Merck Institute for Therapeutic Research, West Point, Pennsylvania 19486. Received November 5, 1980

The discovery that dihydroethacrynic acid and other (4-acylphenoxy)acetic acids possessed modest but significant uricosuric and diuretic activity prompted our investigation of the related 2,3-dihydro-5-acyl-2-benzofurancarboxylic acids. Synthetic routes to a number of these compounds are presented along with the structure activity relationships generated from studies in rats, dogs, and chimpanzee. Examination of the enantiomers of 6,7-dichloro-2,3-dihydro-5-(2-thienylcarbonyl)-2-benzofurancarboxylic acid (10c) in the chimpanzee revealed that all diuretic and saluretic activity is due to the (+) enantiomer 10d, while the (-) enantiomer 10e is responsible for all of the uricosuric activity. X-ray analysis showed that the (-) enantiomer 10e possesses the 2R configuration.

The mercurial phenoxyacetic acid diuretics, such as merbaphen and mersalyl, served as models which led to the discovery of the nonmercurial (4-acryloylphenoxy)acetic acid diuretics,<sup>2</sup> such as ethacrynic acid (1a). Sat-

urated analogues of 1a, such as "dihydroethacrynic acid"<sup>3</sup> (1b), were shown to possess both saluretic and uricosuric properties. Later, tienilic acid<sup>4</sup> (Ticrynafen, 1c) was shown to possess similar renal properties. This discovery, coupled with the observation that annulation of (4-acrylovlphenoxy)acetic acids and (indanyloxy)acetic acids to the corresponding dihydrobenzofurancarboxylic acids<sup>5,6</sup> 2 or dihydroindeno[5,4-b]furancarboxylic acids<sup>7,8</sup> 3 either maintained or improved diuretic activity, prompted us to an-

nulate several (4-acylphenoxy)acetic acids to the corresponding acyldihydrobenzofurancarboxylic acids 4. A preliminary disclosure of some of the medicinal chemistry<sup>9</sup> and pharmacology<sup>10</sup> of this series has been published. Herein we report a complete account of our research on this unique class of uricosuric diuretics.

Scheme IV

Scheme V

**Chemistry.** The synthetic route used to prepare acyldihydrobenzofurancarboxylic acids 10 is illustrated in Scheme I. The disubstituted phenol 5 was alkylated with allyl bromide to give the intermediate allyl ether, which underwent Claisen rearrangement at 250 °C to afford 6. Oxidation of 6 with peracetic acid gave the intermediate epoxide which, upon cyclization, afforded the benzofuran 7. Jones oxidation of 7 yielded the carboxylic acid 8. At the beginning of this study, 8 was acylated directly with the appropriate acyl chloride under Friedel-Crafts conditions to give 10 in low yield. Subsequently, the yield of 10 was doubled when ester 9, readily prepared by esterification with EtOH-concentrated  $H_2SO_4$ , was acylated under Friedel-Crafts conditions and then saponified.

Scheme II shows the synthesis of the acylbenzofurancarboxylic acid 12. Compound 10c was esterified, and the resultant ester was brominated with NBS, dehydrobrominated with DBN in Me<sub>2</sub>SO, and then hydrolyzed to give 12.

Schemes III and IV show the chemical modification of the carbonyl and carboxy groups. In Scheme III the carbonyl bridge of 10c was reduced to methylene 13 by zinc amalgam and HCl. The carbonyl group was reduced with KBH<sub>4</sub> in H<sub>2</sub>O to give carbinol 14. The carboxy group of 10c was reduced to give the corresponding carbinol 15 using borane in THF. The carboxy group was further modified by reduction of its methyl ester 11a with "Red-Al" at -78 °C to yield the carboxaldehyde 16 (Scheme IV). Scheme VI

Scheme VII

Figure 1. A computer-generated perspective drawing of 10e showing the correct absolute configuration.

Other carboxyl derivatives include the hydrazide 17 and guanidide 18, which were prepared by the reaction of the ester 11b with hydrazine and guanidine, respectively (Scheme V). To study the effect of carboxy surrogates, the tetrazole 21 was prepared by the reaction sequence shown in Scheme VI. The carbonyl moiety was replaced with a sulfonyl group by treating 9 with 2-thiophenesulfonyl chloride under Friedel-Crafts conditions to give 22 as shown in Scheme VII.

Resolution of 10c was accomplished by recrystallization of the (-)-cinchonidine salt to give the (+) enantiomer 10d and the (+)- $\alpha$ -methylbenzylamine salt to give the (-) enantiomer 10e.

X-ray Analysis of 10e. The absolute configuration of 10e from the X-ray experiments is 2R (see Figure 1). The two independent molecules of 10e in the crystals show different conformations for the dihydrofuran rings. In one

<sup>a</sup> All compounds are racemic except 10d and 10e whose absolute stereochemistry is as indicated in parentheses. <sup>b</sup> Calculated yield is based on the last synthetic step. <sup>c</sup> See Experimental Section. <sup>d</sup> Purified by dissolution in 1% N-methylpiperazine and precipation with 6 N HCl.

molecule the ring is virtually planar with a largest deviation of 0.02 Å from the least-squares plane through the fivemembered ring. However, the ring in the second molecule has a flattened envelope conformation with C2' 0.30 Å from the best plane formed by the other four atoms. One significant intermolecular contact of 2.80 Å, which presumably is a hydrogen bond, is formed between O10 and O9'.

## Structure-Activity Relationships

(A) Saluresis-Diuresis. General Discussion. The excretion of urine, Na<sup>+</sup>, K<sup>+</sup>, and Cl<sup>-</sup> were measured in experiments conducted in rats, dogs, and chimpanzees. For brevity, only the Na<sup>+</sup> excretion is reported here. The excretion of Cl<sup>-</sup> and urine generally paralleled that of Na<sup>+</sup>; thus, any of these parameters could be used for relative potency comparisons. A detailed pharmacological study of 10c-e by Fanelli et al has been published.<sup>11</sup>

**Rat Data.** The oral natriuretic activity of our 2,3-dihydro-5-acyl-2-benzofurancarboxylic acids and their derivatives at four dose levels is provided in Table II. Variants of the R group attached to the carbonyl include the 2-thienyl (10c), 2-furyl (10f), 3-thiadiazolyl (10g), benzyl (10h), phenyl (10i), 4-methoxyphenyl (10j), and methyl (10k). The heterocyclic analogues 10f,g are slightly more active than their aromatic counterparts 10h-j; maximal activity was observed with the 2-thienyl compound 10c. When the substituent R was methyl, as in 10k, the activity was very weak. The conversion of 10c to the corresponding benzofuran 12 resulted in a marked decrease in activity. The nuclear substituents also greatly influence

Figure 2. Oral 24-h rat Na<sup>+</sup> assay. (The assay is identical with that in Table II, footnote a, except that 0- to 24-h collections are taken and more doses are used.)

activity; as noted above, maximal activity is seen with the 6,7-dichloro compound 10c. The 6,7-dimethyl analogue 10b is much weaker than 10c, and the dechloro compound 10a has only marginal activity.

