol-amine via the stage of formation of oligomeric disulfide 7 (Scheme 6). Oligomer 7 was prepared in 94% yield as a highly viscous gray substance; its

Table 2. ¹H, ¹³C, ⁷⁷Se NMR spectra of compounds **2a–2j**, chemical shifts, δ, ppm

molecular mass was about 1000. The splitting of oligomer 7 at the S–S bonds and the subsequent alkylation results in the formation of compound 5.

Therefore, the use of basic-reductive systems on the basis of hydrazine hydrate allows synthesizing dichalcogenide polydentate ligands of linear structure, promising reagents for the design of chelate complexes with participation of heavy metal ions.

EXPERIMENTAL

IR spectra were recorded on a Bruker IFS-25 spectrophotometer from thin layers. ¹H, ¹³C, ⁷⁷Se NMR spectra were registered on a Bruker DPX-400 spectrometer (400.13, 100.62, and 76.31 MHz respectively) in DMSO- d_6 or CDCl₃ solution, internal reference TMS (¹H, ¹³C) and Me₂Se (⁷⁷Se). Mass spectra were taken on a Shimadzu GCMS–QP5050A

chromatomass spectrometer (column SPB-5, 60000×0.25 mm, quadruple mass analyzer, electron ionization, 70 eV, temperature of ion source 190°C, the range of detected masses 34–650 Da). The purity of the products and the course of the reactions were monitored by GC on a LKhM 80-MD-2 chromatograph (column 2000×3 mm, liquid phase DC-550, 5% on Chromaton N-AW-HMDS, linear programming of the temperature with the heating rate 12 deg/min, gas carrier helium).

Oligomers **4a,b** were synthesized as described earlier [23, 24]. The oligomers were also prepared by the use of the system hydrazine hydrate–mono-ethanolamine [25].

Poly(3-azapentylene disulfide) (4c). To the solution of 1.26 g (0.0224 mol) of KOH and 1.1 mL of hydrazine hydrate in 7 mL of water 0.72 g (0.0224 mol) of elemental sulfur was added by portions, the reaction mass was stirred for 5 h at 85-90°C, cooled, 6 mL of 10% KOH and 2.0 g (0.0112 mol) of dichlorodiethylamine hydrochloride 1b was added. The obtained mixture was stirred for 2 h at 60-65°C, cooled, the formed oligomer was separated by decanting, washed with water, ethanol, ether, dried in a vacuum to a constant mass, 1.13 g (75%) of oligomer 4c was obtained as a viscous compound of black color. IR spectrum, v, cm⁻¹: 3291, 2920, 2820, 1455, 1358, 1285, 1122, 1003, 752. Found, %: C 34.96, H 6.67, Cl 4.86, N 10.61, S 43.63. C₄₄H₉₈N₁₁Cl₂S₂₀. Calculated, %: C 35.41, H 6.57, Cl 4.76, N 10.33, S 42.92. The molecular mass determined by the residual chlorine was 1460, which corresponded to n = 11.

Poly(3-azapentylenediselenide) (4d) was prepared similarly. Yield 3.28 g (96%) of oligomer **4g** as a viscous mass of black color. IR spectrum, v, cm⁻¹: 3283, 2921, 2815, 1455, 1407, 1356, 1261, 1221, 1179, 1116, 975, 797, 735, 643, 547. Found, %: C 20.61, H 4.11, Cl 1.11, N 5.90, Se 69.39. $C_{112}H_{252}N_{28}Cl_2Se_{54}$. Calculated, %: C 20.98, H 3.96, Cl 1.12, N 6.12, Se 68.94. The molecular mass determined by the residual chlorine was 6400, which corresponded to n = 28.

Compounds 2a–2f (general procedure). 20% KOH solution in hydrazine hydrate and the calculated amount of oligomer **4a–4d** (molar ratio n : KOH = 1 : 5) was stirred for 3.5 h at 85–90°C, the reaction mass was cooled to 25°C and MeI or EtBr was added dropwise [n : AlkHlg = 1 : (2.2–3)] and the mixture was stirred for 2.5 h at 30–35°C and 4 h at 25°C. The product was

extracted with ether (2×50 mL), the extract was dried over MgSO₄, the solvent was removed, the residue was distilled in a vacuum.

