## Stereocontrolled syntheses of (+)-uleine and (+)-dasycarpidone are achieved for the first time in an enantiocontrolled way starting from (+)-norcamphor.

Although a number of racemic syntheses of the uleine type indole alkaloids have been reported,<sup>1</sup> no enantiocontrolled synthesis has been disclosed to date. We report here the first stereo- and enantio-controlled construction of the representatives of this group, (+)-uleine **1** and (+)-dasycarpidone **2**, using (+)-norcamphor **3** as starting material (Scheme 1).<sup>2</sup>

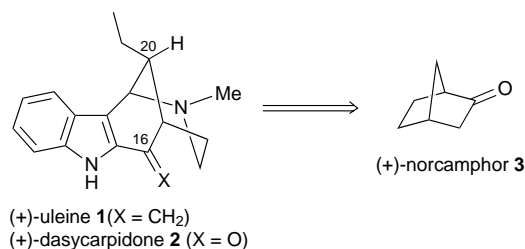

(+)-Norcamphor **3**† was first transformed into the  $\delta$ -lactone **4**<sup>3a</sup> which was then condensed with benzylamine to give the amide alcohol **5**,<sup>‡</sup> mp 94–95 °C,  $[\alpha]_D^{23} -1.95$  (c 0.55, CHCl<sub>3</sub>), in 75% yield. Hydride reduction of **5** followed by *N*-carbamoylation of the resulting amine yielded the carbamate **6**,  $[\alpha]_D^{27} -0.76$  (c 1.0, CHCl<sub>3</sub>), which was oxidized to give the cyclopentanone **7**,  $[\alpha]_D^{30} +58.0$  (c 0.9, CHCl<sub>3</sub>), in 90% overall yield. Transformation of **7** into the  $\alpha$ -diketone monothioether **8**, mp 72–74 °C,  $[\alpha]_D^{29} -43.5$  (c 0.742, CHCl<sub>3</sub>), followed by alkaline cleavage<sup>3–5</sup> yielded the acyclic methyl ester **9**,  $[\alpha]_D^{31} +43.1$  (c 0.3, CHCl<sub>3</sub>), in 59% overall yield after treatment of the resulting acid with diazomethane. Exposure of **9** to iodoethane in the presence of sodium hexamethyldisilazide in THF containing HMPA at –78 °C afforded the  $\alpha$ -ethyl ester **10** in 73% yield as an inseparable epimeric mixture with recovery of 14% of the starting material. The dithiane group of **10** was hydrolysed to give the aldehyde **11** in 92% yield which was treated with dimethyl 1-diazo-2-oxopropylphosphonate<sup>6</sup> in the presence of potassium carbonate to furnish the terminal acetylene **12** in 90% yield. Compound **12** was then converted into the 1,3-dioxane **14** in 72% overall yield *via* the aldehyde **13** by sequential reduction, oxidation and acetalization<sup>7</sup> (Scheme 2).

To construct the indole framework,<sup>8,9</sup> the acetylene **14** was first coupled with ethyl (2-iodophenyl)carbamate in the presence of dichlorobis(triphenylphosphine)palladium(II) [PdCl<sub>2</sub>(PPh<sub>3</sub>)<sub>2</sub>] and copper(I) iodide in triethylamine<sup>10</sup> to give the arylacetylene **15** in 86% yield. Cyclization was then carried out by treating **15** with sodium ethoxide in ethanol<sup>8,9</sup> at reflux to furnish the indole **17** in 64% yield accompanied by 31% of the de-*N*-acylated product **16** which, after separation, was treated with ethyl chlorocarbonate in pyridine to recover the carbamate **15** in 81% yield. The indole **17**, on reflux with TFA, afforded stereoselectively the tetracyclic amine **20**,  $[\alpha]_D^{29} -155.3$  (c 0.7, CHCl<sub>3</sub>), in 54% yield accompanied by the readily separable 20-epimer (4%) by spontaneous deacetalization, decarbamoylation and stereoselective cyclization. The observed stereo-