Reduction of the carbonyl function of 10c to afford the carbinol 14 and then the methylene compound 13 greatly reduces natriuretic activity. The replacement of the carbonyl group with a sulfonyl group as in 22 also markedly reduces the activity in this species.

The conversion of carboxylic acid 10c to the corresponding ethyl ester 11b, carboxaldehyde 16, hydrazide 17, and acylguanidine 18 results in retention of considerable activity. However, the conversion to the carbinol 15, nitrile 20, or tetrazole 21 greatly reduces the natriuretic

<sup>a</sup> Female rats (Charles River, 150-170 g) were maintained overnight on a sugar diet with water ad libitum. The test substance was dissolved in pure DMF and subsequently diluted with water (which contained 3 drops of ethanolamine per 100 mL) such that the final vehicle was 4% DMF. At the time of the test, animals were given the vehicle (as placebo) or test substance suspended in a final volume of 5.0 mL po. Rats were housed in groups of three in metabolism cages. Urine was collected for the 0- to 5-h interval in graduated cylinders and was analyzed for sodium, potassium, and chloride content. Animals that received placebo were run concurrently. Results are reported as milliequivalents per cage and are the geometric means of three cages per dose level. Standard methodology was used for determination of electrolyte levels. <sup>b</sup> Identical with the above rat test except Tween-80 was substituted for ethanolamine. This assay was used for 10c-f, furosemide, hydrochlorothiazide, tienilic acid and the placebo. <sup>c</sup> Milliequivalents of Na<sup>+</sup>  $\times$  100 per cage for control rats (placebo) was 6. d Fasted, male chimpanzees weighing 21-77 kg were immobilized with phencyclidine (which was shown not to affect the results) (1.0-1.5 mg/kg im plus 0.25 mg/kg iv as needed) and were prepared by catheterization for standard renal clearance studies using routing clinical aseptic procedure. Pyrogen-free inulin (iv) was used to measure glomerular filtration rate (GFR). Clearance of inulin, urate, and the excretion rates of Na<sup>+</sup>, K<sup>+</sup>, and Cl<sup>-</sup> were determined by standard Auto Analyzer techniques. (Inulin and urate in chimpanzee plasma are freely filterable.) Average control clearances were calculated from three 20-min consecutive periods. Drug-response values were derived as the average of eight 15-20 min clearance periods after oral administration of an aqueous solution of the compound through an indwelling nasal catheter. All data are reported as the difference between (average) treatment and control values obtained from single experiments. <sup>e</sup> 1 mg/kg iv.

activity. The enantiomers of 10c exhibited a marked difference in activity; the (+) enantiomer 10d possesses about twice the saluretic activity of the racemate. This is illustrated clearly by the data shown in Figure 2.

It can be seen from Table II that many of the subject compounds appear to have a higher natriuretic ceiling than tienilic acid and hydrochlorothiazide. A few of the compounds have a natriuretic ceiling as high or higher than that of furosemide. Figure 3 graphically illustrates that 10c, in the oral rat assay (Table II), has a higher ceiling than hydrochlorothiazide, tienilic acid, and furosemide and possesses a smoother dose-response relationship than the latter two drugs.

Chimpanzee Data (Table II). Since these data are generally derived from single experiments, one cannot assign relative potency values from this information. However, it can be seen that the structure-activity relationships correlate well with those observed in the rats, except for 10g which is relatively much less natriuretic in the chimpanzees than in the rats. Of special interest is the observation that the (+) enantiomer 10d of the racemate 10c possesses all of the natriuretic activity exhibited by the racemate, whereas the (-) enantiomer 10e is devoid of natriuretic activity. Because of the efficacy exhibited by 10c and 10d, the presumed site of action of these agents

Figure 3. Oral 5-h rat assay. (The criteria are the same as for Table II, footnote a.)

is the thick ascending limb of the loop of Henle. This is further substantiated by the fact that 10c inhibits shortcircuit current, a measure of active Cl<sup>-</sup> transport, across

<sup>a</sup> Conditioned female mongrel dogs, weighing approximately 20 kg in the postabsorptive state, were starved overnight and given 500 mL of water orally 1 h prior to induction of anesthesia with sodium pentobarbital (30 mg/kg, iv). After inducing anesthesia, each dog was catheterized and primed with creatinine (4 g as a 10% aqueous solution) injected sc in multiple sites. Prior to initiating clearance studies, 1.5 mL/kg of isoosmotic pH 7.4 phosphate buffer solution (20 mg of  $PO_4/kg$ ) was given iv as a priming injection; 3 mL/min of isoosmotic pH 7.4 buffer containing 4% mannitol (6.9 mg of  $PO_4/kg$ ) infused during the experiment. At the onset of timed clearances, the urinary bladder was emptied and replicate 15-min urine collections were made; venous blood samples were drawn at the midpoint of each period. Following this control phase, the test compound was given iv at 5 mg/kg over a 5-min period, and 15-min collections of urine were taken over a period of 2 h. Urinary electrolytes were assayed by standard methods. The data recorded were the average of the two highest consecutive 15-min collections. <sup>b</sup> 1 mg/kg.

