

41. Synthesis of (–)-Conduritol C (1L-Cyclohex-5-ene-1,2,3/4-tetrol)¹⁾

by Claude Le Drian, Eric Vieira²⁾, and Pierre Vogel*

Institut de chimie organique de l'Université, 2, rue de la Barre, CH-1005 Lausanne

(21. XII. 88)

(1*R*,2*R*,4*R*)-2-*endo*-Cyano-7-oxabicyclo[2.2.1]hept-5-en-2-yl acetate ((–)-7) has been transformed into the all-*cis*-configured 4*L*-4,5,6/0-trihydroxycyclohex-2-en-1-one derivatives (–)-12 and (–)-19. (–)-Conduritol C ((–)-3) was derived in a stereospecific manner from (–)-12.

Introduction. – Among the six possible structures of the conduritols (cyclohexenetetrols), conduritols A (1) and D (4) are *meso* and conduritols B (2), C (3), E (5), and F (6) exist as pairs of enantiomers [3]. From the bark of *Marsdenia Condurango*, 1 was isolated already in 1908 by Kubler [4]. In 1962, Plouvier [5] isolated 'leucanthemitol' (= (+)-conduritol F) from *Chrysanthemum leucanthemum*. This compound was then discovered in many other plants [6] [7]. The syntheses of *meso* 1 and 4 and of racemic 2, 3, 5, and 6 have been reported [3] [8–13]³⁾. In 1958, Angyal *et al.* [14] presented a synthesis of (+)-conduritol E (= 1*D*-cyclohex-5-ene-1,2/3,4-tetrol; (+)-5). In 1981, Paulsen *et al.* [15] reported the syntheses of (–)-conduritol B (= 1*L*-cyclohex-5-ene-1,3/2,4-tetrol; (–)-2) and (–)-conduritol F (= 1*L*-cyclohex-5-ene-1,2,4/3-tetrol; (–)-6)⁴⁾.

The biosynthesis of natural conduritols has been studied [6]. Interestingly, their derivatives (*e.g.* epoxycyclohexanetetrols [8] [18], epoxycyclohexenediols [19] [20], aminoconduritols [21], and bromoconduritols [19] [22]) have biological activities (*e.g.* glycosidase inhibitors). This should stimulate the development of new syntheses of optically pure conduritols. Whereas racemic conduritol C ((±)-3) has been derived from *epi*-inositol [23] and from cyclohexa-3,5-diene-1,2-diol [24], we report here the first total synthesis of optically pure (–)-conduritol C ((–)-3).

¹⁾ Enantiomerically pure 7-oxabicyclo[2.2.1]hept-5-en-2-yl derivatives ('naked sugars' [1]) as synthetic intermediates, Part VI; Part V: [2].

²⁾ Present address: Ciba-Geigy SA, Marly, CH-1700 Fribourg.

³⁾ For recent syntheses, see conduritol A [8], (±)-conduritol B [9] [10], (±)-tetra-*O*-benzylconduritol B [11], (±)-1,2-di-*O*-benzoyl-4-*O*-methylconduritol F [12], and (±)-anhydroconduritols [13].

⁴⁾ For the determination of the absolute configuration of the cyclohexanetetrols, see [16] [17].

Results and Discussion. – Our starting material is the ‘naked sugar’ (–)-**7** ((–)-(1*R*,2*R*,4*R*)-2-*endo*-cyano-7-oxabicyclo[2.2.1]hept-5-en-2-*exo*-yl acetate, ee > 99%) [25]. Stereospecific *cis*-bis-hydroxylation of (–)-**7** with H₂O₂ in *t*-BuOH and a catalytical amount of OsO₄ gave diol (–)-**8** which was silylated with (*t*-Bu)Me₂SiCl and imidazole in DMF [26] to (–)-**9** (74% based on (–)-**7**). Saponification of (–)-**9** in the presence of formaline yielded ketone (+)-**10** (80%)

^{a)} Only one enantiomer is represented.

Strong bases such as NaOMe or LiN(SiMe₃)₂ which are used to isomerize 7-oxabicyclo[2.2.1]heptane-2-carboxylates or 7-oxabicyclo[2.2.1]hept-2-yl alkyl ketones into the corresponding 1-substituted 5-hydroxycyclohex-1-enes [27] induced quick decomposition of (+)-**10**. With Et₃N, the ring opening of the O-bridge occurred, only if trimethylsilyl triflate (TfOSiMe₃) was added to the reaction mixture and led to the formation of **11**. The latter was readily hydrolyzed with MeOH/H₂O/HF to afford crystalline (–)-**12** (87% based on (+)-**10**). Treatment of the acetone (±)-**13** [28] with Et₃N/TfOSiMe₃ in PhH (0°) for 105 min gave a 1:1.4:1 mixture (±)-**13**/(±)-**14**/(±)-**15**. After prolonged reaction time or using a large excess of Et₃N/TfOSiMe₃, the unstable cyclohexadiene derivative (±)-**15** was the major product. Acidic hydrolysis (MeOH/H₂O/HCl, 20°) of (±)-**14** gave hydroxyketone (±)-**16** (71%).

