## Synthese D'une Serie de *N*-Alkyl et *N*-Aroxysulfonylcarbamates de 1-*F*-Alkyl-2-Thiophenylethyle

I. Chehidi, H. Zoghlami, and A. Baklouti

Laboratoire de Chimie Structurale Organique, Faculté des Sciences de Tunis, Campus Universitaire, Tunis, Tunisie

*The action of 1-F-alkyl-2-thiophenylethanols on substituted isocyanates gives the corresponding 1-F-alkyl-2-thiophenylethyl-N-alkyl and N-aroxysulfonyl-carbamates in good yields. The reaction was performed in dichloromethane under nitrogen atmosphere at room temperature.*

**Keywords** Carbamates; *F*-alkylthiophenylethanols; isocyanates

### INTRODUCTION

La réaction d'addition des composés hydroxylés sur les isocyanates conduit aux carbamates correspondants dont les propriétés pesticides,<sup>1</sup> herbicides,<sup>2</sup> anti-cancéreuses,<sup>3–6</sup> et anti-sida<sup>7</sup> ont été bien établies. De nombreux travaux réalisés dans notre laboratoire ont été consacrés à l'étude de la réactivité des isocyanates d'aroxy et d'alcoxy sulfonyle vis-à-vis de divers nucléophiles comme les thiols,<sup>8</sup> les alcools *F*-alkylés,<sup>9</sup> les diols *F*-alkylés,<sup>10</sup> les amines hautement fluorées,<sup>11</sup> les aminoalcools polyfluorés<sup>12</sup> ainsi que le 1-*F*-octyl-2-fluoroéthanol.<sup>13</sup> Dans le même ordre d'idées, nous avons fait réagir des 1-*F*-alkyl-2-thiophénylethanols sur une série d'isocyanates diversement substitués ce qui nous a permis de synthétiser une série de carbamates possédant les groupements *F*-alkyle et thiophényle.

### RESULTATS ET DISCUSSION

Les nucléophiles s'additionnent sur les isocyanates et conduisent aux produits d'addition nucléophile correspondants. Dans le cas des alcools

Received January 6, 2007; accepted July 6, 2007.

l'addition nucléophile sur les isocyanates donne des carbamates selon la réaction:

R= alkyle, aryle

R<sub>1</sub>= alkyle, aryle, aroxysulfonyle, chlorosulfonyle

### SCHÉMA 1

Lorsque l'alcool est tertiaire et encombré comme l'adamantan-1-ol<sup>14</sup> ou le tertiotbutanol<sup>15</sup> et en présence d'isocyanates N-sulfonylés, les carbamates obtenus subissent une décarboxylation et se transforment en sulfamates.

Pour les 1-*F*-alkyl-2-thiophényléthanols, la réaction d'addition nucléophile fournit les carbamates correspondants selon le mécanisme réactionnel suivant:

### SCHÉMA 2

Le schéma 2 ci-dessous résume les résultats obtenus:

Vis-à-vis du chlorosulfonylisocyanate, le comportement de ces 1-*F*-alkyl-2-thiophényléthanols est différent de celui des autres alcools simples ou *F*-alkylés. Avec les alcools simples la réaction se traduit après chauffage, par la formation des alcoxysulfonylisocyanates correspondants dont l'obtention est due d'après les données de la littérature à la série d'équilibres suivants:

**SCHÉMA 3****SCHÉMA 4**

Etant donné que les chlorosulfonylcarbamates ont été isolés à basse température, nous pensons qu'à haute température il y a transformation de ces produits d'addition conformément au mécanisme ci-dessous plutôt que retour à l'équilibre initial.

**SCHÉMA 5**

Cette transformation qui débute par une  $S_Ni$  n'a pas lieu avec les 1-*F*-alkyl-2-thiophényl-éthanols à cause probablement du phénomène d'encombrement stérique des groupements *F*-alkyle et thiophényle. Par contre le caractère très hygroscopique du chlorosulfonylcarbamate entraîne, en présence d'humidité, la formation du carbamate correspondant, suite à l'hydrolyse du groupement chlorosulfonyle, conformément au schéma:

**SCHÉMA 6**

Le Tableau I regroupe l'ensemble des carbamates que nous avons synthétisés.

Avec les aroxsulfonylisocyanates les rendements sont élevés et les temps de réaction courts comparés à ceux des isocyanates simples. Cela pourrait être expliqué par la présence du groupement sulfonyle qui augmente le caractère électrophile du carbone de l'isocyanate.<sup>14</sup>

## PARTIE EXPERIMENTALE

Les spectres RMN ont été réalisés sur un appareil Brucker AC300 à 300 MHz pour  $^1H$ , 75 MHz pour  $^{13}C$  et 282 MHz pour  $^{19}F$ . L'attribution des signaux des groupements difluoro-méthylènes des chaînes  $R_F$  est effectuée selon:  $CF_3-CF_{2(7)}-CF_{2(6)}-CF_{2(5)}-CF_{2(4)}-CF_{2(3)}-CF_{2(2)}-CF_{2(1)}$ . Les spectres IR ont été enregistrés sur un appareil Perkin Elmer Paragon 1000PC.

Les phénylisocyanates, *n*-butyliisocyanate, cyclohexylisocyanate, et chlorosulfonylisocyanate sont des produits commerciaux. Les aroxsulfonylisocyanates ont été préparés par action des phénols correspondants sur l'isocyanate de chlorosulfonyle.<sup>16,17</sup> Les 1-*F*-alkyl-2-thiophényléthanols sont obtenus par réaction d'ouverture des époxypropanes *F*-alkylés par le thiophénol en présence de triton B.<sup>18</sup>

## Synthèse des *N*-alkyl et *N*-aroxy sulfonylcarbamates de 1-*N*-alkyl-2-thiophénylethyle

A 10 mmol d'isocyanate dissous dans 10 mL de dichlorométhane anhydre, on ajoute 10 mmol de 1-*F*-alkyl-2-thiophénylethanol dissous dans 10 mL du même solvant. Le milieu réactionnel est maintenu sous agitation à la température ambiante et sous atmosphère d'azote, pendant trois heures pour les alkylisocyanates et trente min pour les aroxyisocyanates. On évapore ensuite le solvant sous vide et on sépare les produits par chromatographie sur colonne de gel de silice en utilisant comme éluant le mélange (éther diéthylique/éther de pétrole: 30/70). On recristallise enfin les produits dans le cyclohexane.