Dog Data (Tables III and IV). In general, the compounds that exhibit good saluresis and diuresis in rats and chimpanzees give a comparable response when administered either intravenously or orally to dogs. The iv dog experiments were only designed to show that this species responds to these agents in a manner comparable to other loop diuretics. Time-action curves for selected members of this series will be published elsewhere. Of special interest are compounds 13 and 14, which show a relatively improved saluretic effect in the dog vis-a-vis that shown in the rat. The high ceiling and smooth dose-response of 10c is illustrated in Figure 4, where it is compared with tienilic acid, hydrochlorothiazide, and furosemide. That the diuretic activity resides in the (+) enantiomer 10d is shown in Figure 5, where 10d is shown to be about twice

<sup>a</sup> Oral tests were carried out on a colony of trained female mongrel dogs weighing 8-10 kg. All dogs received 100 mL of water the previous day and were fasted overnight. On the day of the test, 250 mL of water was administered orally, followed by 500 mL of water (orally) 1 h later. One hour after the last oral priming dose of water, bladders were emptied by catheterization and the study was commenced by administration of compound or placebo. Compounds were given in gelatin capsules and the animals were maintained in metabolism cages for collection of spontaneously voided urine. Spontaneously voided uring was combined with bladder uring collected by catheterization at the end of 5 Urine volumes were measured, and aliquots were h. analyzed for sodium, potassium, and chloride content by standard methodology. Values are reported as geometric means. <sup>b</sup> 20 mg/kg.

as natriuretic as the racemate 10c and the (-) enantiomer 10e has little or no activity. In this assay, tienilic acid has about one-fortieth the potency of 10c and one-eightieth that of 10d.

Figure 5. Oral 5-h dog assay. (The criteria are the same as for Table IV, footnote a.)

Uricosuria (Table II). Like the (4-acylaryloxy) acetic acid and indanylacetic acid diuretics, the acylbenzofuran-2-carboxylic acid diuretics are uricosuric in the chimpanzee. Although one cannot make quantitative structure-activity relationships from single oral experiments, some general trends can be noted. The ratio of saluretic to uricosuric activity is lower in 10h than in 10c. Compounds 10g and 12, which were saluretic in the rat and dog, are not uricosuric in the chimpanzee. The (-) enantiomer 10e is unique in that it possesses all of the uricosuric activity and very little of the saluretic activity of the racemate 10c.

Since (+) enantiomer 10d contributes the diuretic activity while (-) enantiomer 10e provides the uricosuric activity, various ratios of diuretic to uricosuric activity can be obtained by using the appropriate ratios of the two enantiomers. Table V provides the results of studying various enantiomeric ratios at various total doses in chimpanzees. In general, as the dose of 10d is increased, either alone or in combination with 10e, there is a corresponding increase in the saluretic response. Likewise, the greater the dose of 10e, either alone or in combination with 10d, the greater the uricosuric response. This is the first time, to the best of our knowledge, in which a virtually complete separation of saluretic and uricosuric activities in the enantiomers of a saluretic-uricosuric compound has been achieved. This is especially interesting since one enantiomer, 10e, presumably acts in the proximal tubule, the site of uricosuric action, whereas the other one, 10d, appears to exert its saluretic effects in the loop of Henle.

Thus, it has been possible to design and synthesize a class of potent saluretic-uricosuric agents in which any desired ratio of the two pharmacodynamic activities can be obtained by adjusting the enantiomeric ratio of the agent.

#### **Experimental Section**

<sup>1</sup>H NMR spectra were recorded on either a Varian T-60 or T-60-A spectrometer in  $CDCl_3$  unless otherwise noted. Chemical shifts are reported as  $\delta$  values with respect to Me<sub>4</sub>Si used as the internal standard. Specific rotations were determined with a Perkin-Elmer Model 141 polarimeter. Melting points were determined on a Thomas-Hoover capillary melting point apparatus and are uncorrected. Analyses are within ±0.4% of theoretical values when indicated by the symbols of the elements. Silica gel 60 (E. Merck, Darmstadt) was used for column chromatography. Organic extracts were dried over MgSO<sub>4</sub> and concentrated using a Buchi rotary evaporator under reduced pressure (ca. 20 mm).

2,3-Dichloro-6-propenylphenol (6c). A mixture of 5c (163 g, 1.0 mol),  $K_2CO_3$  (152 g, 1.1 mol), and DMF (500 mL) was heated at 60 °C with stirring for 30 min. The allyl bromide (127 g, 1.05 mol) was added dropwise over 20 min, and the reaction mixture was stirred for an additional hour at 60 °C and then poured into ice-H<sub>2</sub>O (2 L). The aqueous mixture was extracted with Et<sub>2</sub>O (4 × 200 mL). The organic extracts were combined, washed with brine (2 × 200 mL), dried, filtered, and evaporated to give the intermediate 2,3-dichloro-1-(propenyloxy)benzene as a red oil. This oily product was subjected to Clasien rearrangement by heating at 250 °C for 20 min. The resultant oil was distilled to yield 186.9 g (92%) of 6c: bp 132-134 °C (13 mm); NMR  $\delta$  3.40 (d, 2, J = 5 Hz, ArCH<sub>2</sub>), 4.87-5.30 (m, 2,  $CH_2$ =CH), 5.67-6.53 (m, 1, CH<sub>2</sub>=CH), 7.0 (s, 2, ArH). Anal. (C<sub>9</sub>H<sub>8</sub>Cl<sub>2</sub>O) H; C: calcd, 53.23; found, 52.37.

6,7-Dichloro-2,3-dihydro-2-(hydroxymethyl)furan (7c). A solution of 6c (186.9 g, 0.92 mol) in AcOH (100 mL) was added dropwise over 30 min to a cooled (15 °C) solution of 40% peracetic

### 2,3-Dihydro-5-acyl-2-benzofurancarboxylic Acids

acid (171 g, 0.92 mol) and NaOAc (2.9 g, 0.035 mol). The resultant solution was stirred for 2 h at 15 °C and for 70 h at 25 °C and then poured slowly into 1.75 L of H<sub>2</sub>O containing Na<sub>2</sub>CO<sub>3</sub> (500 g). The resultant mixture was extracted with Et<sub>2</sub>O. The organic extracts were combined, washed with saturated Na<sub>2</sub>CO<sub>3</sub> solution  $(2 \times 100 \text{ mL})$ , H<sub>2</sub>O (100 mL), aqueous FeSO<sub>4</sub> solution (2 × 100 mL), and brine  $(2 \times 100 \text{ mL})$ , dried, and evaporated to give the intermediate 2,3-dichloro-6-(2,3-epoxypropyl)phenol as a brown viscous oil. This oil was heated at 110 °C for 10 min and then distilled to give 142.5 g (71%) of 7c: bp 168-170 °C (0.2 mm); NMR  $\delta$  3.18 (dd, 2, J = 8 and 2 Hz,  $C_3$  H), 3.67–3.90 (m, 2,  $CH_2OH$ , 4.73–5.20 (m, 1, C<sub>2</sub>H), 6.87 (s, 2, Ar H). Anal. (C<sub>9</sub>-H<sub>8</sub>Cl<sub>2</sub>O) C, H.