Reduction of (±)-**16** with NaBH₄/CeCl₃ in MeOH [29] afforded the partially protected conduritol D derivative (±)-**17** (73%) which, on acidic hydrolysis, gave conduritol D (**4**) quantitatively. Reduction of (±)-**11** with diisobutylaluminium hydride (DIBALH) in THF afforded (±)-**18** in excellent yield. All our attempts to displace the unprotected alcohol in (±)-**18** using the *Mitsunobu* method [30] failed.

The acetate (–)-**19** (95%) was, thus, prepared by treating (–)-**12** with Ac₂O/pyridine and 4-(dimethylamino)pyridine. Reduction of (–)-**19** with NaBH₄ and CeCl₃ in MeOH

afforded (–)-**20** (92%) which was converted readily into the benzoate (–)-**21** (87%) on treatment with diethyl azodicarboxylate, Ph_3P , and benzoic acid in THF. (–)-Conduritol C ((–)-**3**) was obtained in 71% yield, after removal of the protective groups in (–)-**21**. Acetylation (Ac_2O /pyridine) of (–)-**3** gave tetraacetate (–)-**22** and hydrogenation of (–)-**3** (H_2 , Pd/C, MeOH) the (–)-1L-cyclohexane-1,2,3/4-tetrol ((–)-**23**) whose characteristics (see *Exper. Part*) were similar to those reported by *Posternak et al.* [31] [32] for this compound. Thus, our total synthesis confirms the absolute configuration (1L) attributed in 1955 [16] to (–)-**23**.

(±)-**24** R = (*t*-Bu) Me_2Si^a)

(±)-**25** R = (*t*-Bu) Me_2Si^a)

^a) Only one enantiomer is represented.

The *Mitsunobu* displacement reaction has been shown to be a $\text{S}_{\text{N}}2$ process which does not involve allylic rearrangement with allylic alcohols [33]. We have demonstrated that this applies also to reaction (–)-**20** → (–)-**21** in the following manner. Reduction of (±)-**19** with $\text{NaBD}_4/\text{CeCl}_3$ in MeOH gave the deuterated conduritol-D derivative (±)-**24** which, on treatment with Ph_3P , diethyl azodicarboxylate, and benzoic acid gave exclusively (±)-**25**, with no deuterium incorporation in the olefinic moiety.

Another, lower-yield and less selective synthesis of conduritol C was realized in the following way. Deprotection (Bu_4NF /THF) of (±)-**12** followed by acetylation (Ac_2O /pyridine) gave the triacetate (±)-**26**. Its reduction⁵⁾ with $\text{NaBH}_4/\text{CeCl}_3$ in MeOH/ H_2O at 0° led, after acetylation, to a mixture of **28** and (±)-**22**, isolated in 51 and 35% yield, respectively⁶⁾.

Conclusion. – The ‘naked sugar’ (–)-**7** has been converted into (–)-conduritol C ((–)-**3**) in 28% overall yield. Chiral derivatives of conduritol D (**4**) were also obtained readily. A very smooth technique for the isomerization of 7-oxabicyclo[2.2.1]heptan-2-ones into the corresponding 6-hydroxycyclohex-2-en-1-ones⁷⁾ has been developed.

We thank the *Swiss National Science Foundation*, the *Fonds Herbette*, Lausanne, *F. Hoffmann-La Roche & Co. AG*, Basel, and *Du Pont de Nemours & Co.*, Wilmington, for financial support.

⁵⁾ Reduction of (±)-**12**, (±)-**14**, (±)-**16**, and (±)-**19** by several reducing agents (NaBH_4 , $\text{NaBH}_4/\text{CeCl}_3$, LiAlH_4 , DIBAH) gave only all-*cis*-conduritol-D derivatives, with no significant amount of conduritol-C derivatives. Reduction of the trihydroxyketone (±)-**27** by NaBH_4 yielded a *ca.* 1:1 mixture of conduritols C and D.

⁶⁾ Protected 4L-4,5,6/0-trihydroxycyclohex-2-en-1-ones such as **11** are intermediates [34] in the synthesis of COTC ((4*R*,5*R*,6*R*)-2-[(crotonyloxy)methyl]-4,5,6-trihydroxycyclohex-2-en-1-one) [35], a glyoxalase inhibitor with potential cytotoxic and anticancer activity [36].

⁷⁾ Enone (–)-**12** has been transformed [37] into the aglycone of a ‘cyanoglucoside’ [(1*Z*,4*R*,5*R*,6*S*)-6-(β-D-glucosyloxy)-4,5-dihydroxycyclohex-2-ene-1-ylidene]acetone nitrile isolated from *Ilex Warburgii* [38].

Experimental Part

General. See [28].