Compounds 2g–2j (general procedure). 20% KOH solution in hydrazine hydrate and the calculated amount of diorganyl dichalcogenide R_2Y_2 (R_2Y_2 : KOH = 1 : 5) was stirred for 4 h at 85–90°C. the reaction mass was cooled to 60°C, 1 equivalent of chlorex **1a** or salt **1b** was added, the mixture was stirred for 5 h at 60–70°C, cooled to 25°C, the product was extracted with ether (2×50 mL), the extract was dried over MgSO₄, the solvent was removed. Compounds **2g**, **2j** were distilled in a vacuum, compounds **2h**, **2i** were analyzed without distillation.

Polv(3,5-dioxaheptvlenedisulfide) (7). 3 mL of hydrazine hydrate, 0.34 g (0.0056 mol) of ethanolamine, and 1.12 g (0.035 mol) of elemental sulfur was stirred for 2.5 h at 60-65°C. The reaction mass was cooled to 25°C, 3.0 g (0.0173 mol) of dichlorodiethylformal was added dropwise and the mixture was stirred for 4 h at 75-80°C. After cooling, oligomer 7 was separated by decantating as a viscous mass. Yield 2.7 g (94%). IR spectrum, v, cm⁻¹: 2921, 2870, 2801, 1466, 1412, 1377, 1282, 1197, 1154, 1115, 1072, 1029, 951, 812, 791, 758, 666, 620, 477. ¹H NMR spectrum (DMSO-*d*₆), δ, ppm: 2.93 m (4H, CH₂S), 3.73 m (4H, CCH₂O), 4.66 s (2H, OCH₂O). ¹³C NMR spectrum (DMSO-*d*₆), δ, ppm: 38.14 (CH₂S), 65.56 (CCH₂O), 94.62 (OCH₂O). Found, %: C 35.50, H 6.27, S 29.05, Cl 7.79. C_{27.5}H₅₅Cl₂S₉. Calculated, %: C 36.26, H 6.04, S 31.65, Cl 7.80. The molecular mass determined by the residual chlorine was 910, which corresponded to n = 5 - 6.

5,7-Dioxa-2,10-dithiaundecane (5). A mixture of 2.97 g (0.053 mol) of KOH, 13 mL of hydrazine hydrate, and 1.76 g (0.0106 mol) of oligomer 7 was stirred for 3 h at 85-90°C. The reaction mass was cooled to 25°C, 4.52 g (0.0318 mol) of methyl iodide was added dropwise, the mixture was stirred for 2 h at 30-35°C and 4 h at 25°C. The product was extracted with ether (2×50 mL), the extract was dried over MgSO₄ and evaporated. The residue was distilled in a vacuum. Yield 1.33 g (64%), colorless liquid, bp 102-105 (2 mmHg). IR spectrum, v, cm⁻¹: 2918, 2873, 2792, 1463, 1428, 1380, 1287, 1203, 1155, 1112, 1074, 1027, 954, 775, 726, 698, 659, 618, 475. ¹H NMR spectrum (CDCl₃), δ , ppm: 2.14 s (6H, CH₃), 2.71 t (4H, ³J 6.6 Hz, CCH₂O), 4.72 s (2H, OCH₂O). ¹³C NMR spectrum (CDCl₃), δ, ppm: 15.88 (CH₃),

33.85 (CH₂S), 66.88 (CCH₂O), 95.31 (OCH₂O). Massspectrum, *m/z*: 196 [*M*]⁺, 75 [CH₃SCH₂CH₂]⁺. Found, %: C 42.67, H 8.42, S 32.10. C₇H₁₆O₂S₂. Calculated, %: C 42.86, H 8.21, S 32.66.

ACKNOWLEDGMENTS

This work was performed with the use of equipment of the Baikal Center for Collective Use.