6,7-Dichloro-2,3-dihydro-2-benzofurancarboxylic Acid (8c). Jones reagent<sup>13</sup> (300 mL) was added dropwise to a stirred, cooled solution of 7c (98.4 g, 0.449 mol) in acetone (1.8 L) at such a rate that the internal temperature did not exceed  $20 \pm 5$  °C. The resultant mixture was stirred for 18 h at 25 °C. Then the insoluble chromium salts were collected by filtration and washed with acetone  $(2 \times 200 \text{ mL})$ . The washings were combined with the filtrate, and the resultant solution was concentrated to 500 mL and poured into  $H_2O$  (2 L). This mixture was extracted with  $Et_2O$  (4 × 300 mL). The organic extracts were combined, washed with brine  $(2 \times 200 \text{ mL})$ , and then extracted with 2 N NaOH (3  $\times$  100 mL). The NaOH extracts were combined and acidified with 12 N HCl to give a solid, which was recrystallized from CHCl<sub>3</sub> (1 L) to provide 52.3 g (50%) of 8c: mp 175-178 °C; NMR  $(Me_2SO-d_6) \delta 3.03-3.97 (m, 2, C_3 H), 5.17-5.53 (m, 1, C_2 H), 7.07$ (s, 2, Ar H). Anal.  $(C_9H_6Cl_2O_3)$  C, H.

Ethyl 6,7-Dichloro-2,3-dihydro-2-benzofurancarboxylate (9c). A solution of 8c (70 g, 0.3 mol) and 96.6% H<sub>2</sub>SO<sub>4</sub> (2 mL) in EtOH (250 mL) was refluxed for 2 h and then evaporated. The resulting residue was suspended in aqueous NaHCO<sub>3</sub> (300 mL) and extracted with  $Et_2O$  (4 × 250 mL). The ethereal extracts were combined, washed with brine  $2 \times 100$  mL), dried, and evaporated. The deposited solid recrystallized from hexane to give 72 g (92%) of 9c: mp 73-75 °C; NMR  $\delta$  1.3 (t, 3, J = 7 Hz, CO<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), 3.47 (dd, 2, J = 8 and 2 Hz, C<sub>3</sub> H), 4.26 (q, 2, J = 7 Hz,  $CO_2CH_2CH_3$ ), 5.26 (dd, 1, J = 9 and 8 Hz,  $C_2$  H), 6.93 (s, 2, Ar H). Anal.  $(C_{11}H_{10}Cl_2O_3)$  C, H.

(±)-6,7-Dichloro-2,3-dihydro-5-(2-thienylcarbonyl)-2benzofurancarboxylic Acid (10c). Anhydrous AlCl<sub>3</sub> (121 g, 0.9 mol) was added over 30 min to a well-stirred solution of 9c (72 g, 0.275 mol) and 2-thiophenecarbonyl chloride (80.8 g, 0.55 mol) in CH<sub>2</sub>Cl<sub>2</sub> (150 mL) which was protected from the atmosphere with a CaCl<sub>2</sub> tube. The resultant reaction mixture was warmed to 95 °C to remove the  $CH_2Cl_2$  and then maintained at 95 °C for an additional 2.5 h. The resulting residue was cooled and partially dissolved in  $CH_2Cl_2$ . This mixture was added to ice (2 kg) and 12 N HCl (125 mL). The resulting mixture was extracted with  $Et_2O$  (4 × 300 mL). The ethereal extracts were combined, washed with brine (3  $\times$  100 mL), dried, and evaporated to give the ethyl ester of 10c as a brown oil. The crude ethyl ester was added to cold 40% NaOH solution (500 mL). The resulting mixture was stirred for 30 min and filtered to collect the sodium salt of 10c. The wet sodium salt was suspended with stirring in 6 N HCl (200 mL) to afford a heterogeneous mixture, which was extracted with  $Et_2O$  (3 × 200 mL). The ethereal extracts were combined, washed with brine  $(3 \times 100 \text{ mL})$ , dried, and evaporated to give a yellow solid, which was recrystallized from CH<sub>3</sub>CN-BuCl to afford 76.2 g (81%) of 10c: mp 194-196 °C; NMR (Me<sub>2</sub>SO-d<sub>6</sub>)  $\delta$  3.3-4.03 (m, 2, C<sub>3</sub> H), 5.57 (dd, 1, J = 10 and 8 Hz, C<sub>2</sub> H), 7.27 (dd, 1, J = 4 and 4 Hz thiophene C<sub>4</sub> H), 7.43-7.67 (m, 3, Ar H and thiophene  $C_5$  H), 8.16 (d, 1, J = 5 Hz, thiophene  $C_3$  H). Anal.  $(C_{14}H_8Cl_2O_4S)$  C, H, Cl.

Compounds 10f-k were prepared in an analogous manner to 10c by substituting the appropriate acid chloride for 2thiophenecarbonyl chloride.

10a was prepared by reacting 9a (prepared by dechlorination of 9c by catalytic hydrogenation with 5% Pd/C as the catalyst) with 2-thiophenecarbonyl chloride under the reaction conditions reported for the synthesis of 10c. 10b was prepared by reacting chloride according to the conditions reported for the synthesis of 10c.

Journal of Medicinal Chemistry, 1981, Vol. 24, No. 7 871

(+)-6,7-Dichloro-2,3-dihydro-5-(2-thienylcarbonyl)-2benzofurancarboxylic Acid (10d). A solution of 10c (73.7 g. 0.214 mol) in CH<sub>3</sub>CN (1000 mL) was mixed with a solution of -)-cinchonidine (63.2 g, 0.214 mol) in 600 mL of boiling EtOH. The resultant solution was concentrated to 1600 mL, diluted with H<sub>2</sub>O (200 mL), and stored at 25 °C for 18 h. The insoluble salt (69.4 g) was collected by filtration and recrystallized (4 times) by dissolving the salt in EtOH (1000 mL) and then adding H<sub>2</sub>O (50 mL) to yield 51.7 g of the salt of the pure (+) enantiomer. The salt was converted to carboxylic acid 10d by treatment with a mixture of ether (1 L) and 6 N HCl (500 mL). The ether layer was separated, washed with brine  $(3 \times 100 \text{ mL})$ , dried, and evaporated to give a tan semisolid. This material was stirred with cold 6 N HCl to give a solid, which was collected by filtration and washed with H<sub>2</sub>O to yield 26.7 g (36%) of 10d:  $[\alpha]^{25}_{436}$  +11.5° (c 1, acetone).