(-)-(1R,2R,4R,5S,6R)-2-endo-Cyano-5-exo,6-exo-dihydroxy-7-oxabicyclo[2.2.1]hept-2-exo-yl Acetate ((-)-8). To a soln. of (-)-7 [25] (5.1 g, 28.5 mmol; $[\alpha]_{589}^{25} = +57.7$, $c > 99\%$) in 50 ml of *t*-BuOH, OsO₄ (4% soln. in CCl₄; 1 ml, 0.2 mmol) and H₂O₂ (30% soln. in H₂O; 15 ml, 0.15 mol) were successively added. This black mixture was left at 25° until it was decolorized (3 weeks). Sufficient NaHSO₃ (40% soln. in H₂O; ca. 30 ml, ca. 0.15 mol) was then added under vigorous stirring at 0° to reduce peroxides. The mixture was then poured into sat. aq. NaCl soln. (100 ml) and extracted with AcOEt (200 ml, 7 times). The combined org. phases were washed with sat. aq. NaCl soln. (20 ml), dried (MgSO₄), and evaporated. The residue was dissolved in hot CHCl₃ (100 ml), dried (MgSO₄), and left overnight at -30°. Pure (-)-8 crystallized out (3.55 g, 58.4%; m.p. 117–119°); the residue (2.3 g) left by evaporation of the mother-liquors was dissolved in DMF (12 ml) and treated successively by imidazole (2 g, 29 mmol) and (*t*-Bu)Me₂SiCl (4.3 g, 28 mmol). After 8 h at 25°, imidazole (1 g, 14 mmol) and (*t*-Bu)Me₂SiCl (2.1 g, 14 mmol) were added and the mixture left for 15 h. Extraction and chromatography (*vide infra*) yielded 2.7 g (21.5% from (-)-7) of (-)-9 as a clear oil. Data of (-)-8: Recrystallization from CHCl₃ gave an anal. sample. M.p. 119–121°. $[\alpha]_{589}^{25} = -42$, $[\alpha]_{578}^{25} = -44$, $[\alpha]_{546}^{25} = -50$, $[\alpha]_{436}^{25} = -86$, $[\alpha]_{365}^{25} = -136$ ($c = 1$, CHCl₃). IR (KBr): 3430, 3350, 2970, 2240, 1745, 1445, 1370, 1225, 1195, 1110, 1045, 1010, 920, 875. ¹H-NMR (360 MHz, CDCl₃): 4.68 (br. *d*, ⁴*J* = 1.5, H-C(1)); 4.54 (*m*, H-C(4)); 4.50, 4.03 (2*d*, ³*J* = 6, H-C(5), H-C(6)); 2.26 (*m*, 2 H-C(3)); 2.15 (*s*, CH₃COO). ¹³C-NMR (62.9 MHz, CDCl₃): 169.1 (*s*, CO); 116.2 (*s*, CN); 86.9 (*dm*, ¹*J*(C,H) = 172); 81.7 (*dm*, ¹*J*(C,H) = 169); 73.0 (*dm*, ¹*J*(C,H) = 165); 72.2 (*s*, C(2)); 69.9 (*d*, ¹*J*(C,H) = 153); 41.4 (*t*, ¹*J*(C,H) = 138, C(3)); 20.8 (*q*, ¹*J*(C,H) = 129, CH₃CO). (-)-(1R,2R,4R,5R,6S)-5-exo,6-exo-Bis{[(*tert*-butyl)dimethylsilyl]oxy}-2-endo-cyano-7-oxabicyclo[2.2.1]hept-2-exo-yl Acetate ((-)-9). To a soln. of (-)-8 (3.3 g, 15.5 mmol) in dry DMF (18 ml), imidazole (3 g, 44 mmol) and (*t*-Bu)Me₂SiCl (6.5 g, 43 mmol) were successively added. After stirring at 25° for 8 h, imidazole (1.5 g, 22 mmol) and (*t*-Bu)Me₂SiCl (3.2 g, 21 mmol) were added. After 15 h at 25°, the mixture was poured in Et₂O (250 ml) and washed successively with sat. aq. NaCl soln. (30 ml), 2*M* aq. HCl (50 ml), 10% aq. K₂CO₃ soln. (50 ml), and sat. aq. NaCl soln. (20 ml). The aq. layers were extracted successively with Et₂O (120 ml). The combined org. phases were dried (MgSO₄), evaporated, vacuum-dried (40°/0.03 Torr), and purified by column chromatography on silica gel (Lobar, size C, Et₂O/petroleum ether 1:6) yielding 6.15 g (90%) of a clear oil. All recrystallization attempts were unsuccessful. $[\alpha]_{589}^{25} = -20.6$, $[\alpha]_{578}^{25} = -21.4$, $[\alpha]_{546}^{25} = -24.4$, $[\alpha]_{436}^{25} = -41.5$, $[\alpha]_{365}^{25} = -65$ ($c = 11$, CHCl₃). MS (70 eV): 372 (1, M^+), 357 (1), 316 (9), 315 (34), 299 (10), 287 (4), 225 (6), 199 (6), 198 (35), 183 (58), 155 (32), 147 (28), 73 (100). Anal. calc. for $\text{C}_{18}\text{H}_{36}\text{O}_4\text{Si}_2$ (372.65): C 58.02, H 9.74; found: C 57.99, H 9.78.