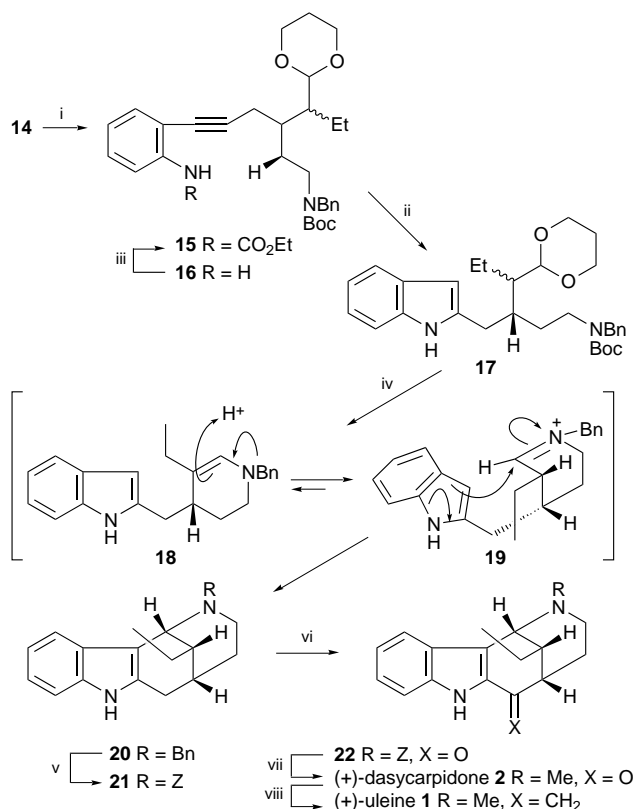

selectivity may be rationalised by intervention of the enamine intermediate **18** which allowed epimerization of the C-20 stereogenic centre and stereoselective generation of the iminium intermediate **19** followed by its stereoselective cyclization<sup>2a,b,d</sup> under the conditions. Since the amine **20** was found to be unstable under the oxidation conditions, it was first transformed into the carbamate **21**,  $[\alpha]_D^{28} +89.4$  (c 0.4, CHCl<sub>3</sub>), in 74% overall yield by sequential catalytic debenzylization and carbamoylation.<sup>2d</sup> The resulting carbamate **21** was then treated with pyridinium dichromate (PDC) on Celite in the presence of *tert*-butyl hydroperoxide (TBHP)<sup>11</sup> in benzene to afford the 16-ketone **22**,  $[\alpha]_D^{28} +231.8$  (c 0.2, CHCl<sub>3</sub>), in 54% yield. Concurrent *N*-deprotection and *N*-methylation of **22** under the reductive conditions<sup>2d</sup> in the presence of 37% formalin afforded (+)-dasycarpidone **2**,  $[\alpha]_D^{30} +63.1$  (c 0.7, CHCl<sub>3</sub>) [natural:  $[\alpha]_D^{26} +64.7$  (c 1.02, CHCl<sub>3</sub>)],<sup>12</sup> in 83% yield. By following the established procedure,<sup>2a,b</sup> (+)-dasycarpidone **2** obtained was transformed into (+)-uleine **1**,  $[\alpha]_D^{27} +18.2$  (c 0.3, CHCl<sub>3</sub>) [natural:  $[\alpha]_D^{25} +16.5$  (c 0.91, CHCl<sub>3</sub>)];<sup>12</sup>  $[\alpha]_D^{27} +20$  (c 0.94, CHCl<sub>3</sub>)<sup>13</sup>], in 71% overall yield on treatment with methyl-

**Scheme 2** Reagents and conditions: i, BnNH<sub>2</sub>, 180 °C (75%); ii, LAH, THF, reflux; iii, Bo<sub>2</sub>O, aq. NaOH, room temp. (95%); iv, pyridinium chlorochromate (PCC), NaOAc, CH<sub>2</sub>Cl<sub>2</sub> (95%); v, pyrrolidine, benzene, reflux, then TsS(CH<sub>2</sub>)<sub>3</sub>STs, Et<sub>3</sub>N, MeCN (59%); vi, KOH, BuOH, 60 °C, acid workup, then CH<sub>2</sub>N<sub>2</sub> (99%); vii, NaN(SiMe<sub>3</sub>)<sub>2</sub>, EtI, THF, HMPA, –78 °C (73%, recovery of 14% of **9**); viii, Hg(ClO<sub>4</sub>)<sub>2</sub>, CaCO<sub>3</sub>, 20% aq. THF (92%); ix, AcC(=N<sub>2</sub>)P(O)(OMe)<sub>2</sub>, K<sub>2</sub>CO<sub>3</sub>, MeOH, room temp. (90%); x, LAH, THF; xi, Swern oxidation (87%); xii, Me<sub>3</sub>SiO(CH<sub>2</sub>)<sub>3</sub>OSiMe<sub>3</sub>, Me<sub>3</sub>SiOTf (cat.), THF, –78 °C (83%)

**Scheme 1**

**Scheme 3** Reagents and conditions: i,  $\text{PdCl}_2(\text{PPh}_3)_2$  (10 mol%),  $\text{CuI}$  (10 mol%), 2- $\text{IC}_6\text{H}_4\text{NHCO}_2\text{Et}$ ,  $\text{Et}_3\text{N}$ , reflux (86%); ii,  $\text{NaOEt}$ ,  $\text{EtOH}$ , reflux (**16**: 31% and **17**: 64%); iii,  $\text{ClCO}_2\text{Et}$ , pyridine (81%); iv,  $\text{TFA}$ , reflux (54%; 20-epimer 4%); v, 10%  $\text{Pd-C}$ ,  $\text{HCO}_2\text{NH}_4$ ,  $\text{MeOH}$ , reflux, then  $\text{ClCO}_2\text{Bn}$ ,  $\text{K}_2\text{CO}_3$ ,  $\text{CH}_2\text{Cl}_2$  (74%); vi,  $\text{PDC-Celite}$ ,  $\text{TBHP}$ , benzene, room temp. (54%); vii,  $\text{H}_2$ , 10%  $\text{Pd-C}$ , 37% formalin,  $\text{MeOH}$  (83%); viii,  $\text{MeLi}$ ,  $\text{THF}$ , then neutral  $\text{Al}_2\text{O}_3$  (activity I), 120 °C (71% overall)

lithium followed by dehydration of the resulting tertiary alcohol with neutral alumina.