(-)-6,7-Dichloro-2,3-dihydro-5-(2-thienylcarbonyl)-2**benzofurancarboxylic Acid (10e).** d-(+)- $\alpha$ -Methylbenzylamine (13.6 g, 0.112 mol) was added to partially resolved 6,7-dichloro-2,3-dihydro-5-(2-thienylcarbonyl)benzofuran-2-carboxylic acid (38.7 g, 0.112 mol) [obtained from the mother liquor of the resolution of the (+) enantiomer described above], dissolved in  $CH_3CN$  (2 L). The resulting salt (46.2 g) was recrystallized (2 times) from EtOH-CH<sub>3</sub>CN (1:2; v/v;) (1 L) to provide the salt (21.2 g) of the pure (-) enantiomer. The salt was converted to the carboxylic acid in the same manner as described above to give 15.1 g (41%) of 10e: [α]<sup>25</sup>436 -11.5° (c 1, acetone). Methyl 6,7-Dichloro-2,3-dihydro-5-(2-thienylcarbonyl)-2-

benzofurancarboxylate (11a). 10c (3.4 g, 0.01 mol) was dissolved in MeOH (50 mL) containing concentrated  $H_2SO_4$  (0.5 mL). The resulting solution was heated at reflux for 1 h. The CH<sub>3</sub>OH was evaporated to leave a residue, which was suspended in aqueous NaHCO<sub>3</sub> (50 mL) and extracted into  $Et_2O$  (3 × 100 mL). The ethereal extracts were combined, washed with brine  $(2 \times 50 \text{ mL})$ , dried, and evaporated to yield a yellow oil which solidified upon trituration with ether to give 3.0 g (84%) of 11a: mp 110-112 °C; NMR (Me<sub>2</sub>SO-d<sub>6</sub>)  $\delta$  3.3–3.67 (m, 2, C<sub>3</sub> H), 3.75 (s, 3, CO<sub>2</sub>CH<sub>3</sub>), 5.7 (dd, 1, J = 10 and 7 Hz, C<sub>2</sub> H), 7.27 (dd, 1, J = 4 and 4 Hz, thiophene  $C_4$  H), 7.43 (m, 2, Ar H and thiophene  $C_5$  H), 8.17 (dd, 1, J = 5 and 1 Hz, thiophene C<sub>3</sub> H). Anal. (C<sub>15</sub>H<sub>10</sub>Cl<sub>2</sub>O<sub>4</sub>S) C, H.

6,7-Dichloro-5-(2-thienylcarbonyl)-2-benzofurancarboxylic Acid (12). NBS (1.8 g, 0.01 mol) was added to a solution of 11a (3.6 g, 0.01 mol) and benzoyl peroxide (50 mg) in CCl<sub>4</sub> (100 mL). The mixture was refluxed for 1 h and then cooled to 25 °C. The deposited succinimide was removed by filtration and the filtrate was evaporated to give the intermediate brominated compound as a yellow oil (3.8 g). This oil was dissolved in Me<sub>2</sub>SO (25 mL) containing DBN (1.3 g, 0.01 mol). The resulting solution was stirred under an N2 atmosphere for 2 h and then diluted with  $H_2O$  (100 mL) and acidified with 6 N HCl to give 2.7 g (77%) of the methyl ester of 12, which was recrystallized from CH<sub>3</sub>CN: mp 184-187 °C. Anal. (C<sub>15</sub>H<sub>8</sub>Cl<sub>2</sub>O<sub>4</sub>S) C, H.

The methyl ester of 12 (2.7 g, 0.0076 mol) was dissolved in dioxane (50 mL) containing 1 N NaOH (10 mL). The resulting solution was refluxed for 2 h and evaporated to afford a residue, which was suspended in 6 N HCl (50 mL). This mixture was extracted with  $Et_2O$  (3 × 100 mL). The ethereal extracts were combined, washed with brine  $(3 \times 50 \text{ mL})$ , dried, and evaporated to give a solid, which was recrystallized from CH<sub>3</sub>CN. Thereby was obtained 2.2 g (85%) of 12: mp 244-245 °C; NMR (Me<sub>2</sub>SO-d<sub>6</sub>)  $\delta$  7.23 (dd, 1, J = 4 and 4 Hz, thiophene C<sub>4</sub> H), 7.53 (dd, 1, J = 4 and 1 Hz thiophene C<sub>5</sub> H), 7.77 (s, 1, Ar H), 8.0 (s, 1 C<sub>2</sub> H), 8.17 (dd, 1, J = 4 and 1 Hz, thiophene C<sub>3</sub> H). Anal. (C<sub>14</sub>H<sub>6</sub>Cl<sub>2</sub>O<sub>4</sub>S) C, H.

6,7-Dichloro-2,3-dihydro-5-(2-thienylmethyl)-2-benzofurancarboxylic Acid (13). Zinc amalgam (60 g) was added to a well-stirred mixture of 10c (9.2 g, 0.027 mol), toluene (50 mL), and 12 N HCl (35 mL). After 6 h at reflux, additional 12 N HCl (10 mL) was added and refluxing was continued for 24 h. The

organic layer was separated, diluted with Et<sub>2</sub>O (100 mL), washed with brine (3 × 50 mL), dried, and evaporated to give 5.3 g of a yellow solid. The solid was chromatographed on silica gel (250 g). Elution with benzene-dioxane-acetic acid (25:5:1, v/v) gave 1.8 g (20%) of 13: mp 170-171 °C; NMR (Me<sub>2</sub>SO- $d_{e}$ )  $\delta$  3.07-4.00 (m, 2, C<sub>3</sub> H), 4.23 (s, 2, Ar CH<sub>2</sub>), 5.43 (dd, 1, J = 10 and 7 Hz, C<sub>2</sub> H), 6.87-7.10 (m, 2, Ar H and thiophene C<sub>4</sub> H), 7.23-7.43 (m, 2, thiophene C<sub>3</sub> and C<sub>5</sub> H). Anal. (C<sub>14</sub>H<sub>10</sub>Cl<sub>2</sub>O<sub>3</sub>S) C, H.