(4R,5S,6R)-4,5-Bis[*isopropylidenedioxy*]-6-[*trimethylsilyl*]oxy]cyclohex-2-en-1-one ((±)-**14**). To a stirred soln. of (±)-**13** [28a] (7.36 g, 40 mmol) and Et_3N (12.4 ml, 9 g, 88 mmol) in anhyd. PhH (100 ml) at 0°, a soln. of TiOSiMe_3 (14.5 ml, 17.8 g, 80 mmol) in anhyd. PhH (80 ml) was added dropwise within ca. 15 min. After stirring at 0° for 135 min, the mixture was poured portionwise into a vigorously stirred mixture of sat. aq. NaHCO_3 soln. (100 ml), sat. aq. NaCl soln. (50 ml), ice (200 g), and CH_2Cl_2 (200 ml). The aq. layer was extracted with CH_2Cl_2 (100 ml, twice). The org. phases were dried (MgSO_4) and evaporated giving (±)-**13**/(±)-**14**/(±)-**15** 1:1.4:1 ($^1\text{H-NMR}$ (360 MHz, CDCl_3)). Chromatography on a column of silica gel at -20° ($\text{AcOEt}/\text{CHCl}_3$ 1:9) afforded first 2.8 g (21%) of impure (±)-**15**, then 3.9 g of crude (±)-**14**, and finally 2.2 g (30%) of (±)-**13**. The 2nd fraction was recrystallized from hexane yielding 3.65 g (36%) of (±)-**14** as white crystals. M.p. 115–117°. UV (dioxane): 331 (34), 214 (7100). IR (CCl_4): 3000, 2960, 2940, 2900, 1717, 1385, 1375, 1250, 1170, 1095, 1050. $^1\text{H-NMR}$ (360 MHz, CDCl_3): 6.59 (dt, $^3J = 10$, $^2, ^4J = 2$, H-C(3)); 6.05 (dd, $^3J = 10$, $^4J = 1$, H-C(2)); 4.95–4.65 (m, H-C(4), H-C(5)); 4.48 (d, $^3J = 3$, H-C(6)); 1.40, 1.35 (2s, Me_2C); 0.20 (s, Me_3Si). $^{13}\text{C-NMR}$ (15.08 MHz, CDCl_3): 194.8 (s, C(1)); 143.7 (d, $^1J(\text{C},\text{H}) = 166$, C(3)); 127.1 (d, $^1J(\text{C},\text{H}) = 168$, C(2)); 111.3 (s, Me_2C); 79.4 (d, $^1J(\text{C},\text{H}) = 154$); 73.8, 73.3 (2d, $^1J(\text{C},\text{H}) = 140$); 27.5, 26.6 (2q, $^1J(\text{C},\text{H}) = 126$, (CH_3) $_2\text{C}$); 0.2 (q, $^1J(\text{C},\text{H}) = 120$, (CH_3) $_3\text{Si}$). CI-MS (CH_4): 257 (5, $[M + 1]^+$), 242 (10, $[M - 14]^+$). Anal. calc. for $\text{C}_{12}\text{H}_{20}\text{O}_4\text{Si}$ (256.37): C 56.22, H 7.86; found: C 56.34, H 7.79.

(5R,6SR)-1,6-Bis[*isopropylidenedioxy*]-4,5-bis[*trimethylsilyl*]oxy]cyclohexa-1,3-diene ((±)-**15**). A soln. of TiOSiMe_3 (3.6 ml, 22 mmol) and Et_3N (3.1 ml, 22 mmol) in anhyd. PhH (20 ml) was added dropwise to a stirred soln. of (±)-**13** [28a] (921 mg, 5 mmol) and 1,4-diazabicyclo[2.2.2]octane (5.6 g, 50 mmol) in anhyd. PhH (30 ml). After heating to 80° for 24 h, the mixture was poured into a vigorously stirred mixture of sat. aq. NaHCO_3 soln. (50 ml), ice (100 g), and CH_2Cl_2 (100 ml). The aq. layer was extracted with CH_2Cl_2 (100 ml, twice). The org. extracts were combined, washed with sat. aq. NaCl soln. (50 ml, 3 times), and dried (MgSO_4). After solvent evaporation, the residue was purified by column chromatography on silica gel ($\text{AcOEt}/\text{hexane}$ 1:9), yielding 1.33 g (81%) of a colourless oil, b.p. 120°/10⁻² Torr. This unstable product was contaminated with aromatic impurities. IR (film): 3000, 2970, 2910, 1685, 1610, 1500, 1470, 1380, 1250, 1045, 925, 910, 840. $^1\text{H-NMR}$ (80 MHz, CDCl_3): 5.55 (d, $^3J = 10$), 5.33 (dd, $^3J = 10$, $^4J = 3$, H-C(2), H-C(3)); 4.63 (dd, $^3J = 10$, $^4J = 3$), 4.34 (d, $^3J = 10$, H-C(5), H-C(6)); 1.21, 1.18 (2s, Me_2C); 0.2 (s, 2 Me_3Si).