**6,7-Dichloro-2,3-dihydro-5-(hydroxy-2-thienylmethyl)-2benzofurancarboxylic** Acid (14). KBH<sub>4</sub> (0.8 g, 0.015 mol) was added slowly to a stirred mixture of **10c** (3.4 g, 0.01 mol) and H<sub>2</sub>O (20 mL) cooled in an ice bath. After the addition was completed, the solution was stirred for 2 h at 25 °C and then acidified with 6 N HCl to give a yellow gum. The gum was triturated with 6 N HCl to provide a solid, which was washed with H<sub>2</sub>O to yield 1.8 g (52%) of 14: mp 175 °C dec; NMR (Me<sub>2</sub>SO-d<sub>6</sub>)  $\delta$  3.27–3.70 (m, 2, C<sub>3</sub> H), 5.33 (dd, 1, J = 10 and 7 Hz, C<sub>2</sub> H), 6.13 (s, 1, Ar CH), 6.70–7.00 (m, 2, Ar H, thiophene C<sub>4</sub> H), 7.17–7.60 (m, 2, thiophene C<sub>3</sub> and C<sub>5</sub> H). Anal. (C<sub>14</sub>H<sub>10</sub>Cl<sub>2</sub>O<sub>4</sub>S) C, H.

6,7-Dichloro-2,3-dihydro-2-(hydroxymethyl)-5-(2-thienylcarbonyl)benzofuran (15). Borane-tetrahydrofuran complex (25 mL, 0.00625 mol) was added dropwise to a stirred solution of 10c (3.4 g, 0.01 mol) in THF (50 mL) cooled to 0 °C. The reaction solution was stirred for 1 h at 0 °C and for 18 h at 25 °C and then diluted with saturated aqueous NaHCO<sub>3</sub> (50 mL). The aqueous layer was separated and extracted with Et<sub>2</sub>O (2 × 25 mL). The organic extracts were combined, washed with brine, dried, and evaporated to give a yellow oil. The oil was chromatographed on silica gel (150 g). Elution with benzene-MeOH (19:1, v/v) gave 0.7 g (21%) of 15: mp 65-68 °C; NMR (Me<sub>2</sub>SO-d<sub>6</sub>)  $\delta$ 3.17-3.50 (m, 2, C<sub>3</sub> H), 3.70-3.90 (m, 2, CH<sub>2</sub>OH), 4.90-5.43 (m, 1, C<sub>2</sub> H), 7.17-7.47 (m, 2, Ar H, thiophene C<sub>4</sub> H), 7.55 (dd, 1, J = 4 and 1 Hz, thiophene C<sub>5</sub> H), 8.10 (dd, 1, J = 4 and 1 Hz, thiophene C<sub>3</sub> H). Anal. (C<sub>14</sub>H<sub>10</sub>Cl<sub>2</sub>O<sub>3</sub>S) C, H.

6,7-Dichloro-2,3-dihydro-5-(2-thienylcarbonyl)-2-benzofurancarboxaldehyde (16). A solution of Red-Al (1.5 g, 10.7 mmol) in THF (10 mL) was added dropwise over 15 min to a stirred solution of the ester (3.57 g, 10 mmol) 11a in THF (50 mL) cooled to -70 °C. After the solution stirred for 1 h at -70 °C, 24%  $H_2SO_4$  (10 mL) was added dropwise and the mixture was allowed to warm to 25 °C. The organic layer was separated and the aqueous layer was extracted with THF  $(2 \times 10 \text{ mL})$ . The organic layers were combined, diluted with  $Et_2O$  (50 mL), washed with brine  $(3 \times 25 \text{ mL})$ , dried, and evaporated to give a yellow oil. A solution of the oil in n-BuCl (50 mL) was added to a solution of  $NaHSO_3$  (6 g, 57.5 mmol) in H<sub>2</sub>O (10 mL), and the resultant mixture was stirred for 18 h. The bisulfite addition product was removed by filtration and converted to the aldehyde by treatment with a mixture of  $Et_2O$  (50 mL) and aqueous NaHCO<sub>3</sub> (25 mL). The organic layer was separated, washed with brine  $(2 \times 10 \text{ mL})$ , dried, and evaporated to give a mixture of 13 and hydrated 13. The water was removed by refluxing the mixture for 2 h in benzene and collecting the azeotrope in a Dean-Stark apparatus. The dried solution was evaporated to give a residue, which was triturated with petroleum ether to afford 1.0 g (31%) of 16: mp 162–164 °C; NMR (Me<sub>2</sub>SO- $d_6$ )  $\delta$  3.23–3.73 (m, 2, C<sub>3</sub> H), 5.57 (dd, 1, J = 10 and 7 Hz,  $C_2$  H), 7.13 (dd, 1, J = 4 and 4 Hz, thiophene  $C_4$ H), 7.3–7.53 (m, 2, Ar H, thiophene  $C_5$  H), 8.07 (dd, 1, J = 4 and 1 Hz), 9.75 (s, 1, CHO). Anal. (C14H8Cl2O3S) C, H.

Ethyl 6,7-Dichloro-2,3-dihydro-5-(2-thienylcarbonyl)-2benzofurancarboxylate (11b). A solution of acid 10c (1.0 g, 2.9 mmol) in EtOH (10 mL) containing concentrated H<sub>2</sub>SO<sub>4</sub> (0.1 mL) was refluxed for 1 h. Removal of solvent afforded a residue, which was suspended in aqueous NaHCO<sub>3</sub> solution (50 mL) and extracted with Et<sub>2</sub>O ( $3 \times 25$  mL). The organic extracts were combined, washed with brine ( $2 \times 25$  mL), dried, and evaporated. The resulting solid was recrystallized from EtOH-H<sub>2</sub>O to give 0.7 g (65%) of 11b: mp 64-66 °C; NMR  $\delta$  1.3 (t, 3, J = 7 Hz, COOCH<sub>2</sub>CH<sub>3</sub>), 3.37-3.83 (m, 2, C<sub>3</sub> H), 4.27 (q, 2, J = 7 Hz, COOCH<sub>2</sub>CH<sub>3</sub>), 5.33 (dd, 1, J = 9 and 7 Hz, C<sub>2</sub> H), 6.77-7.20 (m, 2, Ar H and thiophene C<sub>4</sub> H), 7.33 (dd, 1, J = 4 and 1 Hz, thiophene C<sub>5</sub> H), 7.67 (dd, 1, J = 4 and 1 Hz, thiophene C<sub>3</sub> H). Anal. (C<sub>16</sub>H<sub>12</sub>Cl<sub>2</sub>O<sub>4</sub>S) C, H.