(4R,5SR,6RS)-6-Hydroxy-4,5-bis[*isopropylidenedioxy*]cyclohex-2-en-1-one ((±)-**16**). One drop of 1N HCl was added to a soln. of (±)-**14** (1.28 g, 5 mmol) in MeOH (50 ml). After 5 min at 20°, the mixture was poured into a vigorously stirred mixture of H_2O (100 ml), sat. aq. NaHCO_3 soln. (1 ml), and CH_2Cl_2 (100 ml). The org. phase was washed with sat. aq. NaCl soln. (50 ml, twice) and dried (MgSO_4). After solvent evaporation, the residue was recrystallized from hexane/ AcOEt yielding 0.65 g (71%) of colourless crystals. M.p. 152–153°. UV (dioxane): 322 (40), 214 (7500). UV (95% aq. EtOH): 321 (38), 211 (9800). $^1J(\text{C},\text{H}) = 148$; 27.4, 26.6 (2q, $^1J(\text{C},\text{H}) = 127$, $(\text{CH}_3)_2\text{C}$). MS (70 eV): 169 (76, $M^+ - 15$), 109 (58), 97 (100). Anal. calc. for $\text{C}_9\text{H}_{12}\text{O}_4$ (184.19): C 58.69, H 6.52; found: C 58.79, H 6.58.

1,2-O-(Isopropylidene)cyclohex-5-ene-1,2,3,4/0-tetrol ($= (\pm)-1,2\text{-O-(Isopropylidene)conduritol D; } (\pm)\text{-17}$). NaBH_4 (98 mg, 2.6 mmol) was added portionwise to a stirred soln. of $(\pm)\text{-16}$ (323 mg, 1.73 mmol) in 0.4M methanolic $\text{CeCl}_3 \cdot 7\text{H}_2\text{O}$ (5 ml, 2 mmol) at 0° . After 10 min at 0° , H_2O (15 ml) was added and the mixture extracted with AcOEt (100 ml, 3 times). The combined org. phases were washed with sat. aq. NaCl soln. (15 ml), dried (MgSO_4), and evaporated. The residue was filtered through a short column of silica gel (AcOEt /acetone 9:1) and recrystallized from Et_2O /hexane, yielding 239 mg (73%) of colourless crystals. M.p. $86\text{--}87^\circ$. IR (CHCl_3): 3570, 3040, 3000, 2940, 1385, 1230, 1085, 1035. $^1\text{H-NMR}$ (360 MHz, CDCl_3): 5.95 (br. ddd, $^3J = 9.6$, 4.5, $^4J = 1$, $\text{H-C}(5)$); 5.74 (ddt, $^3J = 9.6$, 2.7, $^4J = 5J = 1$, $\text{H-C}(6)$); 4.4–4.65 (m, $\text{H-C}(1)$, $\text{H-C}(2)$); 4.08 (dddd, $^3J = 10.8$, 4.5, 3.6, $^4J = 5J = 1$, $\text{H-C}(4)$); 3.80 (dddd, $^3J = 8.1$, 3.6, 2, $^5J = 1$, $\text{H-C}(3)$); 3.37 (d, $^3J = 8.1$, $\text{OH-C}(3)$); 2.84 (d, $^3J = 10.8$, $\text{OH-C}(4)$); 1.43, 1.34 (2s, Me_2C). $^{13}\text{C-NMR}$ (15.08 MHz, CDCl_3): 129.1, 127.5 (2d, $^1J(\text{C},\text{H}) = 164$); 110.5 (s), 76.7 (d, $^1J(\text{C},\text{H}) = 148$); 72.8 (d, $^1J(\text{C},\text{H}) = 152$); 66.8, 66.4 (2d, $^1J(\text{C},\text{H}) = 144$); 27.6, 25.9 (2q, $^1J(\text{C},\text{H}) = 126$). CI-MS (CH_4): 187 (5, $[M + 1]^+$), 171 (11, $[M - 15]^+$), 111 (100). Anal. calc. for $\text{C}_9\text{H}_{14}\text{O}_4$ (186.21): C 58.05, H 7.58; found: C 58.08, H 7.55.

Cyclohex-5-ene-1,2,3,4/0-tetrol ($= \text{Conduritol D; } 4$). A soln. of $(\pm)\text{-17}$ (186 mg, 1 mmol) in MeOH (3 ml) was added to 2N aq. HCl (3 ml). After stirring at 20° for 2 days, AcOEt (50 ml) was added and the mixture evaporated; this addition/evaporation was repeated twice, yielding 146 mg (100%) of **4** as a colourless oil. IR (film): 3340, 2900, 1635, 1560, 1400, 1250, 1155, 1095, 1045, 1015, 930, 905. $^1\text{H-NMR}$ (360 MHz, CD_3COCD_3): 5.87 (s, $\text{H-C}(5)$, $\text{H-C}(6)$); 4.7, 4.3 (2m, 4 OH); 4.22 (br. s, $\text{H-C}(1)$, $\text{H-C}(4)$); 3.94 (br. s, $\text{H-C}(2)$, $\text{H-C}(3)$). Anal. calc. for $\text{C}_6\text{H}_{10}\text{O}_4$ (146.14): C 49.31, H 6.90; found: C 49.46, H 7.03.

Tetra-O-acetylcyclohex-5-ene-1,2,3,4/0-tetrol ($= \text{Tetraacetylconduritol D; } 28$). A mixture of **conduritol D** (**4**; 146 mg, 1 mmol), pyridine (0.32 ml, 4 mmol), and Ac_2O (4 ml, 42 mmol) was allowed to stand at 20° for 2 h. After solvent evaporation, toluene (20 ml) was added and the mixture evaporated to dryness. This operation was repeated 3 times. The residue was filtered through a short column of silica gel (AcOEt /hexane 1:1) and recrystallized from Et_2O /hexane, yielding 298 mg (95%) of colourless crystals. M.p. $103\text{--}105^\circ$ ($[3]: 102\text{--}104^\circ$). IR (KBr): 2960, 1755, 1370, 1235, 1215, 1080. $^1\text{H-NMR}$ (80 MHz, CDCl_3): 5.91 (br. s, $\text{H-C}(5)$, $\text{H-C}(6)$); 5.56 (br. d, $^3J = 4$, $\text{H-C}(1)$, $\text{H-C}(4)$); 5.39 (br. d, $^3J = 4$, $\text{H-C}(2)$, $\text{H-C}(3)$); 2.05 (s, 4 AcO). Anal. calc. for $\text{C}_{14}\text{H}_{18}\text{O}_8$ (314.29): C 53.50, H 5.77; found: C 53.58, H 5.79.

1,2-Bis-O-[(tert-butyl)dimethylsilyl]-3-O-(trimethylsilyl)cyclohex-5-ene-1,2,3,4/0-tetrol ($(\pm)\text{-18}$). DIBALH (1.2M soln. in toluene; 1.7 ml, 2 mmol) was added dropwise to a stirred soln. of $(\pm)\text{-11}$ (prepared from $(\pm)\text{-10}$; 445 mg, 1 mmol) in anhyd. toluene (40 ml) cooled to -90° . After stirring at -80° for 6 h, MeOH (1 ml) was added dropwise and the mixture poured into a vigorously stirred mixture of CH_2Cl_2 (100 ml) and 10% aq. NH_4Cl soln. (100 ml) at 0° . The aq. phase was extracted with CH_2Cl_2 (100 ml, twice). The org. extracts were combined, washed with sat. aq. NaCl soln. (100 ml, 3 times), and dried (MgSO_4). After solvent evaporation, the residue was filtered through a short column of silica gel (Et_2O /hexane 1:2) yielding 433 mg (97%) of a colourless oil. IR (film): 3550, 3050, 2965, 2940, 2910, 2870, 1710, 1465, 1410, 1390, 1360, 1250, 1180, 1085, 1045, 1005. $^1\text{H-NMR}$ (360 MHz, CDCl_3): 5.93 (dm, $^3J = 5$, $\text{H-C}(5)$); 5.53 (br. d, $^3J = 5$, $\text{H-C}(6)$); 4.21, 4.01 (2m), 3.58 (br. d, $^3J = 2.5$, $\text{H-C}(1)$, $\text{H-C}(2)$, $\text{H-C}(3)$); 3.92 (m, $\text{H-C}(4)$); 3.38 (d, $^3J = 5.2$, $\text{OH-C}(4)$); 0.94, 0.90 (2s, 2 $t\text{-BuSi}$); 0.18, 0.15, 0.11 (3s, 2 Me_2Si , Me_3Si). MS (70 eV): 429 (5, $M^+ - 17$), 389 (14), 388 (15), 387 (35), 309 (18), 307 (13), 299 (24), 257 (13), 167 (13), 147 (40), 133 (10), 81 (10), 75 (100). Anal. calc. for $\text{C}_{21}\text{H}_{46}\text{O}_4\text{Si}_3$ (446.53): C 56.49, H 10.38; found: C 56.50, H 10.23.