**6,7-Dichloro-2,3-dihydro-5-(2-thienylcarbonyl)-2-benzofurancarboxylic Acid Hydrazide (17).** Hydrazine (0.35 g, 11 mmol) was added to a stirred solution of the ester 11b (3.7 g, 10 mmol) in EtOH (50 mL). After 2 h, the solid which separated from the reaction was collected and recrystallized from DMF-H<sub>2</sub>O to give 1.9 g (53%) of 17: mp 220-222 °C eff; NMR (Me<sub>2</sub>SO-d<sub>6</sub>)  $\delta$  3.30-3.67 (m, 2, C<sub>3</sub> H), 4.45 (br s, 2, CNHNH<sub>2</sub>), 5.37 (dd, 1, J = 9 and 7 Hz, C<sub>2</sub> H), 7.23 (dd, 1, J = 4 and 4 Hz, thiophene C<sub>4</sub> H), 7.33-7.60 (m, 2, Ar H, thiophene C<sub>5</sub> H), 8.13 (dd, 1, J = 4 and 1 Hz, thiophene C<sub>3</sub> H), 9.57 (br, s, 1, CNHNH<sub>2</sub>). Anal. (C<sub>14</sub>-H<sub>10</sub>Cl<sub>2</sub>N<sub>2</sub>O<sub>3</sub>S) C, H, N.

N-(Aminoiminomethyl)-6,7-dichloro-2,3-dihydro-5-(2thienylcarbonyl)-2-benzofurancarboxamide (18). A solution of ester 11b (3.7 g, 10 mmol) in EtOH (50 mL) was added to a stirred mixture of guanidine hydrochloride (0.95 g, 10 mmol) and NaOMe (0.54 g, 10 mmol) in EtOH (25 mL). The resulting mixture was stirred for 2 h at 25 °C and then evaporated to give a beige foam, which was chromatographed on silica gel (250 g). Elution with THF-3 N NH<sub>4</sub>OH 95:5, v/v, 180 mL) provided an impure material which was discarded. Continued elution with the same eluant (350 mL) gave a slightly impure solid, which was converted to its HCl salt by treatment with 6 N HCl (20 mL). The insoluble solid was collected and washed with H<sub>2</sub>O to give 0.8 g (20%) of 18: mp 240-241 °C; NMR (Me<sub>2</sub>SO- $d_6$ )  $\delta$  3.33-3.93 (m, 2, C<sub>3</sub> H), 5.70 (dd, 1, J = 9 and 7 Hz, C<sub>2</sub> H), 7.23 (dd, 1, J= 4 and 4 Hz, thiophene  $C_4$  H), 7.33-7.60 (m, 2, Ar H and thiophene C<sub>5</sub> H), 8.13 (d, 1, J = 4 Hz, thiophene C<sub>4</sub> H), 8.57 [br s, 4,  $CONH^{--}(NH_2)_2^+$ ], 12.20 [br s, 1,  $CONH^{--}(NH_2)_2^+$ ]. Anal. (C<sub>15</sub>H<sub>11</sub>Cl<sub>2</sub>N<sub>3</sub>O<sub>3</sub>S·HCl) C, H; N: calcd, 9.99; found, 9.43.

6,7-Dichloro-2,3-dihydro-5-(2-thienylcarbonyl)-2-benzofurancarboxamide (19). A solution of 10c (3.4 g, 10 mmol) and SOCl<sub>2</sub> (2 mL) in benzene (25 mL) was refluxed for 2 h. The solvent and excess SOCl<sub>2</sub> were removed by evaporation to give the intermediate carbonyl chloride (3.6 g) as an oil. Addition of this oil to concentrated NH<sub>4</sub>OH (50 mL) gave a mixture, which was heated at 95 °C for 30 min. The deposited solid was collected and recrystallized from CH<sub>3</sub>CN to provide 2.45 g (72%) of 19: mp 248-250 °C; NMR (Me<sub>2</sub>SO-d<sub>6</sub>)  $\delta$  3.07-3.67 (m, 2, C<sub>3</sub> H), 5.33 (dd, 1, J = 10 and 7 Hz, C<sub>2</sub> H), 7.16 (dd, 1, J = 4 and 4 Hz, thiophene C<sub>4</sub> H), 7.27-7.67 (m, 2, Ar H, thiophene C<sub>5</sub> H), 8.07 (dd, 1, J = 4 and 1 Hz, thiophene C<sub>3</sub> H). Anal. (C<sub>14</sub>H<sub>9</sub>Cl<sub>2</sub>NO<sub>3</sub>S) C, H, N.

6,7-Dichloro-2,3-dihydro-5-(2-thienylcarbonyl)-2-benzofurancarbonitrile (20). A mixture of 19 (2.5 g, 7.3 mmol) and POCl<sub>3</sub> (20 mL) at 0 °C was treated with Et<sub>3</sub>N (1.5 g, 14.6 mmol). The resulting mixture was heated at 95 °C for 1 h, after which the excess POCl<sub>3</sub> was removed at reduced pressure. The residue was treated with ice and H<sub>2</sub>O and extracted with CHCl<sub>3</sub> (3 × 100 mL). The organic extracts were combined, washed with NaHCO<sub>3</sub> solution (2 × 50 mL) and brine (50 mL), dried, and evaporated to give a yellow solid. The yellow solid was recrystallized from *i*-PrOH-H<sub>2</sub>O and then from MeOH-H<sub>2</sub>O to give 1.4 g (59%) of 20: mp 188-190 °C; NMR (Me<sub>2</sub>SO-d<sub>6</sub>)  $\delta$  3.62-3.88 (m, 2, C<sub>3</sub> H), 6.05 (dd, 1, J = 9 and 7 Hz, C<sub>2</sub> H), 7.18 (dd, 1, J = 4 and 4 Hz, thiophene C<sub>4</sub> H), 7.41-7.58 (m, 2, Ar H, thiophene C<sub>5</sub> H), 8.11 (dd, 1, J = 4 and 1 Hz, thiophene C<sub>3</sub> H). Anal. (C<sub>14</sub>H<sub>7</sub>Cl<sub>2</sub>NO<sub>2</sub>S) C, H, N.