$(-)-(1R,5R,6S)\text{-5,6-Bis}\{[(\text{tert-butyl})\text{dimethylsilyl}]\text{oxy}\}\text{-2-oxocyclohex-3-en-1-yl Acetate}$ ($(-)\text{-19}$). At 0° , 4-(dimethylamino)pyridine (85 mg, 0.7 mmol) was added to a soln. of $(-)\text{-12}$ (1.96 g, 5.27 mmol) in Ac_2O /pyridine 1:1 (10 ml). After stirring at 0° for 1 h, the mixture was poured in Et_2O (250 ml) and washed successively with 3N HCl (40 ml), 10% aq. K_2CO_3 soln. (80 ml), and sat. aq. NaCl soln. (50 ml). The aq. layers were extracted successively with Et_2O (100 ml). The combined org. phases were dried (MgSO_4) and evaporated. The solid obtained was recrystallized from $\text{MeOH}/\text{H}_2\text{O}$ to yield 1.8 g of white crystals, m.p. $104\text{--}106.5^\circ$. An other recrystallization ($\text{MeOH}/\text{H}_2\text{O}$) gave 1.69 g (77.5%) of white crystals, m.p. $107.5\text{--}109^\circ$. The combined mother-liquors were purified by column chromatography on silica gel (*Lobar*, Et_2O /petroleum ether 1:9) to give 380 mg (17.5%) of $(-)\text{-19}$ as white crystals, m.p. $105\text{--}107^\circ$ ($(\pm)\text{-19}$ obtained from $(\pm)\text{-12}$, m.p. $107\text{--}109^\circ$). $[\alpha]_{589}^{25} = -150$, $[\alpha]_{578}^{25} = -157$, $[\alpha]_{546}^{25} = -183$, $[\alpha]_{436}^{25} = -364$, $[\alpha]_{405}^{25} = -840$ ($c = 2.5$, CHCl_3). (-)-1*L*-3-*O*-Acetyl-4-*O*-benzoyl-1,2-bis-*O*-(*tert*-butyl)dimethylsilyl]cyclohex-5-ene-1,2,3,4/*tetrol* ((-)-**21**). Diethyl azodicarboxylate (1.05 ml, 6.7 mmol) was added dropwise to a soln. of (-)-**20** (1.58 g, 3.8 mmol), Ph_3P (1.83 g, 7 mmol), and benzoic acid (0.86 g, 7 mmol) in THF (20 ml). After 1 h at 20–25° (occasional cooling with a cold-water bath was necessary), Ph_3P (393 mg, 1.5 mmol), benzoic acid (183 mg, 1.5 mmol), and diethyl azodicarboxylate (0.22 ml, 1.4 mmol) were successively added. After 2 h at 20–25°, silica gel (10 g) was added, the mixture evaporated, and the resulting powder poured on the top of a small silica-gel column. Elution with Et_2O /petroleum ether 1:5 gave, after evaporation, an oil which was purified by column chromatography on silica gel (*Lobar*, Et_2O /petroleum ether 1:30) to yield (-)-**21** as a colourless oil (1.71 g, 87%); (±)-**21** obtained from (±)-**20**, m.p. 67–69°). $[\alpha]_{\text{D}}^{25} = -177$, $[\alpha]_{\text{D}}^{35} = -185$, $[\alpha]_{\text{D}}^{45} = -212$, $[\alpha]_{\text{D}}^{55} = -378$, $[\alpha]_{\text{D}}^{65} = -633$ (*c* = 6.5, CHCl_3). Anal. calc. for $\text{C}_{27}\text{H}_{44}\text{O}_6\text{Si}_2$ (520.81): C 62.27, H 8.52; found: C 62.35 H 8.43.

(-)-1*L*-Cyclohex-5-ene-1,2,3,4/*tetrol* (= (-)-*Conduritol* C; (-)-**3**). Bu_4NF (1*M* soln. in THF; 8 ml, 8 mmol) was added to a soln. of (-)-**21** (1.5 g, 2.9 mmol) in THF (40 ml) cooled to 0°. After stirring for 45 min at 0°, sat. aq. NaCl soln. (25 ml) was added and the mixture extracted with AcOEt (120 ml, 4 times). The org. extract was dried (MgSO_4), evaporated, and filtered through a 25-cm column of silica gel (AcOEt/petroleum ether 3:2). After evaporation, the eluate (820 mg) was dissolved in MeOH (20 ml), MeONa (30% soln. in MeOH; 0.3 ml, 1.6 mmol) added, and the mixture stirred for 15 min. Then, *Amberlite IR-120* (H^+ -form, 1.2 g) was added. After stirring for 5 min, the mixture was filtered and the *Amberlite* resin extracted with MeOH (15 ml, twice). The combined filtrate was evaporated and dried at 50°/0.03 Torr and the sirup obtained dissolved in warm MeOH (4 ml). Addition of