5-[6,7-Dichloro-2,3-dihydro-5-(2-thienylcarbonyl)-2benzofuranyl]-1H-tetrazole (21). A solution of nitrile 20 (0.46 g, 1.4 mmol), NaN<sub>3</sub> (0.10 g, 1.6 mmol), and NH<sub>4</sub>Cl (0.086 g, 1.6 mmol) in DMF (30 mL) was stirred at 100 °C for 70 h. The DMF was evaporated to afford a residue, which was dissolved in aqueous NaHCO<sub>3</sub> (20 mL) and extracted with ether (2  $\times$  10 mL). The aqueous layer was acidified with 6 N HCl and extracted with Et<sub>2</sub>O  $(3 \times 20 \text{ mL})$ . The extracts were combined, washed with brine  $(3 \times 20 \text{ mL})$ , dried, and evaporated to give a yellow solid. The solid was purified by dissolution in aqueous NaHCO<sub>3</sub> and acidification of the alkaline solution with 6 N HCl to give, after filtration, 0.25 g (48%) of 21: mp 108-115 °C; NMR & 3.80 (br d, 2, J = 9 Hz, C<sub>3</sub> H), 6.32 (br t, 1, J = 9 Hz, C<sub>2</sub> H), 6.90–7.20 (m, 2, Ar H, thiophene C<sub>4</sub> H), 7.37 (dd, 1, J = 4 and 1 Hz, thiophene  $C_5$  H), 7.68 (dd, 1, J = 4 and 1 Hz, thiophene  $C_3$  H). Anal. (C<sub>14</sub>H<sub>8</sub>Cl<sub>2</sub>N<sub>4</sub>O<sub>2</sub>S) C, H; N: calcd, 15.26; found, 15.79.

6,7-Dichloro-2,3-dihydro-5-(2-thienylsulfonyl)-2-benzofurancarboxylic Acid (22). Anhydrous  $AlCl_3$  (2.6 g, 20 mmol) was added over 5 min to a well-stirred mixture of ester 9 (5.2 g, 20 mmol) and 2-thiophenesulfonyl chloride (3.6 g, 20 mmol) protected from the atmosphere with a CaCl<sub>2</sub> drying tube. The reaction mixture was stirred at 25 °C for 18 h and at 90 °C for

## 2,3-Dihydro-5-acyl-2-benzofurancarboxylic Acids

1 h and then poured into ice-water (150 mL) and 12 N HCl (15 mL). The resulting mixture was extracted with  $Et_2O$  (3 × 250 mL). The ethereal extracts were combined, washed with brine  $(3 \times 100 \text{ mL})$ , dried, and evaporated to give the crude esterified product (7.8 g) as a tan oil. The tan oil was hydrolyzed by dissolution in 10% NaOH (100 mL). The solution was acidified with 12 N HCl to give a tan oil (5.8 g), which was chromatographed on silica gel (700 g). Elution with benzene-dioxane-AcOH (25:5:1, v/v, 1350 mL) provided a forerun which was discarded. Continued elution with the same eluant (1785 mL) gave a slightly impure product which was purified by precipitation from 2 N NaOH with 6 N HCl to give 1.2 g (15%) of 22: mp 189-193 °C; NMR  $(Me_2SO-d_6) \delta 3.30-3.83 (m, 2, C_3 H), 5.57 (dd, 1, J = 10 and 7)$ Hz,  $C_2$  H), 7.20 (dd, 1, J = 4 and 4 Hz, thiophene  $C_4$  H), 7.87 (dd, 1, J = 4 and 1 Hz, thiophene C<sub>5</sub> H), 8.00–8.20 (m, 2, Ar H and thiophene C<sub>4</sub> H). Anal.  $(C_{13}H_8Cl_2O_5S\cdot 0.5H_2O)$  C, H.

**X-ray of Crystal Structure.** Crystals of 10e ( $C_{14}H_8Cl_2O_4S$ ) suitable for X-ray analysis crystallized with space group symmetry  $P2_12_12_1$  from toluene. Cell constants determined through initial experiments were a = 6.994 (1) Å, b = 17.237 (2) Å, and c = 23.400 (3) Å with Z = 8 for a calculated density of 1.62 g/cm<sup>3</sup>. Of the 2214 unique reflections measured with graphite monochromated Cu K $\alpha$  radiation ( $\lambda = 1.5418$  Å), 1677 (76%) were observed ( $I \ge 3\sigma I$ ). The crystal structure was solved using a standard multisolution method<sup>15</sup> and Fourier difference calculations.<sup>16</sup> The

structure was refined using full matrix least-squares techniques by minimizing  $\sum w(|F_o| - |F_c|)^2$  with  $w = (1/\sigma F_o)^2$ . At the end of anisotropic refinement for the nonhydrogen atoms and utilizing anomalous scattering factors for S and Cl, the *R* factor was 0.085 for one enantiomer and 0.090 for the other. This difference, which is significant at the 99.5% level,<sup>17</sup> was confirmed by careful remeasurement of 15 enantiomorphic sensitive reflections. The final residual index obtained after adding hydrogens with fixed isotropic temperature parameters was 0.075. The correct absolute configuration for 10e is shown in the computer-generated drawing in Figure 1.<sup>18</sup> Tables VI, VII, and VIII (containing fractional coordinates and temperature parameters, bond distances, and bond angles) are located in the supplementary material.

Acknowledgment. The authors are indebted to C. Ziegler for the synthesis of 10i, to Dr. W. C. Randall and staff for the elemental analysis, to Dr. B. Arison and W. R. McGaughran for NMR spectra, and to Drs. R. Hirschmann and C. A. Stone for their guidance and advice throughout the course of this investigation.

Supplementary Material Available: Fractional coordinates and temperature parameters, bond distances, and bond angles for 10e (5 pages). Ordering information is given on any current masthead page.