Et₂O (10 ml) caused the precipitation of colored impurities which were removed by filtration on *Celite*. The filtrate was left overnight at -35° to yield 195 mg of crystals, m.p. $121-123^{\circ}$. Recrystallization from MeOH/Et₂O gave 178 mg of white crystals, m.p. $129-130^{\circ}$. The combined mother-liquors were evaporated and the sirupy residue purified by 2 successive recrystallizations (MeOH/Et₂O) yielding 80 mg of colourless crystals, m.p. $129.5-131^{\circ}$ (total yield 61%). The *Celite* was extracted with hot MeOH (10 ml) and the filtrate combined with the mother liquors and evaporated. The sirupy residue obtained (150 mg, impure (–)-**3**) was acetylated yielding an additional 10% of the corresponding acetate (–)-**22** (*vide infra*). Data of (–)-**3**: ((±)-**3** obtained from (±)-**21**, m.p. $146-148^{\circ}$; [23]: $151.5-152^{\circ}$; [24]: $148-149^{\circ}$). $[\alpha]_{D}^{25} = -209$, $[\alpha]_{D}^{25} = -218$, $[\alpha]_{D}^{25} = -249$, $[\alpha]_{D}^{25} = -432$, $[\alpha]_{D}^{25} = -665$ ($c = 2$, H₂O). IR (KBr): 3400, 2900, 1430, 1140, 1050, 1020, 840. ¹H-NMR (360 MHz, CD₃OD): 5.64 (*dt*, ³*J* = 10.5, ³*J* = ⁴*J* = 2, H–C(5)); 5.55 (*ddd*, ³*J* = 10.5, 2, ⁴*J* = 2, 1, H–C(6)); 4.24 (*m*, H–C(4), H–C(1)); 4.01 (*ddd*, ³*J* = 2, 1.5, ⁴*J* = 1, H–C(2)); 3.51 (*br. dd*, ³*J* = 8, 1.5, H–C(3)). ¹³C-NMR (90.55 MHz, CD₃OD): 130.8 (*dd*, ¹*J*(C,H) = 160, ²*J*(C,H) = 5), 130.1 (*dm*, ¹*J*(C,H) = 162, C(5), C(6)); 76.2 (*dm*, ¹*J*(C,H) = 143); 73.9 (*dm*, ¹*J*(C,H) = 146); 70.7 (*dm*, ¹*J*(C,H) = 146); 69.5 (*br. dd*, ¹*J*(C,H) = 140, ²*J*(C,H) = 10). (1*RS*,2*RS*,3*RS*)-6-Oxocyclohex-4-ene-1,2,3-triyl Triacetate ((±)-**26**). A soln. of (±)-**12** (373 mg, 1 mmol), and Bu₄NF (1*M* soln. in THF, 2.2 ml, 2.2 mmol) in THF (5 ml) was stirred at 0° for 10 min. Pyridine (1.2 ml, 15 mmol) and Ac₂O (1.4 ml, 15 mmol) were added. After stirring at 0° for 1 h, then at 20° overnight, the mixture was poured in ice-water (30 ml) and extracted with CH₂Cl₂ (50 ml, 3 times). The org. extract was washed successively with 2*N* HCl (10 ml), 10% aq. K₂CO₃ soln. (15 ml), and sat. aq. NaCl soln. (15 ml). The aq. layers were extracted successively with CH₂Cl₂ (70 ml). The combined org. phases were dried (MgSO₄), evaporated, and purified by column chromatography on silica gel (AcOEt/hexane 1:1), yielding 235 mg (87%) of colourless crystals. M.p. $124-126^{\circ}$. IR (KBr): 3005, 2940, 1755, 1715, 1435, 1375, 1225, 1160, 1115, 1090, 1040, 1025, 960. ¹H-NMR (80 MHz, CDCl₃): 6.65 (*dt*, ³*J* = 10.5, 2, ⁴*J* = 2, H–C(4)); 6.23 (*dd*, ³*J* = 10.5, ⁴*J* = 2.5, H–C(5)); 5.90 (*m*, H–C(2), H–C(3)); 5.61 (*d*, ³*J* = 2.5, H–C(1)); 2.17 (*s*, AcO); 2.07 (*s*, 2 AcO). ¹³C-NMR (15.08 MHz, CDCl₃): 189.8 (*s*, C(6)); 170.0, 169.5, 169.4 (3*s*, 3 COO); 144.2 (*d*, ¹*J*(C,H) = 168, C(4)); 128.8 (*d*, ¹*J*(C,H) = 172, C(5)); 72.4, 72.3 (2*d*, ¹*J*(C,H) = 150); 68.0 (*d*, ¹*J*(C,H) = 148); 20.3, 20.2, 20.1 (3*q*, ¹*J*(C,H) = 130, CH₃CO). MS (70 eV): 270 (6, *M*⁺), 228 (4), 210 (3), 168 (25), 145 (7), 139 (22), 127 (9), 126 (100), 125 (15), 109 (7). Anal. calc. for C₁₂H₁₄O₇ (270.24): C 53.34, H 5.22; found: C 53.43, H 5.18.

Reduction of (±)-26 by NaBH₄/CeCl₃. NaBH₄ (115 mg, 3 mmol) was added portionwise within 10 min to a stirred soln. of (±)-**26** (338 mg, 1.25 mmol) in 0.4*M* methanolic CeCl₃·7H₂O (5 ml, 2 mmol) at 0° . After 15 min at 0° , the mixture was poured in ice-water (10 ml) and extracted with AcOEt (60 ml, 3 times). The combined org. phases were washed with sat. aq. NaCl soln. (15 ml), evaporated, and vacuum-dried ($25^{\circ}/0.1$ Torr). The residue was dissolved in CH₂Cl₂ (5 ml) and the soln. dried (MgSO₄); then pyridine (1 ml, 12 mmol) and Ac₂O (1 ml, 11 mmol) were added. After 2 h at 20° , the mixture was poured in ice-water (20 ml) and extracted with AcOEt (70 ml, 3 times).

The org. extract was washed successively with 2N HCl (10 ml), 10% aq. K_2CO_3 soln. (15 ml), and sat. aq. NaCl soln. (15 ml). The aq. layers were extracted successively with AcOEt (70 ml). The combined org. phase was dried ($MgSO_4$) and evaporated and the residue purified by column chromatography on silica gel (AcOEt/hexane 1:1). A first fraction yielded 201 mg (51%) of tetraacetylconduritol D (**28**) as white crystals, m.p. 103–105°. The second fraction yielded 138 mg (35%) of ($\pm$)-tetraacetylconduritol C (($\pm$)-**22**) as white crystals, m.p. 90–91°.
